They are a kind of small ponies, locally called *merlyns*, a very hardy race, which ranging at large over the mountains till they are three years old, are then brought down for sale. They are much used by salesmen for conveying manufactured articles through the country. In traversing the mountains and climbing their steep ascents they are singularly useful. From a cross between these merlyns and the English horse has arisen a larger breed, hardy, active, and rather handsome, and the vales have for centuries been noted for a very fine breed, which is traced to the introduction of some Spanish blood horses by Robert Earl of Shrewsbury. The ordinary crops raised in this County are oats, barley, wheat, and rye: green crops to alternate with these have long been introduced; they are not, however, as yet universally adopted, and many farmers continue the old routine of oats, wheat, barley, &c. till the fertility of the land is exhausted. In the Eastern part of the County hemp is much grown. Montgomeryshire is the best wooded County in North Wales, and was once far more covered with trees than at present. Much oak has within the last fifty years been cut down for the use of the dockyards. The raising of new trees to supply this waste has been greatly neglected.

Flannel is the only manufacture, except a few cloths at Machynlleth. The County is divided into 9 Hundreds and 49 Parishes, and is distributed among the three Dioceses of Bangor, Hereford, and St. Asaph. It sends two Representatives to Parliament, one for the County, one for the Town of Montgomery. Population, in 1821, 58,889. At the time of the Roman invasion, Montgomeryshire was inhabited by the *Ordovices*, who long baffled the conqueror, till they were subdued by Agricola. Under the Anglo-Saxon Government, it was included in Powys-land, and the dyke which Offa, King of Mercia, raised against the subjects of that Kingdom whom he had chased from Shropshire, witnessed many sanguinary engagements. On the separation of Powys-land into two Principalities, Montgomeryshire by itself formed one under the title of Powys Wenwynnyn, and the little village Meifod, the Roman *Mediolanum*, became the residence of the Powys Kings. After the Norman Conquest, the County was sometimes called Sir Tre Faldwyn, from Baldwyn, a Lieutenant of the Marches, who partially subdued it, till at the division of Wales into Counties, in the reign of Henry VIII., it received its present name, from Roger de Montgomery, the Norman founder of the castle in its chief town.

Montgomery, a Borough, and the County Town, was founded by the above-mentioned Baldwyn, but greatly increased by Roger de Montgomery, Earl of Arundel and Shrewsbury, to whom William the Conqueror assigned all conquests Westward of the Severn. The Castle, which was dismantled by the Parliament during the Great Rebellion, stood on a lofty and precipitous eminence on the North, naturally inaccessible on one side, and protected on the other by four deep fosses dug out of the solid rock. At present one shattered tower and a few low walls are its only remains. An ancient British camp of great strength and extent, stands on a hill in its neighbourhood. The town itself was once walled, but few traces of those works can now be discovered, which indeed were ruined in the time of Leland. It was created a Borough by Edward III., and has returned one Member to Parliament since the 27th Henry VIII. The houses are built partly on a slope to the South-Eastern bed of the Severn, partly on the summit of a

MONTGOMERYSHIRE.

Statistics.

History.

Montgomery.

MONT- GOMERY-SHIRE. hill above, and the general aspect is clean and neat. The Church of St. Nicholas is cruciform, and of pointed architecture, and contains a rich altar-tomb of Richard Herbert, and Magdalene, his wife, parents of Edward Lord Herbert of Cherbury, who was born in the town. The only other public buildings are a Guildhall and the County Gaol. Population, in 1821, 1062. Distant 26 miles S. W. from Hereford, 161 N. W. from London.

Llanfyllin. *Llanfyllin*, a market town on the South-Eastern bank of the Severn, is entered by a long, mean, wooden bridge, the situation is pleasant, and the streets composed chiefly of houses with mud walls in wooden framework, are broad, and at right angles to each other. The Church of St. Ydlos has a curious roof of carved oak. The town has a considerable trade in flannel. Population, in 1821, 3145. Distant from Newton 13 miles N. W., from Plinlimmon 7, from London 190 W. by N.

Machynlleth. *Machynlleth*, at the confluence of the Dulas with the Dovy, surrounded by mountains, is a well-built market town, supposed to have been a Roman station, the *Maglona* of Antoninus. An old house, now, alas, a stable, is shown as the building in which Owen Glendower convened a Parliament, and was formally crowned. Near Penalt, about two miles distant, is a Roman fort of great strength and distinction, now known as Cefn Caer. Tanning, the manufacture of flannel and of a coarse white cloth, employ the labouring inhabitants. Population, in 1821, 1595. Distant 12 miles N. E. from Aberystwith, 206 N. W. from London.

Newton. *Newton*, a market town on the Severn, is called in Welsh *Trenavdydd*; it is neat and clean, and the neighbouring country is picturesque. Population 3486. Distant 7 miles S. W. from Montgomery, 175 W. by N. from London.

Welsh Pool. *Welsh Pool*, so named in distinction from Pool, in Dorsetshire, and from its neighbourhood to Llyndy Pool, is a large market town at the foot of a hill near the Severn, which is navigable to Pool Quay, about three miles below the town. It has a handsome Town Hall, and is the chief mart for flannels made in the County. Population, in 1821, 3460. Distant 18 miles W. from Shrewsbury, 169 from London. About a mile without the town stands Powys Castle, the seat of the noble family of Clive; and Offa's Dyke runs on the opposite bank of the Severn.

Llanfair. *Llanfair*, on a steep hill on the banks of the Virnwy, population 2514, distant from Newton 14 miles N., from London, 180 W. by N., and *Llanfyllin*, distant 24 miles W. from Shrewsbury, 191 W. by N. from London, are two other market towns.

MONTH, 1. *Month*; Goth. *menath*,
MO'NTHLY, adj. *menoth*; A. S. *monath*; Ger.
MO'NTHLY, adv. *mond*; D. *maend*; Sw. *mænad*.
MONTH'S-MIND, 2. *Moon*; Goth. *mena*; A. S.
MOON, *mona*; Ger. *mon*; D. *maene*;
MO'ONCALF, Sw. *maene*; Kilian, and after
MO'ONET, him Wachter, derives the latter
MO'ONISH, class from *mæn-en*, (A. S. *mon-*
MO'ONLESS, *ian*), *monere*. Wachter supports
MO'ONLIGHT, his opinion by reference to the
MO'ONLING, regard which was paid to the
MO'ONSHINE, *moon*, and her changes by our
MO'ONSHINY, German ancestors, and adds, the
MO'ONY. *moon* warns or *admonishes* the
 husbandman of the seasons for sowing and planting, and
 of other things pertaining to Agriculture, as recorded by
 Cæsar and Tacitus. (See the Quotations from them.)

three doubts. Tooke says that *month* (anciently written *MONTH* *moneth*) means—the period in which that planet, the *moon*, *moneth*, or *compleateth its orbit*. But this decides nothing as to the origin of the word *moon*; to *mone* or *moon* may be a verb or usage of a verb formed upon the noun, and signify merely to be, or become, or cause to be a *moon*, and consequentially, to complete the orbit of that planet.

But why is *moon* so called? Wachter seems to give the best reason, and Dr. Jamieson adopts his Etymology: the names which were given to some of the *months* may help to confirm their judgment. Such are *mede-month*, *weed-month*, *harvest-month*.

Spelman calls *month-day*, *lamentatio mensurna*; and Somner, *gemynd-dæg*, *dies commemorationis*, that day which our ancestors called their *moneths-mind*, their year's mind, and the like: being a day wherein their soules (after their deaths) were had in special remembrance, and some office or obsequies done for them; such as obits, trentals, &c.

A *mooncalf* is an imperfect fœtus, so called, because it is supposed to be occasioned by the influence of the *moon*. Hence it became a term of reproach. In Drayton's Poem so named, a fashionable man of the Poet's times is supposed to have been engendered by an Incubus on the World herself.

Elye

In Israel prophete was, and in oure Lord bigan to crie,
 þat þer ne schulde þre ȝer ne six *monethes* þer to
 No reyn no come on erþe, and yt bi fel al so.

Nor shun'd, at pensive eve, with lonesome pace,
The cloister's *moonlight* checquer'd floor to trace.

Warton. *On the Birth of the Prince of Wales*.

Of the original application of the phrase, a MONTH'S MIND, (in the citation above from Fabian,) we have spoken under FUNERAL RITES, p. 390; and we may here add, that Polydore Vergil traces the ceremony to the similar *Novendiale* observed by the Romans, which was changed by the Christians generally, to a commemoration of the dead on the seventh day after burial, (*Septemdiale*) and by the English particularly, to one at the close of a Month. *Hinc igitur apud nos hodie mortuorum justa septimo die a funere, demptis ex veterum instituto illis duobus diebus fiunt: ideoque in Canonicis decretis distinctione 44 præcipitur, "Nullus Presbyter ad Septemdialia defuncti solennia celebranda vocatus, se inebriare ullatenus audeat: quandoquidem tunc largiter epulantur." Apud Anglos hoc fit vigesimo nono die postquam mortuus est sepultus. (De Invent. vi. 10.)* But this Ceremonial has not any reference whatever to the commoner usage of the words, as they are employed by Julia in the *Two Gentlemen of Verona*, "I see you have a Month's Mind to them;" concerning which Mr. Douce justly says, "there is a great deal of quotation given in the notes, but nothing after all that amounts to an explanation of the term." Neither does Mr. Douce himself explain it as there applied. Johnson's commentary is wholly unintelligible to us:—"A Month's Mind, in the ritual sense, signifies not desire or inclination, but remonstrance; yet I suppose this is the true original of the expression." In what way the ritual sense expresses remonstrance we have yet to seek. The other annotators simply notice the "Anniversary," as some of them strangely call these *Parentalia* at the Month's end.

Brand, after noticing the steps between Month's Mind, Minnyng Days, and the Saxon Lemynbe Days, adds very boldly, "The common expression of having a Month's Mind, implying a longing desire, is evidently derived from hence." The following notice from Peck's *Desiderata Curiosa*, (i. 230.) subjoined in a note, is still more perplexed and more whimsical. "By saying they have a Month's Mind to it, they anciently must undoubtedly mean, that if they had what they so much longed for, it would (hyperbolically speaking) do them as much good (they thought) as they believed a Month's Mind, or Service said once a Month, (could they afford to have it,) would benefit their souls after their decease." Now, a Month's Mind, as we have seen, is not a Service said once a Month; and even if it were so, few would be inclined to admit (notwithstanding the illumination afforded by the parentheses) the above rambling account. Never, indeed, is an Antiquary or an Etymologist so greatly to be mistrusted, as when he commences with *Evidently* or *Undoubtedly*.

Archdeacon Nares saw the futility of all these explanations, and we think has succeeded far better. "But *Month's Mind* is much more commonly used, and is not yet quite disused in the sense of 'an eager desire or

MONTH.

MONTH. longing.' Between these two significations there is no imaginable connection; for, even granting that the Funeral feast might be an object of eager desire to those who were to attend the celebration, yet no use of language would lead persons to say, that they had a *Month's Mind*, when they only meant to say that they were desirous to have it, or to be at such a ceremony. Some other explanation of the phrase, in the latter sense, must therefore be required; and it seems to have been well supplied by the ingenious conjecture of a gentleman, who published a few detached remarks on Shakespeare, John Croft, Esq. of York. He explains it to allude to 'a woman's longing, which,' he says, 'usually takes place (or commences, at least) in the first month of pregnancy,' *Rem.* p. 2. Unfortunately he gives no authority for it, and I have endeavoured in vain to find it in that mode of application. Yet it accords so perfectly with this second sense that I have no doubt of its being the true explanation." Then, after a few citations, Mr. Nares continues: "Now what possible connection can any of these have with the celebration of the dead? To give a ludicrous sense to a combination common on more solemn occasions, might have been one inducement to adopt the latter phrase, but it must have been founded on something that made it proper in the lighter sense, and something also that authorized the Spectator to say you *have* such a Mind. And what more probable origin can be imagined than the longing of a woman in the first month of pregnancy, a subject of such common remark? 'You long for it like a woman with child.'"

MONTIA, in *Botany*, a genus of the class *Triandria*, order *Trygynia*, natural order *Portulacæ*. Generic character: calyx two-leaved; corolla of one-petal, irregular capsule one-celled, three-valved.

One species, *M. fontana*, native of the neighbourhood of springs in Europe.

MONTICULARIA, in *Zoology*, a genus of *Polypi*. Generic character. Fixed, stony, incrusting marine bodies, united into a subglobular, gibbous, or lobed mass, or subfoliaceous expansions; upper surface rough with elevated pyramidal stellæ; stars conical, with a solid central axis, simple or dilated, around which the radiating laminæ adhere.

Type of the genus, *M. folium*, Lamarck. Inhabits the Indian Seas, and there are several fossil species.

MONTINIA, in *Botany*, a genus of the class *Dioecia*, order *Tetrandria*, natural order *Onagræ*. Generic character: male flower, calyx four-toothed; corolla petals four: female flower, style two-cleft; stigma kidney-shaped; capsule inferior, two-celled, many-seeded.

One species, *M. acris*, native of the South of Africa.

MONTSERRAT, one of the Leeward Caribbean Islands, so named by Columbus, who discovered it in 1493, from a fancied resemblance to the face of the Country near the Mountain of the same name in Catalonia. It was not colonized, however, till 1632, when Sir Thomas Warner, the English Governor of St. Christopher's, sent thither a small band of adventurers. It prospered rapidly, but was ravaged by the French when they became masters of Antigua in 1668, and in 1712 it underwent a similar calamity. The Island is about three leagues both in length and breadth, and contains 30,000 acres, nearly two-thirds of which are mountainous and unfit for culture; the rest is well watered and fertile. The products and exports are similar to those of other West Indian Islands; Sugar,

Rum, Molasses, Indigo, Cotton, and Dyeing Woods. It is divided into four districts, each sending two Members to an Assembly; besides which, the Captain General is assisted by a Council of six. Latitude N. 16° 45'; longitude W. 61° 6'.

MONUMENT, } Fr. *monument*; It. and Sp. *monumento*; Lat. *monumentum*; }
MONUMENTAL, }
MONUMENTALLY. } *quidquid est scriptum aut factum memorie causa*, Var. lib. iii. From *monere*, to call to mind, to remind, (says Vossius,) is *monimen*, and anciently *monumen*, whence *monumentum*.

Any thing made or done, with a meaning or intention to call to mind or memory, to remind, in remembrance or memory.

Any thing raised or erected in memory of.

And no doubt for selfe fayth in visityng the *monumentes* of Christ, therefore hath God also destroyed them, and geuen the place vnder the infidels.

Tyndall. Workes, fol. 283. *An Answer to Sir Thomas More's Dialogues*.

But wicked Time, that all good thoughts doth waste,
 And works of noblest wits to nought outweare,
 That famous *moniment* hath quite defaste.

Spenser. Faerie Queene, book iv. can. 2.

Some others were new driven, and distent
 Into great ingowes and to wedges square;
 Some in round plates withouten *moniment*.

MOOR.
—
MOOT.

MOP.
—
MOPE.

MOP. *Mops* and *mows* appears to be a familiar expression with our old Dramatic Writers; the former word applied to some action of *mocking*, and sometimes confounded with *mock*; but the origin is not known. The Sw. has *mopa*, *illudere*; but that itself requires to be accounted for.

What *mops* and *mows* it makes! high! how it frisketh!
Is't not a fairy, or some small hobgoblin?

Beaumont and Fletcher. *The Pilgrim*, act iv. sc. 2.

MOP, } Perhaps a *mob*; (see **MOB**;) and so
MO'PPET. } called from the looseness, *movableness* of the parts.

Moppet, the diminutive, applied to a puppet, plaything, fondling.

The water, that was employed to wash them, being thinly spread with a *mop*, would presently congeal.
Boyle. *Works*, vol. ii. p. 654. *The Experimental History of Cold*, tit. 21.

ANT. Did one ever hear a little *moppet* argue so perversely against so good a cause!
Dryden. *Don Sebastian*, act iii. sc. 2.

MOPE, v. } Skinner says, *Obstupescere, mutum*
MOPE, n. } *et ignavum incedere*; to move silent
MO'PISH, } and sluggish.

MO'PISHLY, } To move silent and sluggish; to
MO'PISHNESS. } be or cause to be silent and sluggish,
inert, inactive; to stupify, to be or become stupid.

See where yon little *moping* lamb of mine
Itself hath tangled in a crawling briar.

Drayton. *Pastorals*. Eclogue 6.

He is bewitch'd or *mop'd*, or his brains melted,
Could he find no body to fall in love with.

Beaumont and Fletcher. *The Humorous Lieutenant*, act iv. sc. 6.

On a trice, so please you,
Euen in a dreame, were we deuic'd from them,
And were brought *moaping* hither.

Shakspeare. *Tempest*, fol. 18.

Dæmoniac phrenzie, *moaping* melancholie,
And moon-struck madness.

Milton. *Paradise Lost*, book xi. l. 485.

Many men are undone by this means, *moped*, and so dejected,
that they are never to be recovered.

Burton. *Anatomy of Melancholy*, fol. 150.

They will be scoffing, insulting over their inferiours, till they have made by their humoring or gulling, *ex stulto insanum*: a *mope*, or a noddy, and all make themselves merry.

Id. *Ib.* fol. 149.

Here one *mopishly* stupid, and so fixed to his posture, as if he were a breathing statue.

Hall. *Works*, vol. iii. fol. 435. *The Spirituale Bedleem*, sol. 29.

What goodness can there be in the world without moderation, whether in the use of God's creatures, or in our own disposition and carriage? Without this, justice is no other than cruell rigour; mercy, unjust remissnesse; pleasure, brutish sensuality; love, frenzy; anger, fury; sorrow, desperate *mopishnesse*; joy, distempered wildnesse; knowledge, saucy curiosity; piety, superstition; care, wracking distraction; courage, mad rashnesse.

Id. *Ib.* vol. iii. fol. 1. *Christian Moderation*, book i. sec. 1.

What a *mop-eyed* ass was I, I could not know her.

Beaumont and Fletcher. *The Pilgrim*, act iii. sc. 3.

But full of museful *mopings*, which presage
The loss of reason, and conclude in rage.

Dryden. *Palamon and Arcite*, book i.

Are these the comforts of a wife,
This careful, cloister'd, *moaping* life.

Brookes. *Fables*. *The Sparrow and the Dove*.

It directs him not to shut himself up in a cloister, alone, there to *mope* and moan away his life; but to walk abroad, to behold the things which are in heaven and earth, and to give glory to Him who made them.

Horne. *Works*, vol. v. p. 337. *Discourse* 23.

MOQUILEA, in *Botany*, a genus of the class *Icosandria*, order *Monogynia*, natural order *Rosaceæ*. Generic character: calyx top-shaped, with five acute teeth; corolla, petals five, roundish; stamens numerous, longer than the corolla; germen hirsute; stigma obtuse.

One species, a tree, native of the woods of Guiana. Decandolle.

MORÆA, in *Botany*, a genus of the class *Triandria*, order *Monogynia*, natural order *Irides*. Generic character: corolla, six petals, spreading; stigmas three to six, thread-shaped; capsule oblong.

A genus of elegant bulbous-rooted plants, containing thirteen species, natives of the South of Africa.

MORAL, adj.

MORAL, n.

MORAL, v.

MORALER,

MORALIST,

MORA'LITY,

MORALIZE,

MORALIZA'TION,

MORALLY.

Fr. *moral*, *moralizer*; It. *morale*, *moralizare*; Sp. *moral*, *moralizar*; Lat. *moralis*, from *mos*, which Martinius thinks is from *meare*, to go,—signifying *via*, a way. See **IMMORAL**.

A *moral* man is a man whose way of life, whose mode or manner of acting is guided or governed by the laws of natural or revealed religion. A *moral* act; an act consistent with those laws. And thus *morality*, generally,

Obedience to, consistency with, those laws which guide or govern the mode or manner of action of men as social beings. And hence the Science of *morals* is

That Science which teaches men their duty, and the reasons of it.

Moral is also distinguished from Physical or Mathematical; e. g. a *moral* certainty, from a certainty arising from the evidences of the senses, or from Mathematical demonstration. See the second Quotation from Locke.

To *moralize*; to be or cause to be *moral*; or of a *moral* nature or character; to treat or deliberate *morally* or upon *morals* or *moral* topics.

O *morall* Gower, this booke I direct
To thee, and to thy philosophicall Strode.

Chaucer. *The Testament of Creseide*, p. 294.

Forsoth o maner gentrie is for to preise, that appareilleth mannes corage with vertues and *moralitees*, and maketh him Christes child.

Id. *The Persones Tale*, p. 155.

Or though a man of high or low degree,
Of Tullius had the sugred eloquence,
Or of Seneca the *moralitee*.

A Ballad of Good Counsaill, p. 556. Imputed to Chaucer.

Wherof ensamples ben enowe
Of hem, that thilke *merell* drowe.

Gower. *Conf. Am.* book vii. p. 231.

They do constur in diners sēses almost euery text in scripture, sometime after the letter, sometime *moral*, & sometime otherwise, and al to the profit and edifyng of the hearers.

Sir Thomas More. *Workes*, fol. 322. *The Supplication of Soules*.

By the tyme that the chylde doth come to xvii. yeres of age, to the intent his courage be bryddled wyth reason, it were nedfull to rede vnto hym some warkis of phylosophy, spicially that parte that maye enforme hym vnto vertuous maners, whiche parte of phylosophy is called *moral*.

Sir Thomas Elyot. *The Governour*, book i. ch. xi.

It is more commendable, and also cōmodious, if the players haue red the *moralization* of the chesse, and wha they playe do thynke vpon it: which bokes be in Englysh.

Id. *Ib.* book i. ch. xxvi.

When I did heare
The motley foole, thus *morale* on the time,
My lungs began to crow like Chanticiere,
That fooles should be so deep contemplatiue.

Shakspeare. *As You Like It*, fol. 193.

MOQUI-
LEA.

—
MORAL.

MORAL.

IAGO. Come, you are too severe a moraliser.

Shakspeare. *Othello*, fol. 321.

MORASS.

The wisest and most resolute moralist that ever was, lookt pale when hee should taste of his hemlock; and by his timorousnesse made sport to those that envied his speculations.

Hall. *Works*, vol. i. fol. 67. *Heaven upon Earth*, sec. 3.

The end of morality, is to procure the affections to obey reason, and not to invade it.

Bacon. *Works*, vol. i. fol. 87. *Of the Advancement of Learning*, book ii.

If, then, the original itself was extant for so long a time, it was easy to compare the copies with it, and morally impossible but that the curiosity or religious care of many, should make them to do it.

Grew. *Cosmo Sacra*, book iv. ch. i.

Fierce warres and faithful loves shall moralize my song.

Spenser. *Faerie Queene*, book i. stan. 1.

Nature surely (if she will be studied) is the best moralist; and hath much good counsel hidden in her bosome.

Reliquiae Wottonianæ. *Of Education*, ch. i.

That which is said of the elephant, that being guiltie of his deformitie, he cannot abide to looke on his owne face in the water, (but seekes for troubled and muddy channels,) we see well moralized in men of evill conscience, who know their soules are so filthy, that they dare not so much as view them.

Hall. *Works*, vol. i. fol. 13. *Meditations and Vowes*, Cent. 2. sec. 4.

A book of moralizations upon Ovid's Metamorphoses.

Baker. *Henry V.* Anno 1422.

The wiser and more morale part of mankind were forced to set up laws and punishments, to keep the generallity of mankind in some tolerable order.

Hale. *Origination of Mankind*, ch. vii. sec. 5. fol. 355.

And he that shall collect all the moral rules of the philosophers, and compare them with those contained in the New Testament, will find them to come short of the morality delivered by our Saviour, and taught by his Apostles; a college made up for the most part of ignorant but inspired fishermen.

Locke. *Works*, vol. ii. fol. 353. *The Reasonableness of Christianity*, &c.

I am bold to think, that morality is capable of demonstration, as well as mathematicks; since the precise real essence of the things moral words stand for, may be perfectly known; and so the congruity or incongruity of the things themselves be certainly discovered; in which consists perfect knowledge.

Id. *On Human Understanding*, book iii. ch. xi. sec. 16.

She sigh'd; she smil'd: and, to the flowers

Pointing, the lovely moralist said:

See, friend, in some few fleeting hours,

See yonder, what a change is made.

Prior. *The Garland*.

A moral agent is a being that is capable of those actions that have a moral quality, and which can properly be denominated good or evil in a moral sense, virtuous or vicious, commendable or faulty.

Edwards. *On the Freedom of the Will*, part i. sec. 5. p. 41.

Moral philosophy, morality, ethics, casuistry, natural law, mean all the same thing, namely, that science which teaches men their duty and the reasons of it.

Paley. *Moral Philosophy*, book i. ch. i. p. 1.

[The love of God] is one of those many peculiar circumstances which so eminently distinguish the doctrines of the Gospel from the dry unanimated precepts of the ancient heathen moralists.

Porteus. *Sermon* 1. vol. i. p. i.

Morality is the rule which teaches us to live soberly and honestly. It hath four chief virtues, which moral writers have well explained; justice, prudence, temperance, and fortitude.

Horne. *Works*, vol. vi. p. 541. *Charge to the Clergy of Norwich*.

Political reason is a computing principle; adding, subtracting, multiplying, and dividing, morally, and not metaphysically or mathematically, true moral demonstrations.

Burke. *Works*, vol. v. p. 126. *Reflections on the Revolution in France*.

MORASS seems to be merely a different way of writing *marish*, or *marsh*.

The false morass

In quivering undulations yields beneath

Thy burthen, in the miry gulf enclos'd!

Shenstone. *Moral Pieces*, part iii.

The sides and top are covered with morassy earth.

Pennant.

MORATION, Lat. *moratio*, from *morari*, to delay, to retard.

Delay.

For therein [the Northern hemisphere, and in the apogee] his *moration* is slower, and so his heat respectively unto those habitations as of duration, so also of more effect.

Sir Thomas Brown. *Vulgar Errors*, book vi. ch. x.

MORAVIA (in German, MAHREN) forms, with part of Silesia, a Province of the Austrian Empire. It is 210 British miles in length from East to West, 120 from North to South, and contains 11,571 square British miles in superficial extent. It is bounded on the North-West by Bohemia, North-East by Prussia, East by Galicia, South-East by Hungary, South-West by the Austrian Province styled "Below the Ens."

The surface of the Country is high and uneven in the Northern part, which is separated from Bohemia by the range called the Sudeten, from Silesia by the Gesenke, and from Galicia and Hungary by the Carpathian Mountains. From the declivity of those heights the land slopes to the South, and much the greater part of the water of Moravia passes off through the channel of the Morawa, as its principal river is called by the Sclavonians, whilst the Germans give it the name of March. This main stream receives from the East the Betschwa, from the West the Hanna, the Dige, and the Igla, and falls into the Danube: neither itself nor the tributary streams are navigable excepting for boats of very small draught. A few streamlets descend to the Elba from the Western extremity of Moravia, and the Oder as well as the Vistula rise in the Northern part. As this region sends streams to the German Ocean, the Baltic, and the Black Sea, it must necessarily lie high, and accordingly we find that the elevation of the surface varies at a mean estimate from 500 to 900 feet. The summits of the main range of mountains are of granite, the lower parts of gneiss and schistose mica; in the part adjoining Bohemia there are extensive beds of coal, and throughout the hilly region limestone occurs containing iron, lead, or zinc. There are unequivocal traces of volcanic action in the soil of Moravia. The hill, called Raudenburg, to the North of Olmütz, reaches an elevation of 2250 feet above the level of the sea, and is composed of reddish, greyish, or blackish scoriæ, which look as fresh as those of Vesuvius: it also contains basalt. These products enclose fragments of granitic rocks and of mica, or clay-slate, which are much altered, and seem to pass into the scoriform mass which envelopes them. To the South-East of this hill, near Heydenpilsch, are two hillocks of compact basalt; and more to the South, near Brochersdorf, is a basaltic hill, called the Saunikal, and on the right of the Mora are two others. To the North-East are two funnel-shaped cavities, of which the largest is seventy-five feet in breadth and eighteen in depth. These basalts rise from the midst of mica-slate, are compact, and sometimes columnar, and contain olivine. On the Western border also of Moravia, near Hungary, is a small basaltic deposit close to Banow: it has the form of a cone of grey clinkstone, containing crystals of hornblende, and the few pores which are distributed through its substance are elongated in a vertical

MORASS.

MORA-VIA.

MORA-
VIA.

Climate.

direction. On its Western side it encloses portions of hardened clay, and on its Eastern side it has thrown up and cracked in various directions a very large mass of the same kinds of rock, which are also hardened, where in contact with it. The loftiest summits are the Snowy Mountain, attaining an elevation of 4314 feet; in the Circle of Olmütz, and in the Circle of Troppaw, the Bischof's Cappe 3000, the Alt Vater 4200 feet high. The climate of Moravia is milder than might be expected from the elevation of the surface and the latitude. The thermometer sometimes during Summer stands at the height of 82° in the shade; the Winters, however, are occasionally so severe that the mercury has fallen to 7° below zero; the mean temperature at Olmütz is 45° 4'. In Austrian Silesia, lying to the North of the Sudeten, the climate is much colder, and the crops and fruits reach maturity six weeks, or in some instances even two months later than throughout the rest of the Province. The North-West is the prevailing wind; the air is generally pure and healthful. At Olmütz the average annual fall of rain is twenty-five inches. Even in the mountainous parts, numerous valleys and plains of small extent afford the cultivator a fertile field for his labour, and the more level tracts, constituting perhaps two-thirds of the territory, yield to few Countries in fertility.

Agriculture
and manu-
factures.

Hassel computes that the Province contains, of *joches** in arable land 2,071,474, gardens 57,928, vineyards 50,856, meadows 324,805, pastures 428,828, fishponds 41,811, woods 1,120,235. The same authority gives the following particulars concerning the amount of agricultural products in one year; in oats 13,936,728 *metzen*,† rye 7,112,437, barley 3,156,228, wheat 2,371,651. Flax and hemp of excellent quality are extensively cultivated. All fruits suitable to the middle tract of the temperate climate succeed well. The vine thrives even so high as the forty-ninth degree of latitude, and the annual average amount of the vintage is stated at 436,660 *eimer*.‡ The hay crop amounts to 5,000,000 cwts. annually. In 1817, the farming stock consisted of horses 127,845, black cattle 357,238, sheep 402,642, besides a great number of swine and poultry. The woods, in addition to timber for building and fuel, supply potash and nut-galls. Bees are an important object to the farmer, and as the climate and products of the Country well suit their nature, the number of hives is very great. The breeding and feeding of fish by artificial means is here probably carried to a greater extent than in any other Country; and the produce of this sort of husbandry forms a very important article in the diet of the inhabitants. The land is for the most part in the hands of a few great proprietors; of these the principal is Prince Lichtenstein, whose estate is computed to be worth above ten millions of florins. The peasantry, more fortunate than the great majority of the Slavonian race, are free both in their properties and persons. The principal manufacture is that of flaxen and hempen cloth, which employs 200,000 spinners, 15,000 weavers, and amounts on an average to 13,500,000 yards annually. The woollen manufacture is very flourishing, employing 100,000 persons, and producing 20,000 pieces of broadcloth, the same quantity of kerseymere, and 110,000 pieces of the coarser kinds. About 10,000 persons are employed on the cotton manufacture. The manufacture of paper and the preparation of leather are also in a

flourishing state. Mines of gold and silver were formerly worked, but since the precious metals of America have more abundantly supplied the Old World, this mode of employing capital and labour has been laid aside. If we except coal and a small quantity of alum, the mining operations are confined to iron, of which about 40,000 cwts. are annually reduced from the ore. From these particulars it may easily be collected that Moravia forms, in proportion to its extent, the richest and most productive of the Provinces of Austria.

The population, amounting to 1,733,319 persons, is divided into Slavonians, in number 1,250,000, Germans 450,000, Jews 28,000, besides a few French settlers, and about 1000 Gypsies. This statement compared with the extent assigns 149 persons to each British square mile. There are 119 assemblages of dwellings sufficiently large to be called towns, 118 smaller, in which, however, markets are held, 3672 villages, and 281,395 houses. The Slavonians dwell principally in the level and more fertile part of the Country, and are a respectable race, estimable both in their public and private relations; brave, honest, and attentive to domestic order and cleanliness. Their Language is a branch of the great Slavonian stock, and bears the character of being rich, harmonious, and flexible to all the varieties of musical intonation. The earliest period at which it can be ascertained to have been written is 990, about which time Adalbert, a Bishop, composed a Hymn still extant. There are two newspapers and four literary journals published in this dialect. The great majority of the inhabitants profess the Roman Catholic Faith, which is established by law, though perfect toleration is allowed to all sects in consequence of the edict promulgated, 1781, by Joseph II. to that effect; and this indulgence is claimed by 68,000 Protestants, of whom the greater proportion, relatively to the actual population, is found in Silesia. The doctrines of the Waldenses and Hussites were early propagated in Moravia, and those who held them possessed at the time of the Reformation above 200 churches, under the name of *Herrnhuter* or *Unitas Fratrum*. They experienced rigorous persecution on account of their refusal to bear arms against the Schmalcaldic League, on which occasion numbers emigrated to Poland and Prussia. The nonconformists in Moravia suffered dreadfully from the desolation of the Thirty Years' War, but by patience and caution they contrived to escape extermination, and to remain faithful to the dictates of their consciences. In 1722 there was an extensive emigration of the Moravian Brotherhood, when imbuing Count Zinzendorf with their doctrines, their Society assumed a more stable and influential form. The Ecclesiastical dignitaries in Moravia are the Archbishop of Olmütz and the Bishop of Brünn, having under their jurisdiction 561 parishes. Education is not neglected, as there are 3229 public schools, frequented by 153,000 pupils of both sexes.

The Province is divided into eight Circles:

	Population.	Chief Town.	Populat.	Latitude.	Long. E.
Olmütz	350,266	Olmütz	11,000	49° 32' 43"	17° 15'
Brünn	305,175	Brünn	25,764	49° 11' 32"	16° 40'
Iglau	146,179	Iglau	10,986	49° 23' 25"	15° 23'
Znaym	137,392	Znaym	5,106	48° 51' 15"	16° 0'
Hradisch	215,939	Hradisch	1,413	49° 3' 0'	
Prerau	221,720	Prerau	3,183		
Troppau	195,036	Troppau	9,748	49° 50' 1"	18° 0'
Teschen	153,307	Teschen	5,379	49° 41' 0"	18° 40'

The government is delegated by the Emperor to a Governor, assisted by a Council, consisting of the Chief

MORA-
VIA.

Chamberlain of the Province, the Chief Judge, Chief Register, Under Chamberlain, and two Deputies out of each of the four Estates. These Estates are, 1st, the Prelates; 2dly, Nobles; 3dly, the Knights possessing a certain hereditary qualification in land; 4thly, the Burghers. These meet once a year at Brünn, for advising rather than controlling the Governor, or originating any measure of their own. Moravia supplies to the armies of the Austrian Empire in troops, a corps of sappers, two battalions of yagers, five regiments of infantry, two of cuirassiers, two of dragoons, and three of artillery; and to the exchequer 7,200,000 florins.

Brünn.

The Capital is *Brünn*, a town surrounded by a wall, but incapable of defence against a regular and vigorous attack. It contains a Cathedral, six parish Churches, three Convents, three Hospitals, and 1766 private houses. The building devoted to the purposes of the Provincial Government is large, and in a fine style of architecture; in it is preserved the plough held by Joseph II., when, in imitation of the Chinese Emperors, by sharing in the labours of agriculture, he wished to express the esteem in which he held them. This town is the principal mart and seat of manufactures in the Province. Every year four Fairs are held in it, each for the space of fourteen days, during which great numbers attend from all parts of Germany and Poland.

Olmütz.

Olmütz (in Moravian *Holomauz*, in Latin *Eburum*) was formerly the seat of the Provincial Government, at present established at Brünn. It lies on the banks of the river March, the waters of which, admitted into the ditches of the fortification, contribute to its security. The part at present called the Suburb, is considered the most ancient division of the town, having, according to the local antiquaries, been founded by the Roman Emperor Maximin in the IIIrd century. *Olmütz* is the See of an Archbishop, whose jurisdiction extends over all Moravia. He is chosen by the Chapter, which is a very wealthy as well as influential Body. In addition to the Cathedral there are six churches, among which that of St. Maurice is remarkable for its noble organ of 2332 pipes, and for a bell weighing 15,000 pounds. There is an Hospital, an Arsenal, and a Lyceum or College, with a good Library conducted by 24 Professors, having 764 students under their care. The Mongols having ravaged Poland and Russia in 1241, penetrated as far as *Olmütz*; but the Governor Jaroslaus having in a nocturnal sally with his own hand killed Peta, the Chief of those Barbarians, and thinned their numbers by the carnage which he spread amongst them, they drew off to the Eastward. The town was taken by Torstensohn in 1642, and remained in the possession of the Swedes until restored to Austria at the Peace of Westphalia. It fell into the hands of the Prussians in 1741, but after a year's occupation was evacuated. In 1758, Frederick the Great in person opened the trenches against it, but after remaining before it for six weeks, he raised the siege in consequence of his supplies having been intercepted. At Ullersdorf, a few miles to the North of the town, is a tepid spring of mineralized water long celebrated for its medicinal efficacy.

Brod Hun-
garisch.

Brod Hungarisch is remarkable for the many severe attacks which it has survived. In 1605, Botsky Prince of Transylvania, at the head of 12,000 men, attempted to take it by storm, but was repulsed by the citizens, who had called some companies of Cossacks to their assistance, and pursuing their advantage gave battle to the assailant with so great success that he was obliged preci-

pitately to fly into Hungary. The celebrated Bethlehem Gabor having, in 1622, united his forces with those of George Markgrave of Brandeburgh, brought an army of 70,000 men against the town, which he besieged for several months, until a general pacification obliged him to draw off his troops. The besieged had suffered dreadfully from famine, and although they scrupled not to devour every substance which, however loathsome, might enable them to sustain life, numbers perished by hunger, and a still greater number died of an infectious disease the result of their privations. In 1643 *Brod Hungarisch* was plundered by the Swedish troops under Anderson, and after 400 waggons had been conveyed away laden with the effects of the inhabitants, the town was fired in several places and almost totally reduced to ashes. The loss on this occasion was estimated at above £100,000. In 1663, during the Turkish war, a large body of Tartar horse made an irruption as far as this town, but the bravery of the residents having repulsed their attack, they mercilessly ravaged the surrounding country, and led away above 10,000 persons into slavery.

Hradisch, situated on an island in the March, is a well-built and fortified town, but subject to be overflowed by the inundations of the river.

Iglau, seated on the river of the same name, is a thriving place, having an active trade in beer and cloths. There are in it above 100 breweries, and 300 manufactories for woollen cloths, of which above 40,000 pieces are annually produced and despatched to the markets of Hungary and Turkey. A considerable capital is vested in the machinery of these factories, as well as in that employed in making paper, which is here produced of a quality not inferior to that of Holland. An income of £150,000 is computed to be annually drawn by the inhabitants from these sources. It is mentioned in the ancient records of this town, that in June, 1122, a heavy snow fell, and the cold was so severe as to cause the rivers to freeze. It is also gravely recorded that, in 1139, a certain John, a citizen of this place, died aged 361, having above three centuries before been armour-bearer to Charlemagne.

Kremsier is a handsome town, with a Castle, the usual residence of the Archbishop of *Olmütz*; and containing a Gallery of Pictures, a Library of 30,000 volumes, and a Mineralogical Museum. Population 3887.

Meseritz, situated on the banks of the Ozlawa, is celebrated for the size and beauty of the topazes found in its vicinity. Its origin is of very remote date, being referred by the local antiquaries to Maraboduus, whose reign is recorded in Tacitus. Population 3043.

Muschau, a small town seated at the confluence of the Zaya and Iglau, marks the field of a battle between the Romans and Marcomanni. A great number of the coins of the Roman Emperors and other relics, proving the presence of their armies in this neighbourhood, have been from time to time dug up near the town. It had been formerly a part of the extensive domains possessed by the Templars in Moravia.

Nikolsburg, a fortified town with suburbs, and a district inhabited by above 3000 Jews, lies to the South of Brünn in a pleasant valley formed by two mountains. It contains a magnificent Castle belonging to Prince Dietrichstein, the proprietor as well of the town as of the neighbouring country. The Library of the Castle contains 20,000 volumes, many of them rare, and several valuable manuscripts. In the cellar is a huge wine

MORA-VIA. vessel holding 40,000 gallons. The vicinity abounds with vineyards producing wine of excellent quality. The neighbouring mountains contain quarries of marble, and in some places exhibit vast deposits of petrified sea-shells and of fossil bones of a great size. Population 7022.

Wellehrad. *Wellehrad*, at present a Convent of the Cistercian Order, was the Capital of the Kingdom of Moravia, when during the VIIIth and two succeeding centuries it extended over Bohemia and part of Poland and Hungary. Its name, originally *Welliki Gorod*, or the Great Town, expressed its size and importance, which must have been considerable, as the ruins of the ramparts which may still be traced enclose a space of several miles in circuit. In 947, it was burned by the Hungarians, and subsequently also in 960, since which time it has continued in its present insignificance.

Znaym. *Znaym* is situated on a hill, having at one side a gradual acclivity, at the other a precipitous fall. It is, after Brünn and Olmütz, the most important place in Moravia, but possesses no peculiar features which demand specific notice.

Historical outline. The earliest information which remains to us concerning Moravia is derived from the Roman Historians. They represent it as inhabited by the *Quadi* and *Marcomanni*, who, always troublesome to the Roman Empire, threatened it with destruction in the reign of Marcus Aurelius, when it was found necessary to direct against them all the force, skill, and discipline of the Imperial armies. On the emigration of the primitive inhabitants during the universal movement of the German population in the early centuries of the Christian Era, the land was occupied by a colony of Slavonians who founded the Kingdom of Great Moravia. Charlemagne conquered their King Swiatoslaf, and constrained him to submit to Baptism, although Christianity was not voluntarily and sincerely professed until 856, when preached by Cyril. In the XIth century the Kingdom of Moravia became so weak that it was partitioned between Poland, Hungary, and Austria. Subsequently, the Dukes of Bohemia succeeded in obtaining possession of the greatest part of it, and retained their prize until wrested from them by Mathias Corvinus, King of Hungary. On his death, however, in 1490, it reverted to Bohemia, and together with that Kingdom it was transferred, in 1526, to the dominion of the House of Austria. The Circles of Troppau and Teschen are the relics of the Austrian territory in Silesia, having, in 1742, been exempted from the general cession of that Duchy to Prussia.

Seignior Malpighi, in his Treatise of Galls, under which name he comprehends all preternatural and morbose tumors and excrescencies of plants.

Ray. *Of the Creation*, part i.

For as the inference is fair, affirmatively deduced from the action to the organ, that they have eyes, because they see; so it is also from the organ to the action, that they have eyes, therefore some sight designed; if we take the intention of nature in every species, and except the casual impediments, or *morbosities* in individuals.

Sir Thomas Brown. *Vulgar Errours*, book iii. ch. xviii. p. 188.

The first was with base dunghill rags yclad,
 Tainting the gale, in which they flutter'd light;
 Of morbid hue his features, sunk and sad;
 His hollow eyne shook forth a sickly light.

Thomson. *The Castle of Indolence*.

I should be most gladly satisfied about this remedy, whether or no it do indeed, either proscribe the *morbific* matter, or so alter its texture as to make it harmless.

Boyle. *Works*, vol. ii. p. 90. *The Usefulness of Natural Philosophy*, part ii. ess. 3.

Whilst the distempers of a relaxed fibre prognosticate and prepare all the *morbid* force of convulsion in the body of the state, the steadiness of the physician is overpowered by the very aspect of the disease.

Burke. *Works*, vol. viii. p. 95. *On a Regicide Peace*.

MORDA'CIOUS, Fr. *mordacité*; It. *mordace*,
MORDA'CITY, *mordacità*; Sp. *mordace*, *mordaz*, *mordazidad*; Lat. *mordax*,
MO'RDICANT, from *mord-ere*, to bite, which
MO'RDICANCY, Cæsar Scaliger composes of the
MORDICA'TION, Gr. *μῶρον ἐδεν*, *partem edere*,
MO'RDANT. and Martinius of *μείρειν ἐδωκεν*, *edens dividere*.

Biting, nipping, or pinching sharply, keenly. Chaucer uses *mordant*, (Fr. *mordant*, biting,) for the tongue of a buckle.

The mourdant wrought in noble gise,
 Was of a stone ful precious.

Chaucer. *The Romant of the Rose*.

Such things as have very thin parts, yet notwithstanding are without all acrimony, or *mordacity*, are very good sallets.

Bacon. *The History of Life and Death*, sec. 25. p. 41.

It [salt] in physick is held for *mordant*, burning, caustike, and mundificative.

Holland. *Plinie*, book xxx. ch. x.

Wise phisicians should with all diligence inquire, what simples nature yieldeth, that have extream subtile parts, without any *mordication* or acrimony.

Bacon. *Natural History*, Cent. vii. sec. 692.

Many of these [composts] are not only sensibly hot, but *mordacious* and burning.

Evelyn. *Earth*.

The young seedling leaves and roots, raised on the monthly hot-bed, almost the whole year round, affording a very grateful *mordacity*, and sufficiently attemper the cooler ingredients.

Id. *Miscellaneous Writings*, p. 751. *Acetaria*, (51.)

The *mordicant* and pungent, and such as repress or discuss flatulency, revive the spirits, and aid concoction, with such as abate and take off the keenness, mollifie and reconcile the more harsh and churlish.

Id. *Ib.* p. 762.

The *mordicancy* thus allay'd be sure to make the mortar very clean, after having beaten Indian capsicum, before you stamp any thing in it else.

Id. *Ib.* p. 750. (47.)

MORDELLA, in *Zoology*, a genus of *Coleopterous* insects.

Generic character. *Antennæ* rather short, slightly serrated in the males; maxillary *palpi* terminated by a securiform joint; head heart-shaped, abruptly strangulated at its junction with the thorax, which is semicircular; body elevated, arched, with the abdomen terminating in a long, sharp joint; *elytra* short and narrow, ending in an acute point; *scutellum* distinct; hinder legs large; all furnished with simple *tarsi*; the latter heteromerous.

Type of the genus, *M. aculeata*, Linnæus; Olivier, *Ent.* vol. iii. pl. i. fig. 1. a—c. About twenty species, found on flowers, &c. in various parts of Europe; eight of them in Britain.

MORE.

MORE, *adj.* } A. S. *mæ, mare*; Ger. *mer*; D. *meer*; Sw. *mer*. Skinner suggests
 MORE, *adv.* } the Lat. *major*. Tooke accounts for
 MORE, *v.* } *more, most*, thus,—*Mow*, or *mowe*, is
 Mo'RENESS, } the pret. and past participle of A. S.
 Mo'REOVER. } *maw-an, melere*, (in D. *maeyen*, Ger. *mähen*, Sw. *mäja*), and means simply that which is *mowed* or *mown*; and as the hay, &c. which was *mown* was put together in a heap, hence, figuratively, *mowe* was used in A. S. to denote any heap, and was pronounced (and therefore written) with some variety, *ma, mæ, mo, mowe, mow*, which being regularly compared, give,
 Ma, *ma-er*, (*i. e.* A. S. *mare*), *maest*, (*i. e.* *mæst*.)
 Mæ, *mæ-er*, (*i. e.* *mære*), *mæ-est*, (*i. e.* *mæst*.)
 Mowe, *mower*, (*i. e.* *more*), *mow-est*, (*i. e.* *most*.)
 Mo, *mo-er*, (*i. e.* *more*), *mo-est*, (*i. e.* *most*.)
Mo, (*mowe, acervus*, heap,) which was constantly used by all our old English authors, has with the Moderns given place to *much*; which is merely the diminutive of *mo*, passing through the gradual changes of *mokel, mykel, mochel, muchel*, (still retained in Scotland,) *moche, much*.

Dr. Jamieson asserts that this hypothesis labours under several considerable difficulties. One alone deserves notice, *viz.* that the A. S. *ma*, is as really a comparative as *mare*, both being used adverbially in the sense of *plus, magis*; to which it may be answered, that *mare*, or *maer*, is Grammatically a comparative formed by the addition of the termination *er* to *ma*; but that *ma* itself is not a comparative by any Grammatical formation, and that the simple circumstance of its being used in the sense of *plus, magis*, will not constitute it Etymologically a comparative. *Less* is not so, our elder writers following analogy, added the termination *er*, and wrote *lesser*: the meaning of *less* will account for its usage, as applied to something small-er than, or not so large as, something else, and the meaning of *ma* or *mo* will account for its usage, both as applied to something large (positively) and to something larg-er (comparatively) than something else. Let that which is *mow-en* be heaped, accumulated, raised, as is usual, into small heaps or stacks, each stack will be a *mow*, or quantity *mown*; put several together, the accumulation is still a *mow*; put all in one, the whole coacervation is still a *mow* or stack, containing the quantity *mown*; and the reason of the application of the word to increase or enlargement appears evident from this practice of increasing or enlarging the heaps by repeated coacervations, till the whole were raised into one heap: *mo*, or *ma*, became thus, by consequence, a comparative term: its positive meaning remained unaltered: the addition of the termination *er* constituted the Grammatical comparative, which has obtained exclusive use. The progress with *less, lesser*, has been different. *More, adj.*

Greater, larger; added. *More, n.*

A greater, a larger, (*sc.* number, quantity, in tale, in measurement, sometimes with a subaudition of other nouns, *sc.* time or times, thing or things.)

þe fyfte tyme won Engelond þo folc of Normandie,
 þat a mong vs wonþ zet, and schulleþ euer *mo*.

For fals semblant hath ever *mo*
 Of his counsaile in companie
 The derke vntrewe hypocrisie,
 Whose worde discordeth to his thought.

Id. Ib. book ii. p. 59.

What he will make lesse, he lesseth,
 What he will make *more* he *moreth*.

Id. Ib. book vii. p. 218.

But friendly Faeries, met with many Graces,
 And lightfoote Nymphes, can chace the lingring night
 With heydeguyes, and trimly trodden traces,
 Whilst Sisters nine, which dwell on Parnasse hight,
 Doe make them musick for their *more* delight.

Spenser. Shepherd's Calendar. June.

CONST. O take his mother's thanks, a widdow's thanks,
 Till your strong hand shall helpe to giue him strength,
 To make a *more* requitall to your loue.

Shakspeare. King John, fol. 3.

Now when the lords and barons of the realme
 Perceiu'd Northumberland did leane to him,
 The *more* and lesse came in with cap and knee.

Id. Henry IV. First Part, fol. 68.

Of Faery lond yet if he *more* inquirye,
 By certein signs, here sett in sondrie place,
 He may it fynd.

Spenser. Faerie Queene, book ii. can. 1.

MORE, *n.* } Grose says, that *more*, or *maur*, in
 MORE, *v.* } Gloucestershire signifies a root; as a straw-
 berry *more*; and *moreing-axe*, an axe for grubbing up the

MORE.

MORE. roots of trees. Probably from A. S. verb *myrran*, to spread. See MORROW, MORN. Applied to
MO-RINDA. The root; because it *spreads*; and the verb will be formed upon the noun;

To root or root up; get up the root.

The erchebissop's wodes ek the king het ech on,
 That me *morede* echone vp, that then ne beleuede non,
 That ech tre were vp *mored* that it ne spronge namore there.
R. Gloucester, p. 499.

A man ypassid yowith, and is wythout lore,
 May be wele likyned to a tre without *more*,
 That may nat bowe ne bere fruyte, but root [*i. e. rot*] and even wast.
The Marchantes Second Tale. Imputed to Chaucer.

Tenne thousand *mores* of sundry sent and hue
 That might delight the smell, or please the view,
 The which the nymphes from all the brooks thereby
 Had gathered, they at her foot-stoole threw.

Spenser. Faerie Queene, can. 7. Of Mutabilitie.

MORENIA, in *Botany*, a genus of the class *Dioecia*, order *Hexandria*, natural order *Palmæ*. Generic character: spathe four-leaved: male flower, calyx triangular, flat; corolla, petals two; the rudiment of a germen: female flower, germen three-cleft; drupes three, one-seeded.

One species, *M. fragrans*, a palm, native of the woods in Peru.

MORETTIA, in *Botany*, a genus of the class *Tetradynamia*, order *Siliculosa*, natural order *Cruciferae*. Generic character: segments of the calyx erect, linear; petals linear, entire; pod oblong, compressed; style short, conical; cotyledones accumbent.

One species, *M. philæna*, native of Nubia. Decandolle.

MORGANIA, in *Botany*, a genus of the class *Didynamia*, order *Angiospermia*, natural order *Labiatae*. Generic character: calyx five-parted, equal; corolla, superior lip two-lobed, inferior three-cleft, lobes nearly equal, obcordate; stamens enclosed; stigma two-lipped; capsule two-celled, two-valved, valves two-parted.

Two species, natives of New South Wales.

MORICANDIA, in *Botany*, a genus of the class *Tetradynamia*, order *Siliquosa*, natural order *Cruciferae*. Generic character: calyx closed, the base bisaccate; petals unguiculate, border obovate, spreading, entire; pouch compressed, sometimes quadrangular; seeds ovate, small; cotyledones conduplicate.

A genus allied to *Brassica*, containing three species, natives of the South of Europe. Decandolle.

MORIGERATION, It. *morigerare*, *morigerazione*; Sp. *morigerar*, *morigeration*; Lat. *morigerari*, (*morem gerere*,) to comply.

Compliance, acquiescence, conformity.

Not that I can tax or condemn the *morigeration* or application of learned men to men of fortune.
Bacon. Works, vol. i. p. 12. Of the Advancement of Learning, book i.

MORINA, in *Botany*, a genus of the class *Diandria*, order *Monogynia*, natural order *Dipsaceae*. Generic character: calyx a one-leaved fruit, toothed; corolla unequal; one seed under the flower cap.

One species, *M. Persica*, native of Persia.

MORINDA, in *Botany*, a genus of the class *Pentandria*, order *Monogynia*, natural order *Rubiaceae*. Generic character: flowers collected in a globular form on the spherical receptacle; calyx five-toothed; corolla funnel shaped, five-cleft, spreading; berries aggregate, angular, from mutual compression, two-seeded.

Four species, natives of the West Indies and South Sea Islands.

MORINGA, in *Botany*, a genus of the class *Decandria*, order *Monogynia*, natural order *Leguminosae*. Generic character: calyx five-leaved, oblong, deciduous; corolla, petals five, somewhat unequal, the superior petal ascending, sometimes five of the stamens are sterile; pod three-valved.

Four species, natives of Africa and China.

MORION, or } Fr. *morion*; It. *morione*; Sp. *MU'RRION*. } *morion*. Bochart, says Menage, from *Maurus*; a *Maurorum usu*, because used by the *Moors*. It is more probably from the A. S. *myrr-an*, to dispel, to repel, *sc.* a blow at the head; and hence applied to

Armour (for the head,) a burganet.

And see **HELMET**.

Then to herselfe she gives her Ægide shield,
 And steel-hed speare, and *morion* on her hedd,
 Such as she oft is seene in warlike field.

Spenser. Muirpotmos.

Philopoemen reformed all this, perswading them to use the pike and shield instead of the little target, spear, or bore-staff, and to put good *morians*, or burganets, on their heads.

Sir Thomas North. Plutarch, fol. 309. Philopæmen.

And when thy noble body is in durance,
 Thus do we clap our musty *murrions* on,
 And trace the streets in terrour.

Beaumont and Fletcher. Philaster, act iv. sc. 1.

Their beef they often in their *murrions* stew'd.

King. Art of Cookery.

MORISSONIA, in *Botany*, a genus of the class *Monadelphia*, order *Polyandria*. Generic character: calyx simple, two-cleft; corolla, petals four; one pistil; berry coated with hard bark, one-celled, many seeded.

One species, *M. Americana*, a tree, native of the West Indies.

MORKIN, perhaps *mor*, *i. e.* having the *murre*, or *murrain*, *q. v.* and *kin*, the diminutive.

Could he not sacrifice
 Some sorry *morkin* that unbidden dies,
 Or meager heifer, or some rotten ewe.

Hall. Satire 4. book iii.

MORMAL, Low Lat. *malum-mortuum*; Fr. *maux-mortz*, is a kind of disease in the feet and shins. And Mr. Tyrwhitt thinks that Chaucer meant by *mormal*
 A cancer or gangrene.

But gret harm was it, as it thought me
 That on his shinne a *mormal* hadde he.

Chaucer. Prologue to the Canterbury Tales, v. 388.

Bothe himself and all hys secte, were fayne to seeke some plasters of false gloses, to heale the foule *marmole* of theyr scabbed shynnes.
Sir Thomas More. Workes, fol. 1088. Aunsuere to the Poysoned Boke, &c.

And thus good readers you see, that wher as his *marmole* is more the an hād full brode: this plaster of his passeth not the bredth of a peny.

Id. Ib. fol. 1089.

They hold it [*sesama*] excellant to heale the old cancerous and maligne ulsers, named *cacoëthe*, *i. morimals*.

Holland. Plinie, vol. ii. book xx.

And the old *mor-mal* on his shin,
 Now prick and itch, withouten blin.

Ben Jonson. Sad Shepherd, act ii. sc. 2.

MORMO, Gr. *μορμῶ*, *pro larva et terriculum accipitur*, a sort of goblin or spectre.

But to have been sick of the fright, to have lavished our constancy, courage, conscience and all, in Indian sacrifice to a sprite or *mormo*, *ne noccat*, to escape not a real evil, but only an apprehension or terror, this is a piece of the most destructive weariness, the *ἀσέβης ἀκρίβεια*, the greatest simplicity that can be.

Hammond. Works, vol. iv. fol. 577. Sermon 3.

MO-
RINGA.
—
MORMO

MORMO. **MORMO**, in *Zoology*, a genus of *Lepidopterous* insects.

MORN.

Generic character. *Palpi* rather short, densely clothed with scales, hair-like on the basal joint, the terminal joint conspicuous, ovate-conic, acute; the basal joint about half the length of the second, rather curved; the second elongate, slender, slightly attenuated to the apex, which is somewhat acute; *maxillæ* shorter than the *antennæ*; *antennæ* moderate, simple, slightly pubescent beneath in the males; head smooth, densely squamous between the *antennæ*; eyes naked; *stemmata* distinct; *thorax* rather short, densely pilose, crested; *abdomen* rather stout, crested on the back, with a small tuft at the apex; wings deflexed, and forming a triangle during repose; anterior subtriangular, broad, the hinder margin crenate; posterior large, ovate-triangular, crenate on the hinder margin; legs rather short and stout. *Larva* naked, with a small head, the sides ciliated, the body tapering towards the tail, the caudal segment tuberculated; *pupa* with two spines at the end; folliculated.

Type of the genus, *P. Maura*, Linnæus; Donovan, *Brit. Ins.* plate xxx. fig. 1. One species only, a native of Europe and of Britain.

MORMYRUS, from the Greek *μόρμυρος*. In *Zoology*, a genus of animals belonging to the family *Esocides*, order *Malacopterygii Abdominales*, class *Pisces*.

Generic character. Body scaly, oblong, compressed, tapering towards the tail, becoming thicker towards the caudal fin; head covered with a thick, naked skin, which envelopes the gill-flap, and leaves but a vertical cleft for the branchial aperture; the muzzle elongated, and the opening of the mouth very narrow; teeth slender, and indented at their tips on the intermaxillaries and lower jaw, and in long rows on the tongue and palate; dorsal fin single.

The remarkable characters in this genus are the elongation of the muzzle, which has some resemblance to the snout of the Ant-eaters; the extensive envelopment of the gill-cover, so that the branchial opening is merely a cleft, which has induced some authors to deny the existence of any gill-cover; and the increased size of the tail, which, instead of being compressed like the body, is nearly cylindrical. They are all found in the Nile.

Some have the mouth cylindrical, and the dorsal fin long; such are

M. Hasselquist.

M. Caschive.

M. Oxyrinus.

M. Cannume.

Others have the snout cylindrical, and the dorsal fin short; as

M. Anguilloides, Geoffr.: and Geoffroy thinks that in one of these divisions the *Oxyrinque*, formerly adored by the Egyptians, is to be met with.

Some have the muzzle short and rounded, and the dorsal fin short; as

M. Labiatus, Geoff.

M. Dorsalis, Geoff.

Whilst others have the forehead prominent, with a receding mouth; as

M. Cyprinoides, Geoff.

See Lapepe, *Histoire des Poissons*; Cuvier, *Règne Animal*.

MORN. } The elder Etymologists have nothing
Mo'RNING. } to say respecting these words; Tooke's
Mo'RROR. } researches are most happy. *Morrow*,

morn, and *morning* were in old English written *morew*, *morewn*, *morewende*; in A. S. *merien*, *mergen*, *merne*; *margen*, *marne*, or *morgen*, *morn*; and he believes them to be the past tense and past participle of the Goth. and A. S. verb *merjan*, *merran*, *mirran*, *myrran*, to dissipate, to disperse, to spread abroad, to scatter; *morr*, the regular past tense of this verb, pronounced and written *morwe*, *morew*, and subsequently *morowe*, *morow*, by adding the participial termination *en*, *merg-en*, *merien*, *mer'n*; *marg-en* *mar'n*, *morg-en*, *morn*; or *morewen*, *morew'n*, *mor'n*. *Morrow* and *morn* then have the same meaning, viz. dissipated, dispersed, sub. clouds or darkness, whose dispersion, or the time when they are dispersed, these words express. *Morning*, the present participle *myrrende*, in old English *morewende*, (*ende*, as usual, converted into *ing*.) as in Chaucer *morwening*; thence *morewing*, *morwing*, *morning*.

Morning is, by usage, applied to a considerable portion of the day succeeding the dispersion of darkness; and *morrow*, *to-morrow*, to the whole day next following *to-day*.

Aureli & Uter, þe twei breþren corteys,
With gret power a *morwe* ariuede at Totteneis.

R. Gloucester, p. 134.

þe Tiwesday to Euesham he wende þe *morweninge*.

Id. p. 558.

Com þe kȳnge's sonnes tuo.

Id. p. 17.

Ac on a Maȳ *morweninge* on Malverne hulle

Me bý fel for to slepe. for weyrnesse of wandryng.

Piers Plouhman. Vision, p. 1.

Then wenne I to wyttē and with a whight I mette

A minoure in a *morwetide*, and to this man I saide.

Id. Crede, sig. B. i.

And counselide hem of Ihesu of the lawe of Moises and profetis
fro the *morewe* til to euentide.

Wiclif. The Dedis of Apostlis, ch. xxviii.

And preached vnto them of Jesu; bothe out of the law of Moses,
& also out of the prophetes, euen from *morninge* to night.

Bible, Anno 1551.

But whanne the *morowetide* was come, alle the princis and prestis
and the eldere men of the puple token counseil agens Jhesus.

Wiclif. Matthew, ch. xxvii.

But natheles it was so faire a sight,
That it made all hir hertes for to light,
What for the season, and the *morwening*,
And for the foules that she herde sing.

Chaucer. The Squieres Tale, v. 10712.

But by the cause that they shulden rise
Erly a-*morwe* for to seen the sight
Unto hir reste wenten they at night.

Id. The Knightes Tale, v. 2492.

The goodnesse that thou maist do this day, do it, and abide not,
ne delay it not til to *morwe*.

Id. The Tale of Melibeus, p. 119.

For he that stant to daie alofte,
And all the worlde hath in his wones,
To *morowe* he falleth all at ones
Out of riches into pouerty.

Gower. Conf. Am. book iv. p. 112.

The fourth watch was next to the *morning*, and was called the
morninge-watche. *Bible, Anno 1551. Matthew*, ch. xiv. note.

That ruddy *morning-beam* of majesty,
Which should the sun's eclipsed light supply,
Is overcast with mists.

Carew. Upon the King's Sickness.

He shall then so reveal himself to us as the sun shews himself to
the world, in the *morning-rising*, by degrees ascending to its full
height.

The prince by chaunce did on a lady light,
That was right faire and fresh as *morning-rose*,
But somewhat sad and solemne eke in sight,
As if some pensive thought constrain'd her gentle spright.
Spenser. Faerie Queene, book ii. can. 9.

And if that wrong on eyther side there were,
That he should warne the wronger to appeare
The *morrow* next at court, it to defend.
Id. Mother Hubbard's Tale.

About the daybreake betimes in the *morning*, the leaves of trees
are found bedewed with honnie; and looke whosoever they are,
that have occasion to be abroad in the aire about the dawning of the
morrow, they may evidently perceive their clothes wet with a
clammie humour of honie, yea, and their haire glewed therewith
together, if they goe bare headed.

Holland. Plinie, book xi. ch. xii.

The *morning*, we know, is commonly said to be a friend to the
Muses, but a *morning's* draught was never so.

South. Sermons, vol. iv. p. 356.

Still night succeeds,
A soften'd shade, and saturated earth
Awaits the *morning-beam*, to give to light,
Rais'd through ten thousand different plastic tubes,
The balmy treasures of the former day.

Thomson. Spring.

Set by old Ocean's side the goddess heard;
Then from the sacred deep her head she rear'd:
Rose like a *morning-mist*.

Dryden. Homer. Iliad, book i.

But who the melodies of *morn* can tell?

The wild brook babbling down the mountain's side;
The lowing herd; the sheepfold's simple bell;
The pipe of early shepherd dim descried

In the lone valley. *Beattie. The Minstrel, book i.*

To-morrow's action! can that hoary wisdom,
Borne down with years, still doat upon to-morrow!

That fatal mistress of the young and lazy,
The coward, and the fool, condemn'd to lose
A useless life in waiting for to-morrow.

Johnson. Irene, act iii. sc. 2.

M O R O C C O.

Name.

MOROCCO, which takes its name from Merákesh, changed into Morocco by the Italians, is an Empire at the North-Western extremity of Africa, gradually formed by the conquest and annexation of several contiguous States. The largest part of it consists of the united Kingdoms of Fez and Morocco, so named from their respective Capitals. To these were subsequently added the petty States of Dar'ah, Sús, and Tárudánt, on the South; Táfilelt, and Sijilmásah, on the West; and Mequinèz on the North. Its greatest length, from Ceuta, in 35° 54' 4" North and 5° 16' 6" West, to Cape Nún, in 28° 41' North and 11° 15' 18" West, measures 433 Geographical miles; and its greatest breadth, from the same promontory, its Westernmost extremity, to the meridian passing through the mouth of the Mulúyah, in 35° 8' North and 2° 30' West, may be estimated at 420 Geographical miles; but, as the coast from the Straits of Gibraltar runs in an oblique direction from North-East to South-West, its breadth Northward is continually diminishing, and is little more than 100 miles in the parallel of Arzila. Morocco (Merákesh) and Fez (Fás) were each divided into seven Provinces, thus enumerated by Leo Africanus (8.) and Marmol:

Extent.

(i. 6. pt. i. fol. 5.) 1. Heha; (Háhá or Háhet;) 2. Sús; 3. Gezúla; (Kézúlah;) 4. Morocco Proper; (Merákesh;) 5. Dukélah; (Dúkálah;) 6. Hazkóra; (Haskórah;) 7. Tedla; (Tádlah;) belonging to the former: and 1. Temezna; (Támesná;) 2. Fez; (Fás;) 3. Azgar; (Azkár;) 4. El Abath; (El Habat;) 5. Elrip; (El-Ríf;) 6. Garet; (Káret, or Gárat;) 7. Elcuz; (Elkheús;) to Fez. To these names others have been added by modern writers; as El Gharb, Sháwiyyah, and Bení Hasen, to Fás; Miskín or Zerárah, Shedmah, 'Abdah, and Rihámmah, to Morocco. Concerning their position, however, and, what is less extraordinary, concerning the orthography of their names, there is much discordance. Shedmah, the Shermah of Chénier, is spelt Siyádmah by Hæst, who has given the word in the original character, and the Shawiya of Jackson is the Chavoya of Chénier, and probably the Showiah of Shaw; but this last-named tract is contiguous to Bení Hasen according to the first, and is separated from it by Fás according to the second. 'Abdah lies to the South of Dukkálah, and between it and Siyádmah according to Jackson and Chénier; but

Divisions.

to the South of the former and to the North of the latter, if Hæst was rightly informed. This is the more remarkable, as they had all three travelled through those Provinces. But as there are few towns in Morocco, and the districts are generally named from the Barbar Tribes occupying them; whenever any of those Tribes, who are for the most part migratory, change their quarters, the name of the district is doubtless changed accordingly; and we learn from Chénier (iii. 8.) that "the extent of the Provinces varies according to the will or interests of the Prince, the caprice of Governors, and other temporary circumstances."

Of these Provinces, all, except Sús, Sijilmásah, Táfilelt, and Dar'ah, are on the Northern declivity of Mount Atlas, which descends more or less abruptly to the sea, forming bold and lofty promontories at Ape's Hill, (Abyla of the Ancients, called Jebel dhá-zza'tút, i. e. Ape's Hill by the Moors, (Jackson, p. 10.) in 35° 54' 4" North and 5° 16' 6" West,) Cape de Geer, (Cabo de Aguer, (Marmol, i. 18. c. 27.) in 30° 38' North and 9° 51' 36" West, now called Ferní, or Aferní, by the Moors,) and Cape Nún, in 28° 41' North and 11° 15' 18" West. The highest part of Mount Atlas* appears to be that portion of it which lies between Sús and Telemsán, (Tremecen,) some peaks of which are always covered with snow, and must therefore rise at least to the height of 10,800 feet above the level of the sea. "Deren," says Idrísí, (Clin. iii. pt. 1.) "is a mountain equalled by few in height, fertility, extent, and populousness. It begins from the Ocean on the shores of Sús el aksá, and runs Eastward nearly in a straight line till it reaches Mount Nefúsah, and afterwards the mountains of Tarábulus, (Tripoli,) where it gradually sinks into the plain. Several persons say that it reaches the sea at the promontory called Aútán. It abounds in all kinds of fine fruits and extraordinary trees. Water bursts forth from it everywhere,

Position.

Jebel dé-z-
za'tút.
Ape's Hill.

Deren.

* Atlas was named *Dyris* or *Adiris* (Strabo, xvii. p. 825. Plin. Nat. Hist. v. 1.) by the ancient Africans, according to the Greeks, whose accusative case, *Dyrin*, approaches very nearly to the Arabic *Deren*. *Adir* is almost identical with the Barber word *Edrar*, or *Edirar*, "a Mountain." The writers on Africa have been most unlucky in their etymologies. Hæst derives Atlas from the Arabic word *ila*, signifying the sunrise. Others have mentioned *jebel et-tils*, a corruption of *jebel el thelj*, (snowy mountains,) as the origin of Atlas.

MO-
ROCCO.

and on both its sides there is a constant verdure at all seasons." The whole tract, says Marmol, (i. 7. tom. i. fol. 6.) from the Southern extremity of Sús to the Straits of Gibraltar, is extremely fertile, abounding in corn-land and pasture, being all a level and undulating country, traversed by many capital rivers, which descend from the greater Atlas and flow into the Atlantic Ocean. From the same Straits Eastward, as far as Tripoli in Barbary, the whole is a hilly country, occupied by chains of mountains, which in some places extend thirty or forty leagues inland; and between these mountains and the greater Atlas there are extensive plains, and in some places hills (*lomas*) and low ridges; but the soil is fertile in bread-corn (*pan*) and grass for cattle, abounding in springs and streams, which descend from the mountains, and enter the Mediterranean, with pleasant and delightful banks adorned with shady groves, especially towards the confines of the City of Cayraúen; (Kaírawán, the ancient Cyrene;) for from thence forwards the soil becomes sandy and dry. The Coast of Barbary, called Er-ríf, is formed by the lower range of Atlas, where cold prevails rather than heat, and more barley than wheat is produced; but the former is the principal food of those nations. The mountains are often covered with wood, and have extensive summer-pastures; but, if not removed in time to the low lands, the cattle are often killed by the heavy snows in Winter. The mountains of the higher range of Atlas are in some places too cold to be habitable, full of crags and precipices overhanging deep and gloomy valleys, shaded by forests of large and lofty trees, and giving rise to considerable rivers. Other mountains, much more temperate and agreeable, are peopled by large communities and Cobeylas (Kobeilahs) or Tribes of African Beréberes. (Berábbers.) The most rugged and craggy heights of the greater Atlas, are those overhanging the Province of Temícena (Támesná,) and the coldest, those above the Province of Morocco. The shepherds always pasture their flocks in those mountains in Summer, but take care to remove them before the snow begins to fall, as it is usually accompanied by a Northerly wind (*cierzo*) so cold as to kill the sheep, and sometimes the shepherds themselves. There is a passage in these mountains near the city of Agmet, (Aghmát,) through which the Numidians (Tawárik) pass every year with their camels laden with dates, and so much snow sometimes falls at that season, that in a single night they are buried, both men and beasts, under two lances' depth of snow. (*dos lanzas de nieve*.)

Rivers.

Mulooia,
Mulluvia, or
Mulwia.Elcos, or
Luccos.

These mountains give rise to all the rivers in the Empire of Morocco; the principal of which are, 1. the Mulúyah, or Mulwiyyah, which rises in the Province of Kheús about 25 miles from Garsi-Luñ, and flowing in a North-Easterly direction through the rugged and desert plains of Ankad and Káret, (Anged and Garet,) and bathing the foot of the mountains of the Bení Zenátah, (Yeznátah, Leo, 715.) empties itself into the Mediterranean near the town of Kasasa. It is joined in its course by the Mulull, Sá, (Zha of the Maps,) and other streams, and forms the Western boundary of the Empire. 2. The U'lkús, or U'lukkús, rising in the mountains of the Bení Ghomárah, flows Westward through the plains of Habat and the Azkár, passes by the town of Kasr-el-kabír, and falls into the sea at El'Aráish, (Larache,) a town belonging to the last-named Tribe, and having a port, the entrance of which is obstructed by a dangerous bar. 3. The Subú, one of

the largest rivers in Morocco. It rises in Mount Selíligó in the Province of Kheús, in a thick forest; and winding through the valleys into the plain, passes within six miles from Fás. (Fez.) It receives the Wádí el jewáhir, (Jewel River,) which flows through that city, and many other streams in its course, and enters the sea at Ma'mórah, twelve miles from Salá. It has a very deep mouth, and is navigable for some distance. Like most of the other streams in this Country, it is very low and fordable in many places, in the dry season of the year. 4. The Búreghegh, springing from one of the branches of Mount Atlas, in the Kingdom of Fás, passes through deep ravines in the mountains, into the level country, through which it flows into the sea between Salá (Salee) and Rabát. The bar at its mouth is so dangerous to inexperienced navigators, that it was formerly considered as a great protection to those towns against the attacks of Christian fleets. 5. Ommu-r-rebí' (corruptly in modern times Omm-arba') springs from Mount Atlas on the confines of Fás and Tádlah. (Tedla.) It flows first through the plains of Adaksúm, (or Adakhsún,) and afterwards, descending through a narrow valley into the lower plains, divides the Province of Támesná from those of Tádlah and Dukkálah, (Duquela,) discharging itself into the Ocean beneath the walls of Azammór. It receives in its course the Wádí l'abíd, (Hued la Abid, Marmol, i. fol. 8.) i. e. Slaves River, and the Dernah, which flows from the same mountains. It is never fordable, and abounds in fish, particularly shad, (*sábalos* = *Clupea alosa*.) 6. The Tensíf rises in Mount Atlas, near Animmeí, or Hanimmeí, to the East of the City of Morocco, and, flowing in a North-Westerly direction, falls into the Atlantic near Asafí, (Safi,) in the Province of Dukkálah. It is increased by many streams, particularly the Esifelmel, the Niffís or Nefúsah, and the Aghmát. Though generally deep, it is fordable in some places. It is crossed at Morocco by a bridge of fifteen arches, erected by the Sultán Ya'kúb Al-mansór, and considered as one of the finest in Africa. 7. Wádí Sús, the River of Sús, rises in Mount Atlas, on the confines of Sús and Háhá, and taking a South-Westerly course, passes by Tárudant, and enters the sea near a place called Gertzen. (Gertásen?) It is drawn off in canals for the purposes of irrigation to so great an extent, that in Summer-time the bar at its mouth is fordable at low water. 8. Wádí Nún, the River of Nún or Núl, may be considered as the Southern boundary of Morocco. It is also called the River of Akasah, (Jackson, 9.) but is little known; being on the borders of the Desert, (Sahrá,) it is probably inconsiderable and unnavigable. There are two considerable streams South of Atlas. 9. Wádí Filéli, the River of Táfilelt, terminating in a small lake; and 10. Wed Der'ah, the River of Der'ah, finally lost in the sands.

The climate varies greatly in the different regions; and as the South-Western branch is the highest range of Atlas, there is a greater diversity of temperature, at different seasons, in Morocco than in the other Barbarous States. In the low lands the rains begin at the end of October, and the greatest cold is felt at the end of January; but at noon a fire is never wanted. In February the cold decreases, and the weather is very variable. Boisterous winds from the West and North (*cierzos*) prevail in March, and almost all the fruits are set in April. Cherries are ripe at the end of that month, and early figs (*brevas*) by the middle of May. Grapes

begin to ripen on the 25th of June. Apples, pears, peaches, apricots, &c. are ripe in the beginning of July, figs in the beginning of August, and the latest fruits early in September. Raisins are dried in that month; unless early rains or heavy dews fall, and then their juice is converted into a rob, (*rób*), or vinous syrup, (*arrope y vino cozido*), much drunk by the Berbers. (Beráber.) Olives are gathered in November, but the trees, as in Europe, bear plentifully only every other year. The Spring begins on the 15th of February, and ends on the 18th of May. If no rain fall between the 5th of April and the 5th of May, a scanty harvest is the certain result. The hot season begins on the 19th of May and ends on the 16th of August, and the greatest heat prevails in June and July, in which months exposure to the night air is not hurtful. The rains in July and August occasion pestilential fevers and much sickness. On the 17th of August the Autumn begins, and it ends on the 17th of November, the heat having gradually diminished in August and September. The Winter begins on the 17th of November and ends on the 14th of February; and at the commencement of that season they sow their fields in the low lands; but in the hills they begin to sow in October. From the 12th of December to the 20th of January the weather is usually very cold; and from the 12th of June to the 21st of July excessively hot. The East, South-East, and South winds in May and June often do much mischief, blighting the grain and fruits, and preventing their coming to maturity. There are also in those months thick fogs, which are injurious. In the mountains there are only two seasons: Winter from October to April, and Summer during the remainder of the year. The plains, wherever there is water, are very fertile; and the industry of the mountaineers compensates for the want of soil and level ground: they make terraces with stone walls along the sides of their hills, and are thus enabled to raise large crops of barley. In the Country to the South of Atlas (*Biládu-l jeríd*) the grain ripens in May, and the dates in October. If the rain on the mountains fail, all the rivers are dried up; but if rain fall in September, the dates are spoiled, and the inhabitants depend much more on that crop than on their harvest of corn. (Leo, 82.) The most remarkable vegetable productions of Morocco are, 1. the 'Arar, (*Thuja articulata*), which yields the gum sandarac. 2. The ferbiyún, or ferfiyún, *dergemeuz* in the Berber tongue, (*Euphorbia officinarum*), the inspissated juice of which is the gum euphorbium. 3. The fashúk, (probably a species of *Ferula*), which, according to Mr. Jackson, yields the gum ammoniac. 4. Surnag, perhaps the *súranján* of the Arabs. (*Iris tuberosa*.) 5. Talhts, (*Acacia gummi-fera*), common throughout Tropical Africa. 6. El rassul, (El ghásúl), mentioned by Mr. Jackson, (78.) the *Salsola fruticosa*, very common on all the shores of the Mediterranean. And 7. the arkán (*Elæodendrum argan*) is not only peculiar to Morocco, but one of its most useful vegetable productions. Idrísí, (*Cl. iii. part i. MSS.*) in speaking of the fertility of Mount Ténmelet, (*Tánmilát*), says, "There is also on this mountain a large tree, called in the Berberí tongue arkán, (pronounced argán,) of which the boughs, branches, and leaves resemble those of the plum-tree. (*Ijjás; Prunus domestica*.) It has a fruit like that of the damascene; (*uyún*, probably *uyún-el-bakar*, i. e. bull's eyes;) when of early growth its outer rind is thin and green, but when completely ripe it is yellow. It is exclusively

VOL. XXV.

astrigent and acid, and contains a hard nut like that of a moderate-sized olive, (*el zeítínatu-l mahdúdatu-l rás*.) The taste of this fruit is not good at all. It is gathered at the end of September, and given to goats, who swallow it, after having eaten its outer rind, and afterwards void it whole. It is then gathered, washed, bruised, and its kernel ground and pressed, when there issues from it much oil of a clear colour but unusual appearance; it is not pleasant to the taste, and is very bitter. They use it on account of its plentifulness, for lighting their lamps, and the tavern-keepers (*el dukháníyún*) in the markets fry sponges (*el-uspínj*, i. e. balls of pastry) in it. As soon as touched by the fire, it emits a disagreeable, pungent odour; but in the sponges it loses its unpleasant taste. The women of the Masámadah Berbers anoint their heads with it while combing; and it beautifies, lengthens, and renders their hair finer, and also preserves its blackness." It is described by Leo, (100.) and by Marmol, (iii. 2.) (who seems to have seen it, but who does not transcribe either Idrísí or Leo,) as a thorny tree, whose fruit is bigger than large apricots, (*albarcoques*), with nothing but a skin over the stone, (*al cuesco*), and whose berries when ripe shine in the darkness of the night like stars. "This fruit," he adds, "is eaten by goats; and the Africans afterwards gather its stones in their cattle-yards, (*corrales*), for they are so hard that they cannot break them, but drop them whole, and from their kernels they make that stinking and ill-tasted oil." (vol. ii. fol. 2.) Veins of gold and silver are said to be found in the mountains, especially in those of Sús; but there seems to be no very satisfactory evidence for the existence of either. Lead, copper, and iron probably occur in several places; and the last two are extracted and worked to a small extent. Rock-salt, saltpetre, and antimony are likewise obtained in large quantities. The neighbourhood of Táfilélt (*Táfilált*) is the tract of country which principally furnishes the last; and Elkohl-el-Filélí,* the antimony from Táfilélt, is in great request, being the principal ingredient in the kohel, (*stibium*, or *collyrium*), with which the Maroquine women blacken the edges of their eyelids.

The animals of Morocco are, with few, if any exceptions, common to the rest of Northern and Middle Africa; but it is possible that the mountainous regions and Southern Provinces may contain some species peculiar to that Country, though it is very probable that those mentioned as such in the imperfect accounts which have hitherto been published, when examined by Naturalists, will prove to be nothing more than varieties of species previously known. 1. The horreh is probably the *Antelope cervicapra*, or stag-goat antelope of modern Naturalists. 2. The aúdad, mentioned by Mr. Jackson (33.) as an inhabitant of Southern Atlas, and a great rarity, is probably the *fishál* or *lérwí* of Shaw, (171.) (*Antelope lerwia*), supposed by him to be the *tragelaphus* of the Ancients. The skins which he sent to Sir Joseph Banks, if they were preserved, are now in the British Museum. 3. The sibsib, or sebseb, (Jackson, 36.) is probably a kind of squirrel. (*Sciurus gætulus*.) Its flesh is like that of the rabbit, but, according to the Berbers, not palatable, unless its back has been rubbed

* This derivative, *Filélí*, seems to show that the initial *tá* is an article; it seems with the final *t* to mark the feminine gender in the Shilahh or Berberí language. (*Notice sur la Langue Berbère*, in *Voyage de Hornemann par Langlès*, p. 416. 430, 431. &c.)

MO-
ROCCO.Inhabit-
ants.National
character.Supersti-
tions and
customs.

against a hard surface, while the animal is alive. 4. The heírrí, or moherrí, called hájín by the Arabs in Egypt, is a variety of the camel, whose swiftness and endurance of labour are, according to the Moors, such as almost exceed belief. 5. The rogr is a kind of partridge. 6. The tibíb, something like a sparrow; and 7. the elhájj (*i. e.* the pilgrim) is an ash-coloured bird, rather less than a blackbird. 8. The shábil, (pronounced shébel,) whence the Spanish word *sábalo*, is the shad. (*Clupea alosa*.) It is found abundantly in the Ummu-r-rabí', and is said by Mr. Jackson (71.) to be one of the best fishes brought to table in Morocco.

The population of Morocco is formed by the Berbers, who inhabit the mountains; and the Arabs, either migratory or stationary, who occupy the low lands and the towns. The former, of whom a full account has been given under the head BERBER, are usually called Shulúhh (in the singular Shilahh) in the Empire of Morocco, and are subdivided into Tribes; many of which frequently migrate, as well as the Arabs with whom they claim a very ancient affinity. The latter are probably a mixed race, derived 1. from migratory Tribes; 2. from the soldiers who subdued and expelled the Goths and Vandals; 3. from the wreck of the vanquished nations; and 4. from Negroes imported from the South. As a nation they are now described as generally of a middle stature; not so muscular as Europeans, thick and clumsy about the legs and ancles; of a dark complexion from swarthy to a complete black; having regular white teeth and black hair. Their women are often handsome, particularly those of Mequinez, (Miknásah,) whose complexion, which can vie, according to Mr. Jackson, (137.) with that of English beauties, is set off by large, black, expressive, and sparkling eyes; so that Miknásiyyah (*i. e.* a woman of Miknás,) is proverbially used to signify a beauty. Their modesty and suavity of manners, he adds, equals their personal attractions. "The men of Támesná and Sháwiyah," he observes, (137.) "are a strong, robust race of a copper colour; their women possess much beauty, and have features highly expressive:" but these are probably of Berber race. They all tinge their eye-lids with al kohl, (*stibium*,) and their fingers with hinnà, (*Lawsonia inermis*,) as is done universally in Mohammedan Countries. Influenced equally by their Religion, Government, and Climate, the Moors are indolent and taciturn. Jealousy, deceit, and cruelty, the other bad qualities by which they are often characterised, are also the natural consequences of living under an unlimited and unenlightened despotism, and professing a Religion which fosters revenge and intolerance. The evil influence of that perverting Faith is no where more strongly exemplified than in Africa, where even the kind-hearted and grateful Negro is often converted by it into a morose and ferocious bigot. But the turbulent passions and vivid imagination of the African seem every where to make him the slave of superstition; and thus the simplicity of the Mohammedan Creed has been no where more perverted than in Barbary and other African States. Among the peculiar customs of the Moors, several are deserving of notice. On the seventh day after the birth of a child a sheep or goat is slain on behalf of the infant, who is then first named. Twins are always called Hasen and Hosein, in honour of the twin children of 'Alí and Fátiméh. Education begins at six years of age, and most children learn to read and write; those who are designed to be men of learning get the whole of the Korán by

heart. Excepting when at school, the boys are generally allowed to run about where they please. As luxury is quite unknown, except at Court, and the Moors can live on very little, they usually marry very early, either in or before their twenty-first year. The bride is disposed of, if she have no father or near male relation, by the Kádí, for £10 and upwards, when the suitor has money. The marriage contract is settled, and a breakfast given by the father, half a year before the marriage takes place. The bride is carried to her new home, enclosed in a four-cornered cage adorned with silk handkerchiefs, Nuremberg looking-glasses, &c., and all their stock of powder is fired off by the bridesmen who accompany her train. If the bridegroom, who is well mounted, wishes to play the great man, he holds a handkerchief or his hháik to his mouth. The remaining rites are like those of other Mohammedans, except that the bridegroom is not suffered to see his wife's face till after the marriage has been completed. The bride is not allowed to go out of the house for eight months, nor the bridegroom for eight days after their marriage; and the first week is passed in festivities, during which the bridegroom is treated as a mock king by his friends, issues his commands, passes sentence, and inflicts punishments on offenders. Each wife of those who can afford to have the legal number, has a separate house, and the husband usually locks the door after him whenever he goes out: but the very precautions taken to prevent infidelity are said frequently to act as incentives to it. That vice, therefore, is by no means uncommon, notwithstanding the cruel fate which awaits the women who are detected in their transgressions. In cases of infidelity or insubordination, the husband can divorce his wife without returning any part of the price paid for her. The wife, on the other hand, can claim a divorce if she can prove that he has refused to give her a maintenance, has cursed her, or thrice sworn to her falsely. If a divorced wife has a child at her breast, she is not allowed to wean it for two years, and her husband must maintain her during the whole of that time. A widow mourns four months and ten days, wearing a black head-dress and no finery: if pregnant, she must continue her mourning till she is brought to bed. The Moors go to bed in the dark; get up before sunrise; go to prayers at the mosque, (*jámi'*,) and then usually pass the rest of the day in doing nothing. Penury is here, as in Turkey, assumed outwardly as a preservative against the extortions of the officers of Government.

Their first meal is usually hasú, a kind of gruel made of flour and water, seasoned with a little oil and salt; they wait patiently till it is cool, as they are forbidden to blow upon it for the purpose of cooling it. (*Risalah* of Ibn Abí Zaíd el Kaírawání, ch. xl.) Bread is eaten with grapes, figs, or melons, at noon, and a little before sunset they dine on kuskusú. This dainty is placed on a low table, round which they squat down, and each man helps himself to a handful out of the dish, for knives, forks, spoons, and table-cloths, are luxuries with which they are unacquainted. Kuskusú is paste made of wheat flour, and exposed to the steam of meat while boiling; when dressed it is served up under the meat, and garnished with hard eggs and boiled garvawzos. (Chick peas; *Cicer arietinum*.) The rich season it with butter and saffron. They finish their dinner with fruit, lick their fingers, cry out *El hemdo li-llah!* (God be praised,) wash their hands, and the table is removed. They prefer stale butter (*semen*) to new,

Dress.

(*zebdah*.) and the purchasers taste a sample of it put into a hole in the shop-wall, which hole is never washed, and seldom emptied, so that its savour may be easily imagined. Sfung, (*i. e.* sponge,) a kind of pastry; Abú Fortúnah, (*i. e.* Father Tempest,) minced-meat dressed with almonds and vermicelli; and morosiyyah, a ragout of boiled meat, honey, almonds, and raisins, are their remaining dishes. A bag of roasted meal is all their provision on a journey. Like other Mohammedans, many of them indulge in drinking wine privately; they are very fond of tea, which is drunk by them as much as coffee in the Levant and Egypt, and they never smoke tobacco. Hemp, (*hashishah*.) however, is considered as a lawful source of indulgence: the poor chew its seed and leaves; the rich boil up both leaves and stem together with honey and spices into an electuary, (*ma'jún*.) one tea-spoonful of which is sufficient to turn their head. They also smoke it through water by a contrivance which they call *argilah*, (a corruption of the Persian word *nárgilah*, signifying the *kalyán*, or *hukkah*.) and they likewise eat opium to a great excess. A wife, a horse, and a gun are the summit of a Moor's ambition, and if by chance he should become rich, he only wishes to increase their number. Public news and love affairs are their ordinary topics of conversation; and the women welcome their guests by shouting out *lu! lu! lu! lu!* at the utmost pitch of their voices. *Wak! wak! wak! wak!* on the contrary, are their exclamations expressive of grief. The conqueror at chess, (*setrenj*.) which they never play for money, sticks a straw or feather into his adversary's turban, which is considered as a serious disgrace. Their favourite sport, at all public festivities, is the *la'b-el bárúd*, (powder game,) in which the opposite parties fire off charges of powder at each other, instead of throwing jerids; so common in Egypt and Barbary. In the sport called *hádírún*, they form in a semicircle and fire off their pieces, one after the other, in regular succession. This is used as a salute of honour, and a sort of muster-roll when the army is encamped.

In their salutations, the lower orders stoop down, placing their right hand on their right knee, and bend their head on one side. Before the King they prostrate themselves on the ground, and kiss the earth. Women kiss men's hands; especially wives their husbands': and, as is the case with other Mohammedans, their customs are, in many respects, exactly the reverse of ours. We, for example, turn our horse's mane to the left, they to the right. We withdraw from the presence of Kings and persons of distinction slowly, and with our face towards them; they turn their back on the King as soon as their audience is over, and run out as hard as they can. We stand up to show respect and for other purposes; they squat down. When unmarried they go bareheaded, having, like other Musulmans, their heads shorn with the exception of a single lock. When married they wear either a red woollen cap; (*sháshiyah*, vulgarly pronounced *sésiyah*;) or if a Sheríf, (*i. e.* descendant of Mohammed,) Hájj, (or Hajj, *i. e.* a pilgrim,) Kájíd, (Governor,) Reïs, (sea-captain,) or Tálib, (pronounced Tálb, *i. e.* a seeker of knowledge or student,) they wear a shedd or 'amámah, (*i. e.* a binder,) that is, a muslin handkerchief or other fine white cloth, twisted in a peculiar manner round the red cap. A shirt (*kamtsah*) with an embroidered border round the neck and long open sleeves, is their under garment; a tunic (*kaftán*) of red, blue, or green cloth, often em-

broidered, and hanging down a little below the knees, is the next part of their dress. It is thick set with small buttons in front. Instead of this the common people wear a (*keshsháb*) woollen shirt without sleeves. A leathern girdle (*modámmah*) round the waist, buckled in front, or a broad silk scarf or sash, (*hhazám*.) are worn over the kaftán by the rich, and a full outer wrapper of white woollen cloth, called *hháik*, four yards and a half long and two broad, is worn by every Moor from the King to the lowest peasant. A surtout (*zol-ham*) of the same kind of cloth with a hood is often worn over the other clothes. White linen trowsers (*serwál*, from the Persian word *shelvár*) are worn by the rich. The men wear yellow Morocco-leather slippers, (*sherbíl*.) the women red. The soldier hangs his sword (*sikkín*.) by a thick band of broad lace over his right shoulder; and every man wears a dagger (*komiyyah*) in his belt. An inferior Káid, or officer of police, is distinguished by a plaited leathern whip, a full finger thick, (*asfíl*.) hanging over his shoulder, with which he inflicts punishment when necessary. The devotees are distinguished by the shape of their slippers, by carrying a rosary, (*tesbíhh*.) and by holding their noses when they meet a Christian. The women fasten their *hháik* over the breast with a little chain and hooks, and those of the lower orders wear nothing under it: others wear sleeveless shifts, kaftáns, linen mansóriyyahs, (or mantles,) and a *hhazám*, or sash round the *hháik*. Married women are not allowed to show their hair; but conceal it under a silk veil, (*'abruk*.) the ends of which hang down behind the back, the front being twisted round the forehead like a turban. They wear double ear-rings, bracelets, armlets, and rings, on their fingers, toes, and ancles; silver tags, which jingle whenever they move, are attached also to the tresses of unmarried women whose hair is allowed to be seen. They wrap themselves up in their *hháik* when in public, so as to let only one eye be seen. The only part of their dress to which the men pay much attention is their beard, which they often comb and perfume. When dead, the corpse of a Moor is well washed, and then clothed in a shirt, long linen trowsers, and slippers. A linen sheet is lastly wound round the head, and the whole corpse is sowed up in it. They ought to be buried with at least seven pieces of linen. (*Málik*, ch. xx.) The corpse is then placed on a bier, carried to the *jáma'*, (mosque,) where prayers are chanted, and is at last removed to the burial-place outside of the city, where it is laid in the grave with its head a little raised, resting on its right hand, and its face turned towards Mecca.

The inhabitants of towns may be divided into five classes: 1. those of Arabian, 2. those of Berber descent; 3. the Andalusís, or Moors of Spanish origin; 4. the Free Negroes; and 5. the Jews. The first two have been already noticed: the third is rarely found to the South of Azamòr, but Moors of this class are numerous in some of the Northern towns and districts. They still retain in part their original Language, and are, on the whole, more civilized and enlightened than the rest of their Countrymen. The fourth class are either manumitted Negroes, the descendants of Moors by Negro mothers, or the offspring of the Negro soldiery employed by Múlái Ismá'il; under whom, not only the whole army, but almost all the offices of State, were filled by Negroes, who were called either 'abíd harár, (free slaves,) or 'abíd Sid el Bukhári, (slaves of our Lord the Bukharian,) as being under the patronage of El

Bukhári, one of the most renowned of the Moorish Saints: for those holy personages are chosen as Patrons, and their houses (*horom*) and tombs (*záviyah*) are places of refuge for malefactors in Barbary, as well as on the opposite side of the Mediterranean. Mulattoes are called Kharín, and the Eunuchs (*Emfethím*, or *Mofethín*) of the Moorish harems are always Negroes. The fifth class, or Jews, consists principally of descendants from those who were driven out of Europe in the XIVth and XVth Centuries; some others, of Asiatic origin, who call themselves Pilistín, are said to live among the Beréber (*Beráber*, i. e. Berbers) in the mountains. Those in the towns are under the King's immediate protection, for which they pay an annual sum. Morocco, Fez, and Tetwan 500 ducats; Salee and Rabát 400; Mequinez and Mogodor 300; Larache and Tangier 100, and Argilla only 60: but each male above twelve years of age pays one ducat (5s.) as the annual capitation-tax. These sums, collected by the Sheikh, and presented to the King at the Feast of Ramadán, are styled *Dejé-zah dehib l'úléd-hà*, (*Dejájah dhehel bi wullád-há*), the golden hen and chickens. The insolence, injustice, and contempt with which they are treated, exceeds all bounds: their children are often stolen by zealous Musulmans, that they may be brought up in the true Faith; and when disobedient, they turn Mohammedans if punished, or save themselves from chastisement by threatening to do so. The poorest Jews are labourers; and those engaged in each different kind of labour, are formed into separate companies placed under their proper overseers, (*amán*), who distribute their daily pay to each, retaining a double portion for themselves. They work from eight o'clock till four, leaving off at the time of afternoon prayer, (*salát-el-'asr*), and crying out *Allah yerhham Múlái Idrís*, "God have mercy on our Lord Idrís!" the founder of that regulation. The Jews are governed by a jim'ah, or Common Council, chosen from among themselves, and regulated by a Sheikh, (Senior, or President,) who receives the King's commands, collects the assessments, fines and punishes; but there is an appeal from his sentence to the Musulmán tribunals. Their Rabbis, though much revered, are not invested with any temporal authority, but their sentence of excommunication (*harúr*) is much dreaded. They are obliged to wear black caps, wrappers, (*bernús*), and slippers; and their Rabbis are distinguished by wider sleeves, a red mark on their *bernúses*, and blue handkerchiefs round their heads. The Renegades, (*'aljí*), who are, as may be conjectured, among the most worthless of mankind, are almost as much despised as the Jews, and kept in a state of galling subjection to the Káids, under whose inspection they are placed. Except under such monsters as Rashíd and Ismá'il, the condition of the Christian slaves was always better in Morocco than in the other Barbaresque States; and for the last seventy or eighty years they have been treated as prisoners of war, and exchanged at the termination of hostilities. They were always considered as the property of the Sovereign, and therefore not liable to a change of masters; and in latter times had frequent opportunities of making money and living better than at home. The commanders and officers were exempted from manual labour, and not exposed to very severe hardships. The Negro slaves appear to be, on the whole, more harshly treated in Barbary than in Egypt or other Mohammedan Countries. Their masters have, to some extent, the power of life and death; but a Negress who is preg-

nant by a Moor is liberated if he die before the birth of his child; and no one can sell a slave by whom he has had children. (Höst, 106.)

The Emperor, who styles himself Khalífah, Imám, and Emír-el-múminín, assuming the titles and authority of the legitimate successors of the Prophet, is usually called Sultán, Síd-ná, or Sídí, by his subjects, over whom he exercises an uncontrolled authority; for under their most despotic Emperors, such as Múlái Rashíd, (Archy,) and Ismá'il, (Semeín,) the dignity and supremacy of the sacred Law (*Sher'i sheríf*) was never suffered to thwart the will of the despot. He has no Council, but carries on all public business by means of his secretaries, and holds a public audience (*musháwereh*, vulgò *moshwár*) twice a week in the open air. His revenues in 1763 were thus estimated by M. Høst, the Danish Vice-Consul at Mogodor.

Excess	700,000

And as Mohammed, the Emperor then reigning, took wise measures for the augmentation of his revenue, and had been in undisturbed possession of the throne for twenty-two years, the same writer supposes that he must have accumulated a treasure of thirteen millions of dollars, (nearly three millions sterling.) That accumulation has, however, been, in all probability, considerably diminished, if not entirely absorbed, by the Civil commotions which have since occurred. The population of the Empire is variously stated and sometimes so high as 15,000,000; but 6,000,000, another account, appears to approach nearest to the truth. The army amounts generally to about 40,000 men, many of them originally Negro slaves: the navy to about 20 small frigates, a few shebecs, and 30 galleys, occupying about 6000 seamen. The trade with Morocco would be advantageous to European nations, were it not liable to so many contingencies; as manufactured goods are the imports, and raw materials the exports; but it may be doubted whether the Moors can afford to pay for goods so costly as the products of our manufactories. The annual imports at Mogodor have been estimated at £151,450; the exports at £127,679: but where so much depends upon the will of an unenlightened and absolute Sovereign, there can be no stability or security; these statements, therefore, furnish no ground for calculation beyond the time at which they were made, and as merchants will not readily employ their capital in a branch of commerce liable to so many risks and so much uncertainty, our intercourse with Morocco is not likely to be soon increased to such an extent as to make our trade

Trade.

MO-ROCCO. with that Country an important part of foreign commerce.

The weights, measures, and money used in the Empire of Morocco are :

Weights.	i. <i>Weights.</i>
Quintal.	1 Kintal, or kantár (from quintal) = 119 lbs. = 100 lbs. avoirdupois.
	1 Kintar el 'arúb = 75 lbs. = 79 lbs. 5½ oz.
	1 Pound (market weight) = 1 lb. 12½ oz.
Coola.	1 Kúlah = 22 lbs.: this measure is used for olive oil.

All weights and measures are under the inspection of the Mutehhásib, an officer appointed for that purpose in every town.

Measures.	i. <i>Dry Measure.</i>
Saha.	1 Ssahh = 60 lbs. at Mogodore, 50 lbs. at Asafí, } used also for
Mood.	2 El mudd = 15 lbs. 12½ lbs. } argan oil.
(Bushel.)	

ii. *Long Measure.*

Dra, cubit, or caña.	1 Dhirá' (i. e. cubit) = 21 inches.
----------------------	-------------------------------------

Money.

i. *Gold.*

	1 Bendikí (i. e. Venetian zecchin) = 9s.
	1 Methú', or mithkál áheeb (gold metkal) called gold ducat = 4s. 8d.
Miskel.	1 Mithkál, or ducat, (an imaginary coin) = 10 waklyahs = 3s. 4d.

ii. *Silver.*

Derhan.	1 Dishem, (drachm,) or wakiyyah, (pronounced úkíah,) i. e. ounce = 4 mauzúnahs = 4d.
---------	--

Musuna, or blankeel.	1 Mauzúnah, or blanquille = 24 fulus = 1d.
----------------------	--

iii. *Copper.*

Fels, or floos.	1 Fels (in the plural fulús, or fulus,) = ¼ of a farthing.
-----------------	--

Spanish coins, weights, and measures are also much used throughout Morocco.

Towns. The principal towns, following the coast from the mouth of the Mulúyah Westward, are: 1. *Melilah*, (35° 18' 15" North, 2° 56' West,) in the Province of Káret, a very ancient town, called Deírat Milílah (the honied city) by the Berbers, from the abundance of honey and wax in its neighbourhood. (Marmol, iv. 91.) It is supposed by some writers to be on the site of the ancient Rusadir,* (Plin. *Nat. Hist.* v. 1.) and was a place of considerable trade under the Arabs; but its inhabitants having become troublesome pirates, it was taken by the Spaniards in 1496, and has remained in their power ever since. To the East of the town there is a lake, or lagoon, more than seven leagues in circumference, capacious enough to hold 1000 galleys, and communicating with the sea by a narrow mouth opened in or about 1555. There are also salt-pans near the town, formerly used by the Moors.

El Peñon, or Velez de la Gomera. 2. *Velez de la Gomera*, (Bádis, or Bádís of the Bilád (land of) Ghomárah,) in the Provinces of El-ríf, about twenty Geographical miles West of Melílah, is called Deírat Bédís by the Beréber, and in Marmol's time (iv. 62.) contained 700 houses, and therefore nearly 4000 inhabitants. It is placed in a large valley between two lofty mountains, and is watered by a torrent; but has no other supply except from a well outside the town close to the sepulchre of Sídí Buwasa, a morábit (saint) of great reputation: the well, however, is much infested by leeches. (*sanguisuelas*.) It has a port capable of containing thirty vessels, (*bageles*.) and therefore its inhabitants soon became Corsairs. It was the Eastern extremity of the land of Ghomárah, a mountainous tract, beginning at the Port of Anzilán, (thirty-five miles East of Tetáwin, according to Idrísí, (*Cl.* iv. pt. i.) and probably the Anjerà of Leo, (417.) one of the eight mountains of Hhabat,) which was supplied with timber for shipping by the neighbouring mountaineers. The Ghomárah Tribe, though Mohammedans, were much given to wine, with which they were supplied, says Marmol, (ii. fol. 136. a.) by a Jewry (Judería) of more than one hundred houses. Count Pedro Navarro, in 1508, built a strong tower, called El Peñon, (i. e. the great rock,) on a cliff (*peña*) in the sea, in front of the city, and 700 paces from it; it was gallantly defended against an overpowering force under Múlái El-Mansór, King of Fás, but taken by treachery under his successor. The town has been long since abandoned, and the fort is, according to Hæst, (89.) "a small, insignificant castle, in 35° 15' North, belonging to the Spaniards."

MO-ROCCO. 3. *Tetáwin*, or *Titáwin*, (i. e. eyes* in the Berber language, (Venture's *Voc.* in Hornemann's *Trav.* 443.) as Leo (412.) informs us,) is in 35° 36' North and 5° 24' West, and belongs to the Province of El Hhabat. It is seated on the banks of the River Kheus, (Cuz,) which flows into the sea seven leagues to the East of Ceuta, (Marmol, iv. 51.) in an agreeable spot, one league from the sea-shore, and twenty-two leagues from Velez de la Gomera. The beauty of its gardens, and the excellency of its oranges and grapes are much extolled by Mr. Jackson, (92.) and by Hæst, (88.) who says that it is the most agreeable place of abode on the whole coast, because its inhabitants, who are almost all Andalusian Moors, are more civilized than the rest of their Countrymen, and all speak Spanish; he estimates their numbers at 14,000. It was formerly the residence of all the European Consuls; but in 1770, an Englishman having killed or wounded a Moor, Mohammed, the Emperor then reigning, declared that he would never suffer a European to reside there again. The roadstead is secure only with Westerly winds. (Chénier, iii. 19.) It is much frequented by provision-boats from Gibraltar, and often furnishes supplies to our fleets in the Mediterranean.

4. *Ceuta*, a Spanish corruption of Sibtah, or Sebta, the Arabian mode of expressing Septa, (i. e. enclosed,) is the name of a town which appears to have been first mentioned by Procopius in the VIth century. It is the African Pillar of Hercules, placed at the extremity of a peninsula at the foot of Abyla. Idrísí's etymology of the name, (iv. 1.) though ridiculous when referred to the Arabic Language, is very admissible when derived from the Latin; for a peninsula, all but surrounded by the sea, might justly be termed *Septa*. Procopius has, however, (*de Bello Vandalico*, lib. ii.) suggested a more probable derivation. He calls the place *Arx Septensis*, and seems to allude to the seven hills on which the ancient town or fortress was built. It is situated in 35° 54' 10" North and 5° 17' 25" West, and was taken from the Moors by the Portuguese in 1409 according to some authorities, in 1415 according to others. (Marmol, iv. 54. vol. ii. 128.) Having been annexed with the rest of the Portuguese

* Leo says only one eye; but *dwin* is a common termination of the plural number in the Berber Tongue, and Leo's interpretation seems to have been made to suit his story. The Latin translator, by forming a nominative from Leo's Tetteguin, (i. e. Tettéwin, the Moorish pronunciation of Tettáwin,) has produced a name which has scarcely any resemblance to Tetuan.

* This name is a strong evidence of the antiquity of the Berber or Akwál amázigh, (i. e. Language of Freeman,) for Rús-ádir signifies in that language mountain-head, and therefore promontory.

MO-
ROCCO.

dominions to the Crown of Spain in 1580, it was retained by the latter Power, on the reestablishment of the Portuguese Monarchy in 1640, and was finally ceded to Spain by the Treaty concluded in 1668. The strength of its fortifications is such as to render it almost impregnable on the land side; nor has it ever been taken by the Moors, though once blockaded under Múlái Ismá'il for twenty-six years (from 1694 to 1720) successively. It is built upon a narrow neck of land, stretching out from Mount El Mínah, on the point of which the citadel, almost surrounded by water, is placed. The adjoining city is an Episcopal See, containing a Cathedral, eight Churches, five Convents, three Hospitals, and about 8000 inhabitants. Its harbour is fit for small vessels only, and its territory does not extend beyond the reach of its guns. In modern times its citadel has been used as a State prison. Sebtah has been erroneously supposed to be the birth-place of the Arabian Geographer Idrísí.

Tangiers,
or Tanjar.

A bold and rugged shore, broken by promontories, separates Ceuta from 5. *Tangier*, (Tanjah, in 35° 47' 54" North and 5° 48' West,) which is one day's journey distant from Tetuan. It is situated in a fine position, fifty leagues North-West (Cierzo) of Fás, (Marmol, iv. 83.) and was strongly fortified by the Portuguese, by whom it was ceded to Great Britain in 1662 as a part of the marriage portion of Charles II.'s Queen. It was, however, abandoned in 1684, as not worth keeping, after the mole and fortifications had been destroyed. Situated at the bottom of a deep bay, on the sandy, unproductive soil of a valley, embosomed by high mountains, it has few, if any, resources in itself, but is said to have flourished greatly under the Arabs, till the capture of Azílá by the Portuguese in 1471, when the inhabitants of Tanjah, panic-struck, deserted the town, which was soon afterwards occupied by the Portuguese troops on the 28th of August in that year. (Marmol, ii. fol. 123.) It has little commerce, as the mouth of its river is now entirely obstructed by sand, and the roads in the neighbouring mountains are unfavourable to communication with the interior; but a constant intercourse is kept up with Gibraltar, the chief supplies of which, when England is at war with Spain, must be procured from Morocco. The present town rises abruptly from the beach, and overlooks a bay of about three miles in width. It is enclosed by mouldering walls, and defended by two batteries, "which would not stand fire," says Lieutenant Washington, (*Jour. of Geogr. Soc.* p. 123.) "for ten minutes." The Governor inhabits an old and extensive castle, (*El kasábah*), commanding the place on the North side. The Jáma' el kabír (great mosque) is rather a handsome building, and has a fine minaret, (vulgò *smà'*, probably for *asma'*, towering: the proper term is *saúma'ah*, a tower or turret,) "ornamented with tessellated work." There are some remains of the ancient Tingis, near the Southern side of the bay, and the modern town is now the residence of the European Consuls. The anchorage in the bay is pretty secure, except with strong North-West winds; and the population of the town may be estimated at upwards of 7000. It is governed by a Báshá, who resides there.

Arzilla.

6. *Azílá*, in 35° 29' 30" North and 6° West, is one very short day's journey distant from Tanjah, (Idrísí, iv. 1. *Geogr. Nub.* p. 150.) therefore not more than sixteen or eighteen miles. It is described by Idrísí as a very small town, containing nothing but a few beggars in extreme indigence. It was also, he adds, called Asílá, and is near the entrance of the canal called Alzakák, (*i. e.* the Straits of

Gibraltar.) It is said by Marmol (iv. 42.) to be seven leagues (twenty-one miles) to the West of the straits in the Province of El Habat, and it was very flourishing, he adds, when destroyed by an English fleet in 936. It was restored by 'Abdu-r-rahman, Khalif of Cordova, about 960, again became flourishing, and was soon a favourite rendezvous of Corsairs; in consequence of which it was taken by the Portuguese in 1471, but was abandoned by them in the middle of the XVIth century on account of the difficulty of approaching it, occasioned by a very extensive reef or sand-bank (*arrecifo*) off the entrance of its harbour. It is about a quarter of a mile square, still bears marks of having been occupied by the Portuguese, and may contain 1000 inhabitants. (Washington, p. 154.) It is supplied with water by wells, having no river near it, (Idrísí, *ubi supra*), notwithstanding which, one appears in Mr. Jackson's Map. (*Account of Timbuctoo*, &c.)

7. *El 'Aráish*, in 35° 12' 50" North and 6° 9' West, is called by the Berbers El 'Aráish Bení 'Arós (*i. e.* the Tents of the Children of 'Arús) according to Marmol, (iv. 40.) who says, in the words of Leo, (391.) that it stands on a point of land between the sea and the mouth of the Lukús, (or U'lkús,*) near which there is a castle built by Múlái Násir, who restored it in 1491, after it had been deserted in consequence of the capture of Azílá. It is surrounded by meadows and lagunes, abounding in eels and water birds. The banks of the river are thickly wooded, and much infested by lions and other wild beasts. The inhabitants were formerly engaged, for the most part, in making charcoal and cultivating cotton. Their harbour, which has water enough for small-craft only, is obstructed by a very dangerous bar at its mouth. In Marmol's time this place, together with Azílá and El kasr el kebír, (Alcazar,) formed a Government under the superintendence of a Káid, (*Alcayde*), who resided in the latter town. El 'Aráish, says Lieutenant Washington, (p. 153.) is situated on an abrupt declivity of sand-stone, on the Southern bank of the river U'lkús: its sea-defences are strong, and it is enclosed by a wall and ditch crowned with a citadel, having also a venerable castle at the entrance of the river. This town is now a picturesque ruin, and is fast falling into decay. Its population may amount to 4000. An inscription over the gate towards the sea records the restoration of the town to the Spaniards in 1610. It was retaken in 1689 by Múlái Ismá'il, who caused the fortifications to be strengthened; and it was bombarded by the French without much effect in 1765. Its harbour was either underrated by Marmol, or has been improved since his time. Within the bar, there is a fair port for frigates about three-quarters of a mile long by a quarter broad; on the bar, which runs from North by East to South by West, there are sixteen feet of water in spring-tides. Two brigs of war, of eighteen guns each, the whole of the Moorish Navy, were lying there in 1829, when an Austrian force attempted to burn them, and, "as is well known," says the same writer, "failed from gross igno-

MO-
ROCCO.Larache, or
Lharais.

* This name is an evident corruption of the ancient Lixus. The Moors, (probably Jews,) who told Mr. Washington that it is called El Kós, "the bow," from its winding course, must have been very ignorant or inattentive; as U'lkús, or Lukus, and El Kós, are differently spelt, and ought to be differently pronounced. El 'Aráish, moreover, signifies either tents or trellises, and may possibly be thence used for a flower-garden; but no such term is given in Dombay's *Vocabulary* annexed to his *Grammatica Linguae Mauro-Arabicae*.

MO-
ROCCO.

rance of seamanship and gunnery." Between El 'Aráish and El Ma'mórah the country is varied by lakes, forests, and valleys, formerly very populous; near the latter town there is a fresh-water lake, nearly twenty miles in extent, (called *El Merja*, i. e. the Asylum, in Mr. Jackson's Map,) navigated by boats made of rushes; and having hermitages and encampments of wandering Tribes on its banks. (Chénier, iii. 24.)

Maamore,
or Mah-
mora.

S. *El Ma'mórah*, (the Populous City,) in 34° 18' North and 6° 36' West, between forty and fifty miles South-West of El 'Aráish, was a small town in the time of Leo, (262.) one mile and a half from the sea, and twelve miles (four leagues, according to Marmol, iv. 16.) to the East of Salá. It was surrounded by sandy plains at the mouth of the River Sebú; (the ancient Subur;) to guard which it was built by Ya'kób El Mansór near the close of the XIIth century. A wood near it, much infested by lions, supplied the markets of Fás with large quantities of acorns (of the *Quercus ballota*) as large as damascenes and sweeter than chestnuts. It was destroyed, about A. D. 1480, in the Civil wars between Saíd and his uncle Abú Sa'ad. (Marmol, ii. fol. 80.) The Portuguese made an unsuccessful attempt to build a fort there in 1515; and Leo, who was an eye-witness, has given a full account of their disasters. (263.) This fort was restored to the Portuguese by the Spaniards in 1604, but taken from them by Múlái Ismá'il in 1681. It is now merely a refuge to thirty-five or forty families of labourers, who are maintained by the fishery of shad, and by ferrying passengers over the river; the mouth of which is much obstructed by sand, which has accumulated so much that the castle is now two miles from the beach. (Chénier, iii. 25.) El Ma'mórah is on the Northern confines of the Province of Bení Hasen, and belongs to the territories of Fás. It is now frequently called Mahdúmah (ruined) or Mehediyyah. The latter name is probably derived from the neighbouring sanctuary.

Sallee, Cele,
or Sela.Gueron
River.

Sixteen miles South South-West is (9.) the town of *Salá*, in 34° 18' North and 6° 36' West, in the Province of Bení Hasan. It is near the mouth of the River Burregreg, (Búrekrak?) *Salá*, or *Usmír*, as it is called by Idrísí, (*Cl.* ii. pt. i. p. 77.) after Mas'údí, and increased by the Werú at a short distance from *Salá*. There was formerly a considerable harbour at the mouth of the river, but the sands even when Idrísí wrote, in the middle of the XIIth century, had extended the shore two miles beyond Shálah, (the Sela of Leo, 258.) anciently near the beach. In consequence of this, *Salá el jedidah* (New *Salé*) had then been lately built at the mouth of the river on an eminence near the sea. It had an excellent harbour, much frequented by ships from Seville and different parts of Spain, but the mouth of the river was beset with rocks, and very dangerous. It was long the terror of Europe; and no Corsairs were more dreaded than the well-known "Sallee rovers;" but so rapid has been the accumulation of sand in its harbour, that fifty years ago ships of 200 tons burthen could not pass the bar without first discharging their cargo. (Chénier, iii. 24.) At neap tides the depth on the bar was only six feet in 1768. (Hæst, 87.) *Salá* was then the third commercial town in the Empire, and its inhabitants, estimated at 16,000, were, for the most part, Andalusís, (i. e. of Spanish origin,) though they called themselves Slávi. (*Saláwí*, i. e. natives of *Salá*.) It is now "ruined, still, and lifeless," (Washington, p. 129.) but tolerably well fortified for a Moorish town, and is still supposed to contain 10,000 inhabitants. The bar has only three or

four feet of water at low tides, with a channel at each end. Small ships from the Imperial dock-yards are launched when the mountain torrents in Spring force a passage over the bar.

On the other side of the river, about half a mile from the town, is (10.) *Rabát*, or *Mehediyyah*, in the Province of Támesnà, and Kingdom of Fás. It was built by the celebrated Ya'kób El Mansór towards the close of the XIIth century, as a summer residence, from which he could easily communicate with Spain, and issue commands to his armies there as well as in Morocco. Under his fostering patronage it soon became a large and flourishing city; and among the many monuments of his princely munificence was the famous tower (*Berj el hhasen*) at the Southern gate of the city, supposed to be the loftiest edifice in all Africa. It bears a strong resemblance to the tower of the Alkasábat (Palace) at Morocco, and to that of the great Church of Seville; (Marmol, iv. 5.) and the Africans say they were all made by one builder. But the ascent in the tower of Rabát is the widest, as three horsemen can mount it abreast: it is spiral, and not divided into steps, being a continued inclined plane, like the ascent to the galleries in the Mosque of Sta. Sophia in Constantinople. From the summit of the tower* a ship can be seen at a very great distance. The aqueduct by which fresh water was brought into the town (its wells and springs being all brackish) from a distance of twelve miles, was another noble monument of the liberality of El Mansór; but the utility of public works is no guarantee for their preservation among Barbarians; and as there is no right of primogeniture to regulate the succession of Mohammedan Princes, a Civil war almost invariably occurs on the demise of the Sultan: confusion ensues, and the successor is more anxious to obliterate than to perpetuate the good done by his predecessor. Thus Rabát, which had, as it were by the magic spell of El Mansór, almost instantaneously risen to opulence and splendour, as rapidly sank into decay when his support was withdrawn. The aqueduct was already a ruin, not a tenth of the city was remaining, scarcely 400 houses were occupied, only two or three districts near the castle were inhabited, and all the rest were converted into orchards and vineyards when Leo saw the place, scarcely three hundred years after the era of its foundation. The castle was held by a Káid and military force in the time of Marmol, (iv. 5.) and the plains to the East of the river, with all the fine pastures in the adjoining country, were abandoned to the Sháwiyahs, a Tribe of Berbers, from whom one of the modern Provinces of Morocco receives its name. Rabát, even in modern times, was once the residence of several European merchants, and is, from its central position, the best adapted to foreign commerce of any port on the coast, but the difficulties in the navigation of its river, and the arbitrary and capricious measures of the Government, finally drove all the foreign merchants from it. The Castle and Palace built by El Mansór were destroyed by Múlái Mohammed. One mile from Rabát, further inland, lies Shálah or Sálah, a small but very ancient city, much venerated by the Moors as being the burial place of the great El

* "Four men on horseback," says Marmol, (ii. fol. 76.) and soon afterwards "a ship at sea may be descried from its summit when more than twenty leagues distant." Did he repeat what he had heard himself, or indulge in a wish to improve upon Leo?

MO-
ROCCO.

Mansór and many of his successors. Leo says he copied thirty sepulchral inscriptions there in A. H. 915. (A. D. 1510.) This place is called Mençala (Manzálah?) by Marmol, (iv. 6.) and no Christian is allowed to enter it. Roman coins, said to have been found there, were shown to Mr. Washington, (130.) who has given a picturesque description of the present appearance of Rabát, not forgetting the Esma'hhasan, (or Beautiful Tower,) which he says is 150 feet high. Its population he estimates at 21,000, which is probably too high.

Anafe.
Darebbeide.

11. On the coast, about forty miles South-West of Rabát, is *Anfá*, commonly called *Dár-el-baïdá*,* (i. e. White House,) in 33° 36' 30" North and 7° 40' West, in a plain of about eighty miles in diameter, in the Province of Támesnà, abutting on its North side upon the sea, and placed in a very fertile tract, and one of the finest situations in Africa; (Leo, 243.) but the piracies of its cruisers soon provoked the hostility of the Portuguese, and it was deserted by its inhabitants and entirely ruined by a Portuguese fleet in 1468. (Marmol, ii. fol. 75.) "The weakness and errors of the Kings of Fés," says Leo, (245.) "have come to such a pitch, that all hope of the restoration of this place has vanished." *Anfá*, according to Idrísí, (p. 78.) is forty miles from Fedálah, fifty-two miles from Salá, and sixty-five miles coasting round the bay, but only thirty across it, from Mazaghan. In 1515 the Portuguese made an ineffectual attempt to build a fort there, and the place appears to have lain in ruins ever since. Its name *Anfá*, according to Mr. Jackson, (p. 103.) signifies in the Berber Language anise-seed, which is peculiarly abundant there; and its rich plains are now left, he says, uncultivated, because the prohibition to export grain has rendered the cultivation of them useless. Marmol (iv. 2.) informs us that this place is called Absa by some Arabs.

Azamor.
River Uma-
rabea, or
Morbeye.

12. Forty-two miles South-West of Dár-el-baïdá, near the mouth of the River Umm-er-rabí', is the town of *Azamór*, in 33° 17' 37" North and 8° 15' West. It is mentioned by Abú'l Fedá, who calls it (p. 4.) *Azammór*; and though not noticed under that name by Idrísí, it is probably the town of Umm Rabí'† described by him. The river here divides Támesnà from Dukkálah, and Azamór, on its South-Western side, is in the latter Province. It flourished greatly in the latter part of the XVth century, and carried on a considerable trade in fish, (barbels according to Leo, 192.) shad and bonitos (*Scomber pelamis*) according to Marmol, (ii. fol. 52.) which brought in a yearly revenue of 6000 or 7000 ducats (about £1200.) It was much frequented by Portuguese merchants, who having informed their King of its wealth and pointed out the facility with which it might be taken, Don João de Meneses, Captain-General of Azilá, was ordered in 1506 to attack it; but he failed through the treachery of Múlái Zeïdán, a Moorish Prince, who accompanied him, and from the valour with which its inhabitants defended themselves. In 1510, however, a treaty offensive and defensive was concluded

with the King of Portugal for twenty years, by which the town was bound to pay him an annual tribute of 10,000 shads. (*sábalos*.) But the treaty was soon violated by Múlái Zeïdán, so that in 1513, James Duke of Braganza (Bregança and Vergança) was sent with a fleet of 400 sail, great and small, and a proportionate number of troops, to reduce the rebels. The inhabitants at first defended themselves gallantly, but having lost their leader, Sídí Mansór, and being panic-struck by the magnitude of the force opposed to them, they precipitately fled from the city, and left the Portuguese to take possession of it without any further contest. The difficulty occasioned by the bar at the mouth of the river, and the annoyance from Sheríf Adshamed, King of Morocco, who occupied a hill which commands the town, rendered the place more expensive than profitable, so that in 1541 the King of Portugal determined to abandon it. This town being a mile and a half from the mouth of the river is not well placed for commercial purposes, and has now fallen into decay. Its population is not estimated at more than 3000. Its walls are a mile and a half in circuit, but its streets are dull and lifeless.

Eleven or twelve miles South-West of Azamór is Mazaghan. (13.) *Mazaghan*, placed on a small peninsula in 33° 14' North and 8° 21' West. *Mazighan* (as it is spelt by Idrísí, iii. i. p. 78.) was built by the King of Portugal, says Marmol, (iii. 56.) on a level piece of land near the sea where there stood an ancient tower called by the Africans Boreïjah, (i. e. Little Tower.) It was anciently the Port of El Medinah (a town long since ruined.) Its fortifications were much strengthened after the abandonment of Safi and Azamór. It was continually assaulted by the Moors, and the Portuguese performed wonders in its defence. It was begun in 1506, (Chénier, iii. 34.) and called by them *Castello Real*, but at length abandoned in 1769, when besieged by Málái Mohammed. The Tower, whence the Moors call it Berïjah, (more properly Boreïjah,) is still standing at a little distance to the South-West. It has also a fine reservoir and other remains which do honour to the Portuguese architects; and as its roadstead is tolerable, it still enjoys some commerce, and is supposed to have 2000 inhabitants. About three miles to the South-West are some ruins on the beach called Tét, or Títe, supposed to be on the site of a Roman city. It was for a time subject to Portugal, but its inhabitants were removed by Múlái Násir, brother of Mohammed Wattás, King of Fás, to a town in the neighbourhood of that Capital, and it has ever since been in ruins.

At about thirty-six miles South-West of Mazaghan is Waledea, or (14.) *Waládiyyah*, in 33° 48' North and 8° 48' West, possessed of an ample basin entirely enclosed by rocks, but having a very narrow entrance entirely exposed to the West. The sea appears to have receded here, and left a spacious plain uncovered. (Chénier, iii. 36.) The town is quite modern, and was built by El Walíd ibn Zeïdán, who reigned from 1634 to 1646. It is principally inhabited by Jews, and is celebrated for its oysters. About twelve miles South-West of Mazaghan is Cabo Blanco, a bold rocky promontory, in 33° 8' North and 8° 40' West; and nearly half-way between El-Waládiyyah and Asafí, is Cape Cantín, called Rás-el-hudík by the Arabs, in 32° 35' North and 9° 13' 20" West.

Thirty-six miles South-West of Waládiyyah is (15.) *Asfí*, or *Asafí*, in 32° 18' 15" North and 9° 12' West. It is now considered as belonging to the district of 'Abdah, Asfee. a portion of Dukkálah occupied principally by an Arab

Tribe bearing that name. (Marmol, iii. 52.) Asfi is described by Leo, (180.) and more fully by Marmol, (iii. 53.) as a very ancient city on the sea-coast at the Westernmost extremity of the Province of Dukkálah, enclosed by strong walls 1327 yards in circuit, with 87 towers. On the Western side there is a castle on a slight elevation, overlooking a small bay insecure from its many rocks and sheltered only from the North wind. The population consists of 4000 houses. (*casas*.) This place was given up to the Portuguese in 1508, and abandoned by them in 1541. The surrounding country is very fertile, but little cultivated, and much frequented by European merchants, even after it was abandoned to the Moors on account of the many Jews settled there. It lies in a narrow valley between two hills which render it intolerably hot in Summer, and deluge it with torrents in Winter. Having been blessed with the residence of many Saints, no Jew is allowed to enter it except barefooted; and its suburb, Rabát, a few gun-shots distant on the road to Sawírah, (Mogodor,) is an asylum for all sorts of malefactors, debtors, &c., being under the protection of Mohammed Sálíhheh, a Saint of the first magnitude; and every Jew must doff his slippers even when passing by the shrine of Múlá Abd-er-rahmán, whose bones are deposited on the other side of the town, though he be much inferior in odour of sanctity to Sálíhheh. Fifteen miles South-West of Asafi is the mouth of the Tensift, one of the largest rivers in the Empire. In Summer it is fordable on horseback; but in Winter it is crossed on rafts formed of reeds and made buoyant by inflated goat-skins.

Tensift.

Mogodor.
Saura.

About fifty miles South-West of that river is (16.) *Mogodor*, or *Sawírah*, nearly the last town which Europeans frequent on this coast. It is placed in $31^{\circ} 30' 30''$ North and $9^{\circ} 44'$ West, and is of a very modern date. The Emperor Sídí Mohammed, who succeeded his brother 'Abd-Allah in 1757, being desirous of founding a new city, fixed on a spot where a castle, built by the Portuguese, protected the entrance of a roadstead formed by a small island a few gun-shots distant from the main land. Orders were immediately issued inviting, or rather commanding, his Majesty's liege subjects, and all foreign Consuls and agents, on pain of being treated as enemies, forthwith to build a large house of stone and mortar, and transfer their residence to this new sea-port. A command the less agreeable, as the site of Mogodor is a low, flat desert of accumulating sand, protected towards the sea by a ridge of rocks, but on every other side so low as almost to be insulated at high tides. "The adjoining country," says Chénier, "is dreary; nothing is seen but accumulated sands and wild desert tracts, calculated only to raise feelings of desolateness and disgust." The new town was to be as beautiful as a painting, (*sawírah*), and therefore a French engineer, named Corant, who, in a luckless hour, had gone to seek his fortune in Morocco, was employed to draw a plan which the inhabitants were obliged to follow. Its streets are all at right angles, but narrow and gloomy. Externally it has a handsome appearance, as the houses are all of white stone; but internally their want of windows towards the street, gives them a dull, lifeless appearance. It was begun in 1760, and called Sawírah for the reason assigned above; though it is more frequently named Mogodor from the adjoining Tomb of a Saint styled Sídí Mogodúl, or Mogodór. Among other recommendations of its site, is a total want of fresh water; there being none nearer than a river a mile and

VOL. XXV.

a half distant; and Sídí Mohammed, though he provided his new city with walls and a Mosque, (Hæst, 74.) never thought of emulating his great predecessor Al Mansór by building an aqueduct. As the boisterous winds, almost always prevalent in Summer, keep the sands in perpetual motion, there is no possibility of making gardens near the town, and garden-stuff, as well as every other kind of provision, must be procured from places several miles distant. (Jackson, 108.) The harbour has only ten or twelve feet depth of water when the tide ebbs, so that large ships cannot anchor in it. The fortifications, though not very well planned, are sufficient, if properly manned with expert artillerymen to make a considerable resistance.

The last harbour in the dominions of Morocco is (17.) *Agádír*. (Akádír?) or *Santa Cruz*, (Holy Cross,) nearly in $30^{\circ} 35'$ North and $9^{\circ} 40'$ West, a little to the South-East of Cabo de Aguer, (*i. e.* Cape Agér,) which is in $30^{\circ} 38'$ North and $9^{\circ} 51' 36''$ West, according to Borda's observations. The origin of this town was a wooden castle built on the coast by a Portuguese engaged in the ling fishery, (*bacallao*, *Gadus Morrhua*), who called it Santa Cruz, while the Arabs named it Dár Rúmiyyah. (Roman House.) It was soon afterwards purchased by Emanuel, King of Portugal, (who reigned from 1495 to 1521,) and converted into a strongly fortified town at first called Cape Agir. (Marmol, iii. 26.) The Portuguese lost it in 1536; but it was a place of considerable trade, and there were several European commercial houses there when its inhabitants were all transferred, in 1774, by order of Sídí Mohammed to Mogodor. The town is strongly placed on the summit of a hill, has a fine spring of fresh water near the sea, and an excellent harbour; "probably," says Mr. Jackson, (114.) "the best road for vessels in the Empire; being large and well defended on every side from all winds." Tálib Sálíhh, the Governor in 1773, refused to deliver it up to the Emperor's officers, on which the latter marched against it and soon reduced the rebels. It was in consequence of this rebellion, according to the writer last-named, that he ordered it to be dismantled, and transferred its principal inhabitants to Mogodor. Agádír is the last port on this coast frequented by Europeans. Though the Empire of Morocco extends beyond Atlas as far as Cape Nún, (in $28^{\circ} 41'$ North and $11^{\circ} 15' 18''$ West,) the Emperor's authority in that remote part of his dominions is little more than nominal. Between Agádír and Cape Bojador, in $26^{\circ} 7' 6''$ North and $14^{\circ} 31' 30''$ West, there are only two roadsteads in which ships can anchor, and the coast, towards which there are strong currents, is beset with sunken rocks and shallows. This interval, therefore, of 150 Geographical miles is that which is most to be avoided by navigators, as those who are wrecked upon these truly inhospitable shores have nothing to expect but the most cruel and inhuman treatment; for the Great Desert, which here separates Morocco from the Bilád-es-súdán, (*i. e.* Nigritia,) is peopled only by brutal and rapacious Savages, who seem to observe none but the worst tenets of the Religion they profess. Mr. Jackson, in 1794, visited the Seb'ah bíár (Seven Wells) and Másah (Mesah) at the mouth of the river Sús, the boundary of the Province, for the purpose of ascertaining the possibility of forming a commercial establishment at either of those places. His report is not encouraging; and where all property is held by so uncertain a tenure as among these lawless and needy Berbers, neither the security

Terodant.

nor the profit requisite to make Commerce advantageous are likely to be obtained.

(18.) *Tárúdan* is still, as formerly, considered as the Capital of Sús in the remotest West. (Sús-el-aksà.) The extreme fertility of this Province and the excellence of its manufactures are celebrated by Idrísí,* (iv. 1.) and the country round its Capital is still called by the Moors an earthly Paradise. (Hæst. 71.) Of its present state the accounts are rather contradictory, but all agree in saying that it is much reduced, and now only remarkable for its excellent saltpetre.

Dra, Draha.

To the West of *Tárúdan*, and according to Mr. Jackson's Map, separated from it by a chain of hills, is the Province of (19.) *Dar'ah*, on the confines of the Desert. "It takes its name," says Marmol, (vii. 9.) "from a large river which passes through it, having risen in the Greater Atlas, on the confines of *Heskúrah*; and, running Southward towards the sands of Libya, (i. e. the *Sahrà*, or Great Desert,) forms several large lakes round which the Arabs (*Alardies*) of the Desert feed their camels. In length it extends ninety leagues from the mountains of Atlas to the desert of the *Sanhájahs*; (*los Zenegas*;) but it is very narrow as almost all the inhabitants dwell on the banks of that river, which increases in Winter, but is fordable on foot in many places in Summer, and when the heat is very great its waters are bitter. It begins to rise in April, and on its increase the produce of the year depends. Idrísí says, expressly, that this river comes from *Sijilmásah*; it is therefore the *Zíz*. There are many towns and castles in this territory, but they are ill-built, and their only timber is palm-wood which has little durability; their dates, however, are the finest in the world. The palms being male and female, (of which the females alone produce fruit, the males nothing but flowers,) in order that the fruit may be good, it is necessary before the flower of the female opens to take a small branch of the flower of the male and insert it (*enrerirlo*) in the other. The greatest trade is in those places which are on the road from Fés to Tumbuto. There is in this Country much endico, (indigo,) which is a certain colour like woad, (*el gnado*; *Isatis tinctoria*;) and the merchants of Fés and other cities of Barbary take much of it in truck (*a trueco*) for other merchandise. Bread-corn and horses are scarce; there are a few goats fattened on pounded date-stones; and ostriches are reared in flocks, as geese are in Castille,† for food, but their flesh, especially that of their legs, is very hard, ill-savoured, and clammy. Their women are handsome and not very coy; and as the *Dar'awis* are fond of their Negresses, *Mestizos* are very common, and the greater part of the people are *Mulattos*." "The Province of *Dar'ah*," adds the same author, "is bounded on the West by *Gezúlah* and *Sús*; on the East by *Sugulmésah*, (*Sijilmásah*;) on the South by the *Sanhájahs* and Desert of Libya, (the *Sahrà*;) and on the North by that part of the Greater Atlas which overlooks the Kingdom and Province of Morocco. It was formerly divided into two Governments, one that of *Timeskit* (i. e. the *Mesjid*, or Mosque) in the Upper; the other that of *Tinzulin* in the Lower Country. At the latter many horse and musketeers on foot were stationed to keep the Province

in subjection, and defend the inhabitants against attacks by Arabs of the Desert called *Uled Celém*, (*Aúlád Selám*;) a rich people, who go every year to trade in the Land of the Negroes, in the Kingdom of Tumbuto, and possess more than 3000 horses, and a great number of camels. The most considerable of these Arabs, to whom the people of *Dar'ah* used to pay tribute, are those called *Uled Hamran*, (*Aúlád Hhamrán*;) a *Kobeilah* of the *Aúlád Mansór*, and of the town (*pueblo*) of *Mahquil*, (*Ma'kil*?) who have many *aduars*, (*al dawwars*, i. e. encampments,) a great number of footmen, (*peones*;) and more than 3000 horses. In Winter they remain in the Desert; and in Spring they go rambling over Numidia, (*Bilád-el-jeríd*;) as far as the Province of *Garet* (*Káret*) in the Kingdom of Fés." (Fás.) Several towns in this Province are also described by Marmol, who seems to have been better acquainted with it than Leo.

(20.) Three days' journey (between sixty and seventy miles) to the East of *Dar'ah*, and on the same river, is *Sijilmásah*, (Idrísí, iii. 1. p. 75.) a large and populous city in a rich country on the banks of a deep river coming from the Eastern Desert and overflowing like the Nile in Summer. It sometimes makes the land so fertile that fresh crops spring up without being sown. After commending its various productions, Idrísí adds, that it had suffered much in the wars carried on by the heretics (*mukhálifín*) in his days, and concludes by saying, that the people of *Sijilmásah* eat dogs and lizards, that their women are extremely fat, and that most of them are afflicted with ophthalmia. The river passing through *Sijilmásah* is, as we learn from Leo (740.) and Marmol, (i. 12.) the *Zíz*,* which rises in that part of the Greater Atlas which is inhabited by the *Sanhájahs*, and running Southward between very high mountains passes close by *Gars-el-win* in the Kingdom of Fás, and then through the States of *Kenánah*, (*Quenena*;) or *Kheneg*, (*Cheneg*, in Leo,) *Matakárah*, (*Madghárah*;) and *Rethel*, (*Retel*;) and enters within the limits of the City of *Sijilmásah*. (*Sugulmessa*.) It afterwards flows through the palm groves to the Deserts of *Sahrà*, (*Zahara*;) passing close by a town (villa) called *Suka'ilah*, (*Sugayhila*;) or *Quayhila*, (*Essuoihila*, Leo, 612.) and running Southward, forms a large lake (*lago*) in the midst of the sands where there are no inhabitants. This Country, (*Sijilmásah*;) which is more than forty-one leagues across, is peopled by Berbers called *Zenátahs*, (*Zenetes*;) *Sanhájahs*, (*Zanhayias*;) or *Hawárahs*. (*Haoras*;) They rebelled against the *Bení Meríní* Sultáns of Morocco, in consequence of which their Country was completely laid waste. In Marmol's time they had in part recovered from those calamities and had three fortified towns besides the Capital; but were always divided by feuds and Civil broils. While independent, they had a Mint of their own; but the receipts at their Custom-house (*aduana*) were paid to the powerful Arab Tribes of *Aúlád Hhusein* and *Aúlád Abú-Hhasan*, who extended their courses so far as the City of *Gars-el-win*, and had more than 6000 horse and 50,000 foot. The people of *Sijilmásah* were in general very poor, except a few who were enriched by trading between Barbary and the Land of the Negroes, bringing back gold and slaves in exchange for the merchandise they carried out. In this

ROCCO.Sigilmessa,
Segel-
messa,
Sugulmessa.

* This passage has been omitted in the Epitome, and is consequently not found in the *Geographia Nubiensis*, p. 75.

† Here Marmol seems to have improved a little upon his text in Leo. (605.)

* But the testimony of Idrísí and Abú-l-fedá militates against this statement; both of them say that the river on which *Sijilmásah* stands comes from the Desert to the South-East, and passes on to *Dar'ah*; but as *Rathel* is East of *Sijilmásah*, and the *Zíz* traverses that country, the two accounts are not irreconcilable.

MO-
ROCCO.

Country there is an abundance of scorpions but no fleas; and the heat is so excessive that the people have always swollen eyes. Whenever the river fails, they are much distressed for water, as that of their wells is brackish. Sijilmásah has Dar'ah to the West; Rethel, or Arratámah, (Retel o Arratama, *i. e.* *Retama*; *Spartium monospermum*, African broom,) on its own River Zíz, to the East; Sua'ilah, (Çuayhila,) a fortified place in the Sahrá (Libya) to the South; and that part of the Greater Atlas, which is immediately above Gars-el-win to the North. The City of Sijilmásah was completely deserted and ruined in the times of Leo and Marmol, though there were still large remains of the Palaces, Mosques, Colleges, Fountains, &c. with which it had been formerly adorned. Its existence in 1353 is attested by Ibn Bâtútá, (p. 231.) who says it is one of the finest of cities, and compares it to Basrah; the great height of its level is also incidentally shown by his complaining (242.) of the cold and snow there on his return from Nigritia. Abú-l-fedá, who flourished at the same time, places the City of Sijilmásah in either 31° 30' or 36° 34' North and 20° 8' or 18° 34' East, (of the Fortunate Islands,) therefore, taking Ferro as the first meridian, in 7° 36' or 9° 10' West of Greenwich. The discordance of these data shows how little reliance they can claim; but the distances given furnish better means for ascertaining the position of Sijilmásah; and from them it seems not improbable that it has been in modern times replaced by Táfilált, (Tafilet, or Tafilét,) a name which appears for the first time in Marmol, (ii. 40. vol. i. fol. 248.) where he records its seizure by the Sherífs, about A. D. 1530; for the route of Ahmed ibn Hhasen from Fás to Táfilét, (Walckenaer, *Recherches*, p. 457.) passes through the same districts as are found, according to Leo, (606.) between Fás and Sijilmásah; both follow the course of the Zíz, and Ahmed reaches Rethel at the distance of a short day's journey from Táfilált. Now Rethel, in Leo, is the district adjoining to that of Sijilmásah, the territory of which extended from the denile of Gars-el-win (Gers of Ahmed, p. 461.) in Mount Atlas, along the course of the Zíz, to the borders of the Desert. (Leo, 605, 606.) Its Provinces were El Kheneg, (erroneously read Eltching in Walckenaer, p. 461.) Madghárah, (Matagara, in Marmol, vii. 25.) Rethel, and Sijilmásah.

Tafilet.

(21.) *Táfilált*, moreover, is described by Ahmed as a Province not as a city: it is therefore not improbable that the Kingdom of Táfilált, the Country of the Filálís, (Fil-léli,) is the territory of Sijilmásah described by the older writers, extending from North to South 120 miles. The former is indeed described by Marmol (vii. 28.) as a very large city in the State of Numidia, (Bilád el jeríd,) on a sandy plain, walled, and having an *alcaçaba* (Al-kasábah, *i. e.* the Citadel) on one side of the city, in which there are more than 2000 inhabitants. It is peopled by Berbers called Filelis, (Filálís,*) a rich and industrious people, famous for their manufacture of rich targets (*adargas*) of camels' hides, for their beautiful striped cloths, fine carpets, (*althombras*), cloaks, (*al quiceles*), and bornúses. A great trade is carried on there in hides and indigo. (*anib*.) It is on the confines of Zaara, (the Sahrá, or

* Tá-filál-t might, according to the idiom of the Berber Language, signify a female Filáli; but that form seems also to express "abode," "assemblage," "community:" thus Tebuhaqant (Tá-Bú-Hhasan-t, Marmol, vii. 22.) is plainly the *place* or *abode* of Abú Hhasan, one of the Arab Tribes to whom these Berbers paid a tribute.

Great Desert,) and between it and the city of Fez there is a passage by which the greater chain of mountains is crossed. They used to be much molested by the Arabs of the Sahrá, called U'lád Celem, (Salám,) U'lád 'Abdu l-karím, and Sorkán; (Zorgan;) but Sheikh 'Amar of the second of those Tribes, who governed it in our days, continues Marmol, was obliged to yield to the arms of Múlái Ahmed, Sheríf and King of Morocco, (about A. D. 1530.) It is, according to Mr. Jackson, eight days' journey on horseback (*rit hálat dhá-l'aúd*) from the Palace of Pharaoh, (Ukser Fir'aún,) North-East of Mequinez; (Mikrásah;) but his account of the river passing by Táfilált is in direct contradiction not only to the routes given above, but also to his own Map. He mentions indeed another river which flows in the opposite direction, and may be the Zíz; but the whole of his account betrays the incorrectness of the information which he received.

Retracing the route across Mount Atlas we are brought to (22.) *Miknásah*, the Capital of one of the many Kingdoms which the Sherífs have succeeded in uniting under their sole dominion. According to the observations of Don Diego de la Badía, (the *soi-disant* 'Alí Beg el 'Abbási,) that city is in 33° 58' 30" North and 5° 30' West. It is situated in a beautiful valley, surrounded by gentle eminences in the midst of a very fertile country. "The (principal) city of Miknásah," says Idrisi, (*C. iii. part i.* in the unpublished part of his Work,) "is called Tákdert, and it is a beautiful city, to the East of which there runs a small stream which turns some mills, and has houses, gardens, and corn-fields on its banks. Its soil is productive of grain, and many profitable trades and manufactures are carried on by its inhabitants. It took its name from Miknás, the Berber, who settled here with his children when they wandered into the West. (*El Maghrib*.) He divided the land among his sons, giving each of them a portion in which he might live with his children, and all these portions were contiguous. The district of Miknásah was known by the name of Bení Ziyád. It has a populous city with markets much frequented, baths, fine houses, and water running through its streets; and in the days of Al Mulaththem (*i. e.* under the Morábitum, or Almoravides, in the XIth and XIIth centuries) there was no district after Tákderts more populous than that of the Bení Ziyád. These districts were about a quarter of a mile asunder, and at the same distance from the Bení Táwerah, whose city likewise was much frequented, populous, and well supplied with water. Between Táwerah and Bení Ziyáh there were two small towns on the road from Tákdert to El Súk-el-kadímah, (the Old Market,) at the distance of two bow-shots. The latter was built by one of the Almorábit Princes, who made it his place of abode. The former town, to the East of this, is named after the Bení 'Atúsh. It consists of contiguous houses, and habitations in gardens; and is abundantly supplied with fruits, vegetables, corn, &c. Below these places there is a Kobeilah of Miknásah on the stream which comes from Bení 'Atúsh, called Bení Bornús; they have dwellings and houses in the midst of olive-yards, vineyards, and corn-fields. To the North of them is Kasr Abí Músá, (the Castle of Abú Músá,) where there is held every Thursday a market much frequented by the Tribes (*kabáíl*) of the Bení Miknás. People come to it from far and near, and it is called El Súk-el-Kadímah." After enumerating the Tribes inhabiting this tract, he

Mekinez.

MO-
ROCCO.

adds, that its soil is the best and most productive possible; and that its inhabitants are genuine Berbers. Leo (267.) says it is a large city, named from the people who built it, about thirty-six miles from Fás, fifty from Salá, and fifteen from Mount Atlas, and contains 6000 houses, (about 30,000 inhabitants.) Its gardens extend three miles round the town. It is famous for its quinces, pomegranates, plums, and jujubes. Peaches and apricots are so abundant that they are thrown away; but olives are the great production of the place,* and a kantár (quintal; 120 lbs.) sold for a ducat and a half, (about 8s.) The city had then (early in the XVIth century) many very fine Mosques, three Colleges, and ten large Baths, and its territory was supposed to pay one-third of the whole revenue of the State. It had a very strong wall, broad streets well supplied with water brought by an aqueduct from a place three miles distant, but unpaved and very dirty in Winter. Its inhabitants were hospitable, but ignorant and clownish, very jealous of their wives, and inveterate, without knowing why, against the people of Fás. It was greatly enlarged and ornamented by Múlái Ismá'il, who made it his Northern, and Morocco his Southern Capital. Windus, who saw it in 1721, six years before his death, describes it (p. 183.) as "situated in a delightful plain, having a very serene and clear air. In the middle of the city live the Jews, having a place (called *millah*) to themselves, the gates of which are locked at night. They have an Alcayde to guard their gates and protect them against the common people, who otherwise would plunder them. Close to Mequinez, on the North-Western side, only divided by a road, stands a large Negro town, which takes up as much ground as the city; but the houses are not so high nor well built. The Palace stands on the South of the city, and was built entirely by this Emperor: it is looked after by several black eunuchs, the lustiest persons I ever saw, cleanly dress'd; their knives and cimitars are covered with wrought silver. In this Palace live the Emperor's four wives, who are the Queen of the Xeriphs, (*Sherífs*), the Queen of the Old Palace, and the two Queens of the Cobah 'l hodrah, (*Kobbah el khodrá*, i. e. the Green Pavilion,) and they say 2000 women more." It occupies a nearly square area of about four miles in circumference, on level ground, not overlooked by any neighbouring height. The whole building, except the pillars and arches, is formed of clay or mortar worked into a strong cement.† The outer wall is twenty-five feet in thickness. Internally it is divided into spacious courts, much larger than Lincoln's Inn Fields, and either paved with checkered squares of marble or laid out as gardens, and watered by numerous canals and fountains. *Kobbahs*, or alcoves, crowned with cupolas, and richly painted and gilt within, are thickly scattered throughout the Palace. The apartments are usually 25 feet long, 12 in width, and 18 in height, lined with glazed tiles brilliantly coloured, but lighted only, says Mr. Jackson, (127.) "by two large folding-doors." The women, says the same traveller, are handsome without exception, have a rare suavity of manners, and what is most extraordinary in latitude 34°, "a fair complexion." About thirty miles West North-West of Miknásah

* It is peculiarly called *Miknásatu-z zeítún*, i. e. Olive Miknásah.
† Probably what the Moors call *tabi'ah*, i. e. a strong cement made of lime and sand, beat down very hard in wooden moulds. The Spaniards, who call it *tapia*, have borrowed the Art and its name from the Arabs.

(Mequinez) is (23.) *Fás*, (Fez,*) in 34° 6' North and 4° 58' 15" East. In Leo's earlier years it was one of the most flourishing and splendid Capitals in Africa. His detailed and instructive account of its 650 Mosques, 200 Schools, numerous Colleges, Hospitals, Fondaks, (caravanserais,) mills, and richly supplied Kaïsariyyeh, (Bezestein,)—the mere enumeration of which is sufficient to give a very favourable idea of the resources and condition of the Country under its earlier dynasties,—was no longer applicable in his own and Marmol's days: and the Civil commotions which occurred in the greater part of the XVIth, as well as the brutal and degrading tyranny by which the Moors were oppressed in the following century, have since that period rapidly accelerated the decay of every thing useful or ornamental. The position of Fás is very picturesque; at the bottom of a deep valley, surrounded by gentle declivities, covered with thickly shaded gardens, and traversed by a river winding through it: the stranger has long to descend through these delightful groves before he reaches the city at the bottom of the valley, where he looks round upon a scene the most picturesque and striking. (Chénier, iii. 67.) This abundance of water and shade with a constant interchange of hill and dale, which would be delightful in any climate, is peculiarly so in one in which the heat in Summer is so great; and in former times the declivities of the vale of Fás were covered with country-houses, whither the wealthier inhabitants retired when the business of the day was over: but when Chénier saw the place about sixty years ago, few of these agreeable retreats had been restored. The present city is the union of three distinct towns, of which the first, called Buleidah, (i. e. the Little Town,) was begun by Múlái Idrís, the second Sultán of the first dynasty, in A. H. 191, (A. D. 807,) on the South-East side of the river, in the district called El Andalus; the second, on the North-West side, in the district of El Karuwiyyín, was founded by the same Prince, (Dombay, 47.) almost at the same time; these two were formed into one city by Yúsuf ibn Táshifín, who (A. H. 462, A. D. 1070) threw down the intervening walls and built bridges over the river. (Leo, 276. Dombay, 222.) The town, thus augmented, has borne the name of Fás bálí (Old Fez) ever since a third town (Fás el jedíd, New Fez) was built by Ya'kób ibn 'Abd-al-hakk, the first Meríní Sultán, (A. D. 1251—1286,) in the XIIIth century. The old town, the centre of which, lying completely in the bottom of the valley, is very dirty in Winter, and very unhealthy in Summer. The new town, which is on more level and elevated ground, has a drier and more healthy air. It contains several old Palaces inhabited by the Princes of the reigning family, and some good houses, but it is principally peopled by Jews, who are not allowed to live in the old city on account of its reputed sanctity. Both, though much decayed, retain many relics of their former splendour. In the latter the Muristán, or Mad-house, still remains; and there are nearly two hundred fondaks, some of them containing from fifty to one hundred apartments, each supplied with water, an accommodation peculiarly valuable in that climate. The Bázárs and Kaïsariyyeh are

* Fez, according to the orthography of the Spaniards, from whom the word has been adopted by other European nations, exactly represents the sound given by the Moors to the Arabic word *Fás*, as they generally pronounce their long *a* as in the English word *face*.

still occupied by the different trades to which their subdivisions are assigned. The manufactures introduced chiefly by the fugitives from Spain, still exist, and the scarlet woollen scull-caps, called Sháshiyeh by the Moors, but Fás by the Turks and Asiatics, are still made in the place from which they received their name. Red and yellow morocco leather, formerly called *corduan*, or *cordovan*, from Cordova, where the Musulmáns discovered the method of preparing it, gauzes, silks, and embroidered scarfs (*hhazám*) still issue from the looms and workshops of Fez. The old Castle (El Kasábah) to the West of the new town is the residence of the Káid, its Governor; and near it is a modern Palace built by Múlái Abd-allah, great-grandfather of Suleimán, the reigning Emperor. Rás-el-má, the source of the Wádí-l-jewáhir, (Jewel River,) which runs through Fás, is in a valley on the left side of the road to Miknásah. About three cubic feet of water issue from a rock eight or ten feet above the ground; and as the stream has so short a course above the town, it is never swollen by the rains so as to overflow its banks. There is an excellent road from Fez to Mequinez over a level and well-watered country, between rising grounds, which under a provident Government would produce rich harvests, but are here left uncultivated. Relays of mules are always ready on this road, so that in Summer it is possible to go from one place to the other twice in the same day; "a convenience not to be found," says M. Chénier, (iii. 71.) "in many well-governed Countries." At the Western extremity of the plain of Fez, and in sight of Mequinez,* he adds, is Mount Zarhón, on which is the village containing the Sanctuary of Múlái Idrís, the first Fátimite Sovereign of the West. Mount Zarhón extends from the Plain of Esaís, ten miles from Fás, thirty miles Westward, and, though in places very rugged, it is covered with olive trees. Its inhabitants were anciently famous for hunting lions. (Leo, 379, 380.) The town now called Záwiyah Múlái Idrís, (the Shrine of the Lord Idrís,) but anciently named Walíli, was the residence of that revered Prince the great-grandson of the Imam Hosein, son of 'Alí and grandson of Mohammed. There also he was entombed; no place, therefore, in all Africa is so sacred to the Shi'ites or adherents of 'Alí, nor is there any so much visited by pilgrims. No Christian, of course, would be allowed to come within its holy walls; and Windus, when accompanying the English Ambassador to Mequinez in 1721, was "encamped in the plain called Mulay Idris, from a Saint who has a monument hard by;" (p. 85;) he did not enter "the city that takes its name from the said Saint, which stands close under the high mountain Zarhon, which they say runs as far as the great Mountain Atlas." But he saw, what is more interesting to European travellers, "upon a gentle rising hill almost a league from this city, the remains of some ruins of a very ancient and noble building, which the Moors call Cassar Pharaon, (*Kasr Far'aun*), i. e. Pharaoh's Castle," or as Leo (382.) more properly renders it, Pharaoh's Palace. "These ruins," he continues, (p. 87.) "stand about sixteen miles North-East of Mequinez. The building (of which he has given a plate) seems to be part of a triumphal arch, there being several broken stones that bear inscriptions lying in the rubbish underneath, which were fixed higher than any part now standing. It is fifty-six feet long and

sixteen thick, both sides exactly alike, built with very hard stone, about a yard in length, and half a yard thick. About one hundred yards from the arch, stands good part of the front of a large square building, one hundred and forty foot long, and about sixty high: part of the four corners are yet standing, but very little remains except those of the front. Round the hill may be seen the foundation of a wall, about two miles in circumference, which enclosed these buildings, on the outside of which lie scattered all over a great many stones, of the same size the arch is built with, but hardly left one upon another, excepting at an arch which stood about half a mile from the other buildings, seemed to have been a gateway, and was just high enough to admit a man to pass through on horseback." The wall which he calls the front, was ornamented with a double row of Corinthian pilasters, one over the other: and the whole style of architecture, as well as the inscriptions, show that it was a Roman building, perhaps of the Age of Constantine the Great. According to Leo, (382.) these ruins are the walls of an ancient town.

(24.) The City of Morocco, called by the Moors *Mará-kesh*,* in 31° 37' 40" North† and 7° 36' West, is the Capital of the Empire as well as of the Kingdom of Morocco before its union with Fás and the other Moorish States. It is placed on a very beautiful site, fifteen or twenty miles North of the highest chain of Mount Atlas. It is more modern than Fás, having been begun by Yúsuf ibn Tashifin, A. H. 454. (A. D. 1062.) Like all the other cities in the Empire, it has suffered an almost entire dilapidation from the internal strife or grinding oppression which have so long desolated West Barbary. "More than 6000 streams, descending from Mount Atlas, diffused coolness and fertility," says M. Chénier, (iii. 49.) "over the gardens and plantations with which the plain around the city was formerly adorned. But this valuable property was laid waste in the struggles which preceded and continued during the reign of Muléy Ismaél; nothing but the wreck of its former beauty remains; and in 1768, scarcely 1200 of the streams which meander through this fertile tract, had been restored to their channels. The City of Morocco itself, exposed to the devastations of several conquerors, and successively pillaged and ravaged, has preserved only its external form. Its walls, which are still nearly entire, enclose a space which may have admitted a population of 100,000 souls; but its interior is now nothing more than an uninhabited desert. The ruins of houses heaped upon each other are, as it were, so many ramparts, behind which the rabble may secrete themselves for the purpose of surprising and plundering unguarded passengers. The inhabited quarters are remote from each other, and the houses low, dirty, and incommensurable. It is difficult to conceive how an Imperial city can be so desolate and wretched, and I doubt whether it contains 30,000 inhabitants even when the Court is there." It was the favourite residence of Múlái Mohammed, who sat on the throne for more than thirty years: how far his partiality has led to the improvements of his Capital, will appear from the report of a recent observer, a summary of whose remarks will enable the reader to form a fair

Morocco,
Meraksh,
Marocco.

* Between twelve and thirteen miles as appears from Windus. (p. 89.)

* According to Marmol (iii. 40.) the Africans, i. e. the Berbers, call it Marróksh, of which the Arabian Mará-kesh is perhaps a corruption. The Spaniards anciently named it Marrócos, as is manifest from Marrueces, their present mode of spelling the word.

† According to Mr. Washington's Map; but 31° 37' 20" in his text. (p. 141.)

MO-
ROCCO.

estimate of its present condition. "The City of Morocco," says Lieut. Washington, (p. 135.) who visited it with the British Mission in 1830, "lies on the Northern side of a rich plain, and is surrounded by a strongly built wall thirty feet high, with square towers about every fifty paces, and eleven double gates: the whole being nearly six miles in circuit.* But this vast area comprises large gardens and open spaces from twenty to thirty acres in extent. The Sultan's Palace, facing Mount Atlas, is not within the walls, but itself forms a fortress of equal strength, about 1500 yards long by 600 wide. There are nineteen Mosques, two Madrasahs, (Colleges,) and one Hospital. The principal, El Kutbiyyah,† is conspicuous from its lofty sóma'ah, or minaret, called Esmá'el fanár, (Lantern-tower,) from a turret in the shape of a lantern on its summit. It is, like all such towers in Barbary, quadrangular, and of the same diameter throughout, has seven stories, and measures 220 feet in perpendicular height." It is of this tower that Leo says (151.) the ascent is, like that at Rabát, without steps. According to Marmol, (iii. 20.) the mosque in the Kasábat (citadel) is that which was adorned with the gates of the great Church at Seville. The Mausoleum (and therefore Sanctuary) and Hospital of Abú-l'Abbás, (Belabes,) the patron Saint of the place, are deserving of notice. The Hospital is said to receive 1500 patients; but this is probably an exaggeration. In the Medrasah dhá-l meshiyyah, another College and Mosque, are the Sepulchres of the Sa'idiyyah Sultans, who being Shí'ahs, had them adorned with sculptures, since obliterated by their more orthodox successors. The Báb-er-róm (Roman gate) is a fine specimen of Moorish architecture; and some of the fountains are handsome, but the streets are, for the most part, narrow, winding lanes. The Kaïsariyyah, or Bezestein, "is a long range of shops, or rather stalls, covered in from the weather." The Millah, or Jewish quarter, is about a mile and a half in circuit in the South-East angle of the city; it is populous, but excessively filthy. The whole population probably does not exceed 80,000, says Mr. Washington; (138.) but Høst, who was a more experienced observer, and resided a whole year in Morocco, thinks 20,000 almost too much; and, allowing for a considerable increase of numbers since his time, they can hardly be supposed to have quadrupled. "Nothing flourishes," says the English traveller, "but vegetation, which even in the months of December and January is ripe and luxuriant; its springing freshness forming a striking contrast to the mouldering walls around." The British Mission was lodged in the Sebt-el-Mámóniyyah, covering an extent of fifteen acres, planted with every variety of fruit and shady tree, and affording uninterruptedly "silence, shade, verdure, and fragrance;" all most desirable in that

* Høst says, (75.) "I rode completely round it at a foot's pace (*im schritt*) in somewhat less than an hour;" it can hardly therefore be more than four miles in circuit.

† Mr. Washington spells it "El Koutubía." (p. 136.) It is also called the Masjid-el Kátibín, (writer's mosque,) of which he is speaking. Marmol (ii. fol. 32.) accounts for its name; he also describes the silver apples by which it is surmounted. Høst's vignette in his Title-page represents a similar lantern, which crowns the "isma" of the Mosque in the Kasábat.

Country even in the depth of Winter. From their terraced roof they had abundant opportunities of estimating the height of Atlas, and found its lofty peaks to measure only 11,400 feet above the sea, rather more than one-third of the elevation assigned to them, in consequence of calculations derived from the vague and inadmissible conjectures of Mr. Jackson. (*Marocco*, 10. *Shabeeny*, 93.)

To the authorities given for Barbary may be added the Epitome of Idrísí's *Geography*, Rome, 1592, 8vo.; Supplements, from the complete Work (No. 884. 887. in Uri's Catalogue of the Eastern MSS. in the Bodleian Library;) *Geographia Nubiensis*, Paris, 1619, 8vo.; Abulfeda, *Africa*, Gottingæ, 1791, 12mo.; Joannis Leonis Africani *De Africa Descriptione*, Ludg. Bat. 1632, 12mo.; Johann Leo, *Beschreibung von Africa aus dem Italienischen uebersetzt*, von G. W. Lorsbach, Herborn, 1805, 8vo.; Luys del Marmol, *Caravajal, Descripcion general de Affrica*, 2 vols. fol. Granada, 1573, (containing books i.—vi.) 3d vol. Malaga, 1599, (books vii.—xi.) Kosegarten, *De Mohammede Ebn Batuta*, Jena, 1818, 4to.; *The Travels of Ibn Batuta*, by Professor Lee, Lond. 1829, 4to.; Høst, *Nachrichten von Maròkos und Fes*, Kopenhagen, 1781, 4to.; *Relation de la Captivité du Sieur Mouette dans les Royaumes de Fes et de Maroc*, Paris, 1683, 12mo.; Windus, *Journey to Mequinez in the Year 1721*, Lond. 1725, 8vo. James Grey Jackson's *Account of Timbuctoo and Housa*, Lond. 1820, 8vo., contains a repetition of all the original matter in his Account of the Empire of Morocco. The gross errors which disgrace these volumes show how little the Author's accuracy can be trusted; and it is somewhat amusing to find a writer, who cannot spell the commonest words correctly, (see Months, p. 371, 372,) proposing in his advertisement to publish the first "accurate Grammar of the Arabic Language." The best account of the colloquial dialect is to be found in Dombay's *Grammatica Linguae Mauro-Arabicæ*, Vindobonæ, 1800, 4to.; and Vocabularies of the Berber language are given by Høst, Shaw, Lyon, (the *Ertánah* of Sokná,) Pacho, Von Minutoli, (*Verzeichniss von Wörtern der Siwahsprache*, Berlin, 1827;) Jezreel Jones, (*Dissertatio de Linguâ Shilhensi*,) in Chamberlayn's *Oratio Dominica*, (Amstel. 1715;) Venture, with Grammatical remarks, in Langlés' *Translation of Hornemann's Travels*, Par. 1803; and Hodgson on the *Berber Language*, in the *American Philosophical Transactions*, vol. iv. Dombay, *Geschichte der Mauritanischer Könige*, (Agram, 1794 and 1795, 8vo.) is the most authentic Work on the first three Dynasties, &c.: his *Geschichte der Scherifen*, (Agram, 1801,) gives the best account of the reigning Family, but the interval between 1325 and 1564 yet remains to be filled up. It is much to be regretted that he was not encouraged to complete his Work. Lieutenant Washington's *Geographical Notice of the Empire of Morocco*, in the *Journal of the Royal Geographical Society* for 1830, 1831, adds very considerably to our knowledge of that Country, and is accompanied by an excellent Map. Schousboc's *Beobachtungen über das Gewächsreich in Marocco*, (Leipzig, 1800, 8vo.) contain excellent remarks on the plants of that Country.

The forementioned cattle finding themselves disappointed will be
sure to go grumbling and grunting away, and not fail to proclaim
him a *morose*, ill-conditioned, ill-natured person in all clubs and
companies whatsoever.

South. Sermons, vol. vi. p. 105.

He [Mr. Hobbs] spent too much time in thinking, and too little
in exercising those thoughts in the company of other men of the
same, or of as good faculties; for want whereof his natural consti-
tution, with age, contracted such a *morosity*, that doubting and
contradicting men were never grateful to him.

Wood. Athenæ Oxonienses, vol. ii. fol. 643.

His learning produced not a *morose* self-complacency, but a
lovely affability, and a desire to teach others the glad tidings of joy.
Horne. Works, vol. iv. p. 484. *Discourse* 26.

Many, in all ages, have followed St. John into the wilderness, and
chosen retirement, not out of any *moroseness* of temper, or misan-
thropy, but that they might give themselves, without let or molesta-
tion, to the pursuit of divine knowledge.

Id. Ib. vol. vi. p. 284. *On the Life and Death of St. John the*
Baptist.

MORPETH, a Borough and Market Town in the
County of Northumberland, neatly built and pleasantly
situated among woody undulating hills. Camden states
that it was burned down in 1215 by its own inhabitants,
out of hatred against King John. It is described by
Leland as "a long town, metely well buylded with low
howses, the stretes pavyd. It is a far fayrer towne then
Alenwike. Morpeth Castle standeth by Morpeth town.
It is set on a high hill, and about the hill is moche
wood." A part of the gateway and a fragment of wall
are the sole present remains of the Castle. Morpeth has
returned two Members to Parliament since the year 1553.
It was destroyed by fire in 1689. The Public buildings
are a County Gaol, and a Town-house designed by Sir
John Vanbrugh. The Church, a Rectory, stands on
the Kirk Hill on the opposite bank of the river Wens-
beck, about a quarter of a mile without the town, and
its Belfry is in the Market Place. At the Bridge end is
a Chapel, and adjoining it one of Edward VI.'s Free-
schools kept in an ancient Chantry.

New Minster Abbey, "pleasaunt with water and very
fayre wood about it," stood on the Wensbeck about a
quarter of a mile from the town. Its revenues were
considerable, but a shattered doorway is all that now
testifies its former existence. Population, in 1821,

3415. Distant 15 miles N. from Newcastle, 292 from
London.

MO'RPHEW, v. } Low Lat. *morphea*; Fr. *mor-*
Mo'RPHEW, n. } *phée*; It. *morfea*; from *morbus*,
morbeus, morbea, morvea, morfea. Menage, who calls it
A kind of scab, or scabbiness.

Whose hand-leese bonnet vailes his o'ergrown chin
And sullen rags bewray his *morphew'd* skin?

Hall. Satire 5. book iv.

Let the glasse of the law be brought once and set before us we
shall then see the shamefull wrinkles, and foule *morphews* of our
soules. *Id. Works*, vol. ii. fol. 408. *The Fall of Pride*.

The root of capers is singular good to take away the white spotted
morphew, (*vitilego*.) *Holland. Plinie*, book xx. ch. xv.

MORRIS, } Fr. *moresque*; It. *moresca*; Sp.
MORI'SCO. } *morisco*. Sir Thomas More writes
Morish pikes: since called *morris*.

And see **DANCING**, p. 548.

And the one or two of those wretches would stand behynd those
morish pikes and draw the pore sowles by the members towarde
them.

Sir Thomas More. Workes, fol. 258. *A Dialogue concerning*
Heresies.

You see before they are married, what *moriscoes*,
What masques, and mummeries they put upon us
To be ty'd here, and suffer their Lavalto's?

Beaumont and Fletcher. The Wild Goose Chase, act v. sc. 2.

Which the French men perceiving, they entered the gallies again
with *morris-pikes* and began a new fight.

Baker. Henry VIII. Anno 1514.

There is a master of scoffing; that in his catalogue of books, of
a faigned library, sets downe the title of a booke, *The morris daunce*
of Heretikes. *Bacon. Essay* 3. p. 12.

And, like a *morrice-dancer* dress'd with bells,
Only to serve for noise, and nothing else.

Butler. Upon Human Learning, part ii.

MORROW. See **MORN**.

MORSE, Fr. *marsouin*, is a sea hog, *marinus*, or
maris sus; and *morse*, a sea-horse, may have the same
origin.

Briefly, that which is commonly received, and whereof there be
so many fragments preserved in England; is not only no horn,
but a substance harder then a bone, that is, the tooth of a *morse* or
sea-horse?

Sir Thomas Brown. Vulgar Errors, book iii. ch. xxiii. p. 204.

For that which is commonly called a sea-horse, is properly called a
morse, and makes not out that shape.

Id. Ib. book iii. ch. xxiv. p. 207.

MO'RSEL, } Fr. *morcel, morceau, morsure*; from
MO'RSURE. } the Lat. *morsus*, past participle of *mor-*
dere, to bite.

A bite, as much as is bitten: a small part, piece, or
portion.

Mosset he dude in hys mouþ, ac þe kýng ýt blessed er.

Spenser. Faerie Queene, book i. can. 5.

I knew her own subjects, the citizens of London, would not lend her Majesty money without lands in mortgage.

The Trial of Sir Walter Raleigh, fol. 261.

But mortuum vadium, a dead pledge, mortgage, (which is much more common than the other,) it is when a man borrows of another a specific sum, (e. g. 200*l.*) and grants him an estate in fee, on condition that if he, the mortgagor, shall repay the mortgagee the said sum of 200*l.* on a certain day mentioned in the deed, that then the mortgagor may reenter on the estate so granted in pledge.

Blackstone. Commentaries, book ii. ch. x.

When this resource is exhausted, and it becomes necessary, in order to raise money, to assign or mortgage some particular branch of the public revenue for the payment of the debt, government has upon different occasions done this in two different ways. Sometimes it has made this assignment or mortgage for a short period of time only, a year, or a few years, for example; and sometimes for perpetuity.

Smith. Wealth of Nations, book v. ch. iii. vol. iii. p. 404.

MORTGAGE, in Law, may be defined to be a pledge of land or other real property as a security for the payment of money. It is most frequently used for the purpose of securing to a lender repayment of the money lent. It is effected by means of a deed, by which the borrower, or other person, who is to receive the money, conveys the land, intended to be pledged, to the lender or other person who is to pay the money. The person who conveys the land is called the *Mortgagor*, and the person, to whom it is conveyed, is called the *Mortgagee*. The conveyance is not made absolutely as in the case of a purchase; but a clause is inserted in the deed to the effect that, if the money, with such interest as may be agreed on, be repaid on a day fixed, then the land shall be restored to the Mortgagor. This clause in the deed is called the *proviso for redemption*. According to the ancient strictness of Law, if the Mortgagor permitted the day, fixed in the proviso, to elapse without paying or tendering the Mortgage money, he forfeited all his right to the land Mortgaged, which consequently became absolutely and indefeasibly vested in the Mortgagee; and this rule still prevails so far, that in the Courts of Law, as distinguished from the Courts of Equity, the Mortgagee is still considered the legal owner of the estate, and is entitled in that character to exercise all the rights which the legal ownership of an estate usually confers. The hardship of this doctrine required the interference of the Courts of Equity, which it first obtained either in the reign of James I. or in the latter part of that of Elizabeth. The doctrine which has been established in the Courts of Equity is that a Mortgage though forfeited at Law, and though the Mortgagee be in possession of the land, continues redeemable so long as the relation of debtor and creditor appears to subsist between the parties, and for twenty years after the last acknowledgment of that relation by the Mortgagee;

MORT-
GAGE.

which period was selected from the consideration, that in other cases a title was obtained under the Statutes of Limitation from twenty years' undisturbed possession; and it cannot be said that there is any hardship upon a Mortgagor in holding, that, if he suffers so long a period to elapse without exercising his right, he shall be presumed either never to have had a right or to have abandoned it. This right of redeeming the land Mortgaged, after the forfeiture is complete at Law, is called the Mortgagor's *Equity of Redemption*. The equity of redemption is considered as an equitable estate, resembling the legal estate in most particulars: it descends to the same heir as the legal estate would have descended to; it may be devised by will; it may be sold, or Mortgaged; it may be entailed, and the entail can only be barred by a common recovery or fine; it is subject to the courtesy of the husband, but, by an unmeaning and somewhat ungallant exception, it is not subject to the dower of the wife; it is liable to Crown debts, and may be sold under an extent out of the Court of Exchequer, but it is not liable to be taken in execution to satisfy a debt due to a subject; the latter, however, having obtained a judgment, may, by applying to the Courts of Equity, obtain a decree to be permitted to pay off the Mortgage, and then the land Mortgaged will stand as a security in the hands of the creditor not only for the Mortgage money which he has paid off but also for the debt for which the judgment was obtained. If the Mortgagor Mortgage his equity of redemption, he will still have an equity of redemption remaining in him, which in every respect resembles the original equity of redemption, and may be Mortgaged over and over again, so long as the value of the estate subject to the prior Mortgages be sufficient to induce capitalists to advance their money upon the security. When the party entitled to redeem wishes to exercise that right, he must pay off the principal, the interest, and the costs. If the Mortgagee resist, the Mortgagor must file his bill in the Courts of Equity, which is called a *Bill for Redemption*; which upon proof of the right to redeem, will decree that the Mortgagee shall reconvey the land. The Mortgagee is only entitled to the land so far as to make it available as a security; if, therefore, he is let into possession of the rents or profits, he must apply them, so far as they will go, in satisfaction of his debt. He has generally three modes of enforcing payment. 1. He may bring an action for the debt. 2. He may take possession of the Mortgaged land for the purpose of paying himself out of the rents and profits. An action of ejectment is the mode of acquiring such possession, if it cannot be obtained without legal process. If the land was in lease prior to the Mortgage, he has no greater right to remove the tenants, than the Mortgagor had, under whom he claims; he may, however, forbid the tenants to pay their rents to the Mortgagor, and after such notice he will be entitled to receive the rents himself. If any tenants have been let into possession without his consent after the Mortgage, he may proceed to eject them without giving any notice to quit, or if he prefer it, he may require them to pay their rents to himself. 3. He may *foreclose*. "The usual course pursued on *foreclosure* is, for the Mortgagee to file his bill, praying that an account may be taken of principal and interest, and that the Defendant may be decreed to pay the same with costs by a short day to be appointed by the Court, and in default thereof, he may be foreclosed his equity of redemption. On the answer coming in,

the matter is referred to one of the Masters to take the account, and a decree is made for payment of principal, interest, and costs within six calendar months after the Master shall have made his report. After the account has been taken, the Master makes his report, and appoints a day of payment; the report is confirmed, and, on default made, the Mortgagee may obtain an absolute order for foreclosing: the order is afterwards signed and enrolled, and the foreclosure is complete." Coote on *Mortgage*, p. 511. In some cases, as when the party entitled to redeem is an infant, the Court will order a sale rather than a foreclosure, in order that if the sale produce more than sufficient to pay off the Mortgage, the infant may have the benefit of the surplus. Under very special circumstances, when the justice of the case clearly requires it, the Courts will allow a redemption, though a decree of foreclosure has been already signed and enrolled. In one case for instance, where it appeared that the estate was far more valuable than the Mortgage, and that the Mortgagor had been in very embarrassed circumstances, the decree of foreclosure was, what is technically called, opened after a period of sixteen years. The Mortgagee is sometimes, by way of additional security, empowered under the Mortgage deed to sell the land and to repay himself out of the Mortgage money. When this is the case he may proceed to sell under the power without any previous application to the Courts of Equity.

It has been already said, that the Mortgagor is liable to an Action at Law at the suit of the Mortgagee, for the purpose of enforcing payment of the debt. So also are his executors or administrators to the extent of their assets, *i. e.* the property which devolves upon them in their representative character. A purchaser of the equity of redemption is not personally liable to the mortgagee; if, however, he expressly contracts, as one of the conditions of the purchase, that he will pay the debt, he is liable to be sued by the Mortgagor. After a Mortgagor's death where the equity of redemption has either descended to his heir, or passed under his will to a devisee, the Courts of Equity will, unless there be a special reason to the contrary, direct that the debt shall be paid out of his personal estate in discharge of the equity of redemption. If there is a clear intention appearing on the face of the will, that the debt should be paid out of the land and not out of the personal estate, this will be such a reason, and the Courts of Equity will give effect to that intention: for, if the Mortgagee compels the executor to pay the debt out of the personal estate, the Court will let the executor stand in the place of the Mortgagee, so that though the Mortgagee is paid off, the equity of redemption will still remain charged with the debt for the benefit of the personal estate.

If the Mortgagee assign the Mortgage, the money must be paid to the assignee. If the original or the substituted Mortgagee die, it must be paid to his personal representative and not to his heir. For though the legal estate of the land Mortgaged, descend to the heir, if the Mortgage be in fee, still the Courts of Equity look upon the money secured as the principal thing; and as that money would have formed part of the personal estate, they hold that the debt shall do so in like manner, and that the heir to whom the land descends shall only hold it as trustee for the executor. If the Mortgage were for a term of years and not in fee, it vests at once in the executor, and the heir does not even take a trust estate as in the preceding instance.

MORT-
GAGE.

MORT-
GAGE.
—
MORT-
MAIN.

When the same land has been Mortgaged to several individuals, the general rule is, that they shall be paid off according to the priority of their Mortgages; there are, however, some exceptions to this rule. When the land is not sufficient to pay all, the right of priority is of course very important. If the first Mortgagee has neglected to have the legal estate properly vested in himself, a second Mortgagee, who lends his money without notice of the first, and does procure the legal estate, is entitled to the priority. So also if the Mortgagor fraudulently effects a second Mortgage, and the first Mortgagee assists him in perpetrating the fraud: and if the first Mortgagee needlessly leave the title-deeds in the possession of the Mortgagor, this will be strong grounds for treating him as an accessory, for without the deeds the Mortgagor could not have deceived the second Mortgagee. If the first Mortgagee advance more money on the security of the land, without notice that the equity of redemption has been Mortgaged to a second Mortgagee in the interim, he may tack his second to his first advance, and by so doing may shut out the second Mortgagee. So also, if a person who supposed that he stood second, find that in point of fact he stands third, he may, if he can, pay off the first Mortgagee, and take an assignment of the Mortgage, by which means he will be enabled to tack his own claim to the original Mortgage, to the exclusion of the second Mortgagee.

A Welch Mortgage is where it is stipulated between the parties that the Mortgagee shall take possession of the land and pay himself out of the rents and profits. This differs in no respect from the case of a common Mortgage where the Mortgagee is in possession, except that the land is the only security for the debt, and the Mortgagor has no right to redeem by tendering the money. Another species of Welch Mortgage is where the Mortgagee is to take the rents and profits by way of interest, the Mortgagor remaining liable for the principal only.

MORTISE, *v.* } Fr. *mortaise*. Foramen quo coar-
MORTISE, *n.* } ticularitur et coaptantur ligna in
ædificiis; the hole, or bore, by which beams are jointed and fitted or fastened together, Skinner. Menage derives from *mordere*, to bite.

A mortised lock is a lock let or placed in a hole cut into the wood to receive and hold it.

It is a massie wheele
Fixt on the sommet of the highest mount,
To whose huge spoakes, ten thousand lesser things
Are mortiz'd and adioyn'd.

Shakspeare. *Hamlet*, fol. 269.

If it hath ruffian'd so vpon the sea
What ribbes of oake, when mountaines melt on them,
Can hold the morties.

Id. *Othello*, fol. 316.

That so the other end of the beam sinking upon the hinder pile of fraills, and pressing them, may make way for the putting in the wedges into the great mortise, and discharge the wedge in the little mortise, which, whilst they were placing the fraills upon the pedestals, supported the beam.

Locke. *Works*, vol. iv. p. 659. *Observations upon Olives*.

MORTMAIN. Fr. *mort-maine*; in *mortuâ manu*, a dead hand. Coke, in his *1st Institute*, conjectures various reasons for the appellation. See the Quotation from Blackstone.

And this statute is not made onelye for the aduantage of the temporall lordes agaynst y^e cleargie, but it is made indifferentlye agaynst all mortmayn.

Sir Thomas More. *Workes*, fol. 333. *The Supplication of Soules*.

What liberall revenues, rich maintenances were then put into [mort-maine] the dead hand of the Church.

Hall. *Works*, vol. i. fol. 418. *The Impresse of God*, part ii.

All purchases made by corporate bodies being said to be purchases in mortmain, in *mortuâ manu*; for the reason of which appellation Sir Edward Coke offers many conjectures; but there is one which seems more probable than any that he has given us: viz. that these purchases being usually made by ecclesiastical bodies, the members of which (being professed) were reckoned dead persons in law, land therefore, holden by them, might with great propriety be said to be held in *mortua manu*.

Blackstone. *Commentaries*, book i. ch. xviii.

MORTMAIN, in Law. The alienation of any lands or tenements to any Corporation, sole or aggregate, ecclesiastical or temporal, is called an alienation in Mortmain, a term probably meaning originally, that the lands so aliened were held by a *dead* or unprofitable hand; for as a Corporation could neither die nor marry, it followed that when a Corporation became the owner of any lands, the Lord, of whom the lands were holden, was entirely deprived of all wardships, marriages, reliefs, escheats, &c. which constituted the usual profits of tenure. This being a hardship on the Lords, various Statutes, beginning with *Magna Charta*, and called the *Statutes of Mortmain*, were passed, prohibiting such alienations under pain of forfeiture to the Lord himself, which was thought the most reasonable penalty, as the Lord was the person whose interests would be injured by the alienation. No forfeiture, however, was incurred if the alienation were made with the consent of the Lord. If the lands were held immediately of the King, his consent alone was sufficient; but if there were any intermediate or mesne Lords, it was necessary to procure the consent of all of them as well as that of the King. In the course of time the mesne Lordships or Seigniories became few in number, and the interests of the Lords in such as were known to exist were almost entirely extinguished by the final abolition of military tenures in the reign of Charles II. Whereupon, by Stat. 7 and 8 William III. the consent of the mesne Lords was dispensed with, and a license from the Crown was rendered by itself sufficient; upon which footing the Law remains at the present day.

The Statutes of Mortmain were principally directed against the avarice of the Clergy, who in the Dark Ages were frequently able to procure grants of land, by working on the fears or superstitions of the wealthy; and numerous were the shifts and contrivances to which the Clergy had recourse for the purpose of defeating the object of the Statutes. The penalty being forfeiture to the Lord, they procured grants of the lands of which they themselves were Lords; in which case there could either be no forfeiture, or only a forfeiture to themselves. Alienations for an estate of freehold only being prohibited, they took leases for long terms of years. Those alienations only being prohibited which were actually made to a Corporation, they procured the land to be conveyed to an individual, to be held however by him to the use of themselves; and the Lord Chancellor, who was usually an ecclesiastic, used to hold that the individual was bound in conscience to let them take the profits of the lands, as he accepted the conveyance, not for his own, but for their use. And lastly, as alienations only were prohibited, they instituted fictitious suits for the land against the persons who were willing to endow them, which persons suffered judgment by default; by which means the land did not pass by alienation, but was recovered by the judgment of a Court of Law. No sooner, however, was a new mode of evasion devised

MORT-
MAIN.

MORT-
MAIN.
—
MOR-
TUARY.

by the Clergy, than a new remedy was applied by the Legislature, which at length gained a complete victory; but the effects of the contest are still visible in our times in the shape of *uses and trusts, and common recoveries*.

By Stat. 9 George II. c. 36. it was enacted, that all conveyances for *any charitable uses*, whether made to a Corporation or to an individual, should be void unless made by deed indented, sealed, and delivered in the presence of two or more credible witnesses twelve months at least before the death of the donor, (including the days of execution and death,) and be enrolled in the Court of Chancery within six calendar months after the execution thereof; and unless the same be made to take effect in possession, for the charitable use intended immediately from the making thereof, and be without any power of revocation, reservation, trust, condition, limitation, clause, or agreement whatsoever, for the benefit of the donor, or of any one claiming under him. The Colleges of Eton, Westminster, and Winchester, (for the benefit of the scholars only,) and the British Museum, are exempted from the operation of this Act. The above Statute extends to personal property, money, and stocks in the Public Funds, if the same are to be invested in lands, or in any interest arising out of lands; and it is provided, that if the conveyance be of stock, it must be transferred more than six months before the death of the grantor. See Bacon, *Abridgement*, title *Charitable Uses and Mortmain*; Blackstone, *Commentaries*, vol. ii. p. 268. *et seq.*

MORT-PAY, *i. e.* "taking or receiving of the King's Highnesse (*pay* or) wages for more souldiers then served, or for mo' dayes then they served," being dead or discharged.

This parliament was merely a parliament of warre; for it was in substance but a declaration of warre against France and Scotland, with some statutes conducing thereunto; as the severe punishing of *mort-payes*, and keeping backe of souldiours wages in captains.
Bacon. King Henry VII. fol. 101.

MORTUARY, (see MORTAL,) in *Law*, is a gift which, by the custom of many parishes, is due to the Minister upon the death of one of the parishioners. It was anciently usual to bring the Mortuary to the church (FUNERAL RITES, p. 390) with the corpse; whence it took the name of *corse-present*, a name which shows that the payment of the Mortuary was once voluntary, though, so early as in the reign of Henry III., we find that the custom was established. The Mortuary was given by way of compensation for the tithes and offerings which the deceased had failed to pay in his life-time, and for the salvation of his soul. In the reign of Henry VIII. the custom was found to be the cause of great exactions on the part of the Clergy and of expensive litigation; accordingly the Statute 21 Henry VIII. c. 6. was passed, by which it is enacted, that Mortuaries shall be taken in the following manner, unless where less or none is due by the custom: *viz.* for every person who does not leave goods to the value of ten marks, nothing; for every person who leaves goods to the value of ten marks and under thirty pounds, 3s. 4d.; if above thirty and under forty pounds, 6s. 8d.; if above forty pounds, of what value soever the goods may be, 10s., and no more. It is enacted further, that no Mortuary shall be paid on the death of a married woman; nor for any child; nor for any one that is not a housekeeper; nor for any wayfaring man; but such wayfaring man's Mortuary shall be paid in the parish to which he belongs. This is the

Statute which regulates Mortuaries at the present day. See Blackstone, *Commentaries*, vol. ii. p. 424; Burn, *Ecclesiastical Law*, title *Mortuary*.

MORUS, in *Botany*, a genus of the class *Monoecia*, order *Tetrandria*, natural order *Urticæ*. Generic character: male flower, calyx four-cleft, segments ovate, concave; corolla none; stamens awl-shaped, spreading, longer than the calyx; anthers simple: female flower, calyx four-leaved, persisting; corolla none; germen superior, heart-shaped; styles two, awl-shaped, reflexed, the juicy coloured leaves of the calyx form the berry.

There are ten species of this genus known, they are trees, and some of their products highly valuable: the most remarkable are *M. nigra*, the common Mulberry-tree; it is a native of Persia. *M. alba* is the species generally cultivated in China and the South of Europe as food for silk-worms; *M. tinctoria*, the wood of which is the Fustic of commerce, producing a yellow dye.

MOSA'ICK, *adj.* } Fr. *mosaïque, mosaïque*; It. MOSA'ICK, *n.* } *mosaico, musaico*; Sp. *mosayaca*. MOSA'ICAL, } The Lat. *musivum* is used by MOSA'ICALLY. } Spartian, quoted by Menage in his *Dictionary*, and by Vossius, *de Vit.* c. xi. and those who executed *Mosaick* work were called *musivarii*. The Gr. *μοῦσα, μουσικόν*, were applied generally to express neatness, elegance, neatly or elegantly performed, fitted or adapted; and Scaliger infers that this kind of work was so called *a concinnitate et elegantia*. See *Musivum Opus*, in Du Cange, and MARQUETRY.

See the Quotation from Evelyn.

And behind the thickets again new beds of flowers which, being under the trees, the trees were to them a pavilion, and they to the trees a *mosaical* flower. *Sidney. Arcadia*, book i. p. 15.

Each beauteous flower,
Iris all hues, roses, and gessamin,
Rear'd high their flourisht heads between, and wrought
Mosaic. *Milton. Paradise Lost*, book iv. l. 700.
They (mix'd in workes) *mosaically* grow,
And yet each part doth every kinde bestow.
Stirling. Doomes-day. The twelfth Houre.

But where it is made of lesser stones, or rather morsels of them, assisted with small squares of thick glass, of which some are gilded or cemented in the stuc or plaster, it is called *mosaic* work, *opus musivum*.

The *Mosaic* law, as it was planned by unerring wisdom, was unquestionably admirably well contrived for the great purposes for which it was intended—to maintain the knowledge of the true God among a particular people, and to cherish an opinion of the necessity of an expiatory sacrifice for involuntary offences, till the season should arrive for the general revelation.

Horsley. *Sermon* 21. vol. ii. p. 185.

MOSCARIA, in *Botany*, a genus of the class *Syngenesia*, order *Æquales*. Generic character: calyx six-leaved, equal; receptacle flat, chaffy, exterior down of the seed plumose at the apex, central down naked.

One species, *M. pinnatifida*, native of Chili.

MOSCHUS, Lin.; *Musk*, Penn.; in *Zoology*, a genus of animals belonging to the family *Acornia*, order *Ruminantia*, class *Mammalia*.

Generic character. No incisive teeth in the upper, but eight in the lower jaw; in the upper jaw of the male two long cuspid teeth extending far beyond the lips, curved backwards, and either rounded or flattened on the outer surface; none in the female; molar six on each side in either jaw with tubercular crowns, the first in the upper, and the first two in the lower jaw, provided with cutting edges and points; nose long and narrow; tail short, in some little more than a tubercle.

The animals which form this genus are all natives of the East, and derive their name from the circumstance of one of them furnishing the perfume Musk, which is contained in a bag in the abdominal region. They are timid animals and extremely nimble. They differ remarkably in size; and from some peculiarities in their feet and teeth might perhaps be divided into sections.

M. Moschiferus, Lin.; *le Musc*, Buff.; *Thibet Musk*, Pen. About three feet three inches in length; two feet three to the top of the shoulder, two feet nine to the top of the haunch in height; the forehead slightly arched and rounded; chin straight; eyes large, with reddish-brown irides; edge of the eyelids and nose black; ears wide, erect, and very movable; hair thick and crisp, of various colours, but principally brown, yellow, and whitish, the latter at the roots, the two former towards the tip; the nose, forehead, outside of the ears reddish-black mingled with grey; dun-yellow above and below the eyes; shoulders, legs, and feet brownish-black; the hind limbs of the same colour, but lighter; sometimes a white spot on the forehead; tail a mere tubercle. In the male there is a pendulous bag, about the size of a hen's egg, situated on the belly, and furnished with two small apertures, one oblong the other round; the one naked, the other covered with long hairs; in this bag is contained the musk, which is of the consistence of fat, and of a brown colour. They inhabit the Kingdom of Thibet, the Province of Mohang Meng in China, Tonquin, and Bontan; also about the Lake Bachal, near the Rivers Jenesea and Argun. They are found between latitude 60° and 45°, but rarely descend so far South unless impelled by hunger, when they migrate to feed on the newly-grown rice and corn. They are naturally very shy, love solitude, and live on mountains most wild and difficult of access. They are hunted, an occupation of great danger, for the sake of their musk; the bag containing which the hunters cut off and tie up for sale. The animals must either be very numerous,

or the article very much adulterated, as Tavernier states that in a single journey he bought 7673 musk bags. The musk from Thibet is considered the most valuable, and is strongest during rutting-time.

M. Meminna, Erxl.; *le Chevrotain à peau marquée de taches blanches*, Buff.; *Meminna*, Knox. About seventeen inches long; the ears very long and the tail extremely short; the upper part of the body is olive-grey, marked with round white spots on the sides; belly white. It is found in Ceylon.

The other species also are small, and are all natives of Java; they have been described by Sir S. Raffles.

M. Javanicus, Raffles; *Napu Musk*. Is about twenty inches long and thirteen high, but is much higher behind than at the shoulder; the top of the head very flat, and of a mottled-ferruginous colour; a blackish line runs from the angle of the eye to the nose; a white stripe runs along the base of the lower jaw on each side to the angle, the interspace white, giving rise to three white stripes which run to the shoulders and breast; the back mottled-ferruginous; the sides grey, varied with white; the belly and insides of the thighs white; along a great part of the middle of the belly passes a grey stripe; the tail two or three inches long and white beneath. It is called *Napu* by the natives, is found among the thickets on the sea-shore, and feeds principally on the berries of a species of *Ardisia*; and if taken young, can be easily tamed.

M. Kanchil, Raffles; *Kanchil Musk*. About fifteen inches long and nine or ten high; in form it much resembles the preceding, but is of lighter make; the head is not so flat, and the muzzle is more curved; the general colour is a deep red-brown, inclining to black on the back and bright bay on the sides; the belly and insides of the legs white; from between the fore-legs to the middle of the belly a brown line passes; the white stripe on each side of the jaw is prolonged towards the shoulder, and becoming narrower as it passes back, the middle stripe is broadest below and narrow above, and never unites with the lateral; it has no black line from the eye to the nose, but there is a well-marked black line down the back of the neck; the tail nearly two inches long, white beneath and at the tip. The *Kanchil* is found in the depths of the forests, but cannot be tamed; it is swifter than the preceding, and is so alert and cunning, as to have given rise to the Malay proverb for a rogue, "as cunning as a *Kanchil*." When caught in the nooses laid for them they feign death, but the moment they are incautiously untied they start off and escape. It is said, that when pursued by dogs, the *Kanchil* will jump up and hook itself by its curved tusks on the branch of a tree till they have passed.

The only notice given by Sir S. Raffles of the

M. Pelandok is, that it is the least of the three Javan species in point of height, that it has a larger and heavier body, a larger eye, and is not so nimble as the *Kanchil*.

See Linnæi *Systema Naturæ* a Gmelin; Raffles, in *Linnæan Transactions*, vol. xiii.; Pennant, *History of Quadrupeds*.

MOS-
CHUS.

M O S C O W.

MOS-COW. MOSCOW is one of the fifty-one Governments into which Alexander, in 1822, divided the Russian Empire. It is bounded on the North-West by Twer, North-East by Wladimir, South-East by Riaisan, South by Tula and Kaluga, South-West by Smolensko; lies between 54° 40' and 56° 30' latitude, and between 35° 10' and 38° 40' East longitude; is 260 British miles in length, 160 in breadth, and contains 9954 square British miles of superficial extent. There are within these limits 1,337,900 inhabitants, and consequently 134 to each square mile. In estimating its importance relatively to the other Governments, we find it to hold the first rank as to population in proportion to its extent, and the first also as to the amount of capital, and the skill and industry of its artisans, the thirteenth as to the actual amount of its population, the forty-ninth as to its superficial extent. It is divided into thirteen Districts, named after their chief towns. The amount of circulating capital, according to the report of officers appointed by the Crown to investigate the subject, is 51,000,000 roubles, the rouble being considered as a money of account equal in value to a shilling.

Rivers. The principal rivers are the Moskwa, the Oka, and the Kliasma. The Moskwa rises on the borders of Smolensko, and having run for 120 miles, reaches the Capital to which it gives name, whence it flows for about an equal distance before it falls into the Oka near Kolomna. Its utility as the means of inland navigation, is confined above the town to the conveyance of timber; below the town it is the channel of a very brisk trade in provisions and other merchandise sent up for the supply of the Capital. The value of these goods exceeds 14,000,000 roubles annually. The course is very meandering, and the banks in many places highly picturesque. The Oka, which divides this Government from that of Tula, is a large stream, navigable for vessels of considerable burden, and the channel of an active and important trade. The soil of this Government is most part sandy, and not remarkable for fertility. The Northern part is principally a forest, which the vicinity of the Capital however renders valuable. Coxe, whose road lay through it when he visited the City of Moscow, describes it as inexpressibly beautiful. "We passed," he says, "through an avenue cut through a forest, consisting of oak, beech, mountain-ash, poplars, pines, and firs, intermingled in inexhaustible variety, while the sublime effect produced by the gloomy expanse of forest was occasionally relieved by the occurrence of pastures and corn-fields." The peasantry he describes as "a large, coarse, hardy race, and of great bodily strength. Their dress is a round hat, or cap, with a high crown, a coarse robe of drugget (or in winter, of sheepskin with the wool turned inwards) reaching below the knee, and bound round the waist by a sash; trowsers of linen, almost as thick as sackcloth, wrapped round the leg instead of stockings; sandals woven from strips of a pliant bark, and fastened by strings of the same material, which are afterwards twined round the leg, and serve as garters to the woollen wrappers. In warm weather they frequently wear a short, coarse shirt and trowsers." Their food is not scanty though coarse, consisting mainly of black rye-bread and onions, salt-

fish, bacon, raw turnips, mushrooms, of which a prodigious quantity is consumed, and some thousands of cart loads are sent annually to the Capital. Their drink is *quass*, or acid beer, and *votki*, or corn spirit. Much of the land is employed in hop-gardens, or for the growth of vegetables to supply the Capital. The corn produced is inadequate for the supply of the population; so that in addition to the crops, amounting on an average to 2,500,000 quarters, 1,500,000 quarters are every year imported. The gardens produce the *nalivnie*, an apple peculiar to them, large, pellucid, and of a delicious flavour.

Moscow, or (as the Russian word may be more properly represented in English spelling) *Moskwa*, is the Capital of the above Government, and the second city of the Russian Empire in point of population, though in state ceremonies it is allowed precedence above all others. It is now connected with Petersburg by a good road formed of stone broken small, on which stage-coaches plying daily keep up the communication. Tooke observes, with some justice, that it should be considered rather a very thickly-peopled district than a city, so great is the space over which the population is scattered. A number of people, not exceeding 250,000, inhabit a space of twenty-five square miles; so that, if we compare its relative population with that of the most densely-peopled agricultural districts of Britain, the proportion will be found as 20:1; to that of Malta 10:1; to that of London 1:7; to that of Naples 1:10.

Its form is that of an irregular polygon, enclosed by a line of circumvallation twenty-six miles in circumference, within which the ground is diversified by numerous hills, small lakes and ponds, morasses, groves, parks, and the course of the River Moskwa, as well as those of the smaller streams, the Yausa and Neglinnaya. The dwellings are much closer together in the central part than towards the extremities, but no where are twenty houses to be found continuous. It often happens that the stranger, after having passed the gates and entered into the interior, asks how soon he shall leave the suburbs and reach the city, when he is surprised to be informed that he is in one of the finest parts of the town, where, however, he can see nothing but a mixture of fields, cottages, palaces, and public buildings in every style of architecture. All travellers are agreed as to the astonishing and splendid prospect from the Sparrow Hill, commanding a view of the city, with its numerous churches of singular and capricious, yet impressive architecture, adorned with light and lofty turrets, and innumerable bulbous-shaped domes richly gilt. The Kremlin lies below him, with its lofty and massive rampart, and its vast structures, destined for the service of the State. As far as the eye can reach it perceives a succession of Palaces, enlivened by the appearance of their roofs, usually formed of iron plates painted green. In Spring the scene derives still greater interest from the River Moskwa, which, then swollen and rapid, is covered with a great number of timber-rafts, each bearing a hut constructed for the accommodation of the family of the boor who has it in charge. That river, which in Summer is so shallow that it may be forded by children, rises on the melting of the snow nearly thirty feet, and

MOS-COW.

City of Moscow.

Population.

General appearance.

River Moskwa.

MOS-
COW.

lays several square miles of the city for some time under water. The moisture resulting from this cause, as well as from the marshy spots and small lakes dispersed through the town, is sometimes found injurious to the health of the inhabitants, though, in general, from the breadth of the streets, the elevation of much of the ground, and the existence of a number of parks, and other spaces not occupied by dwellings, the average of disease is lower than in most large cities. Nephritic complaints prevail, and are attributed to the use of the calcareous waters of the Moskwa, though more probably caused by the great quantity of acid food used by the inhabitants to counteract the septic quality of salt provisions, which constitute, during Winter, the principal part of their diet. *Votki*, or corn-spirit, is consumed in vast quantities, and produces in the people demoralization and physical degeneracy, similar to that resulting from its use in London and elsewhere. The streets are for the most part paved; but, as the expansion from frost displaces the stones in Winter, those who frequent them must make their way through deep mud in wet weather, and in dry through thick and incessant clouds of dust, disagreeable to the senses and injurious to health. So great is the number of vehicles, and so little the regard paid to the safety of the pedestrian, that it is imprudent to venture on foot through the more frequented parts of the town. The Moskwa separates the city into unequal portions, of which that on its left bank is about four times the size of the other, and contains all that is splendid or worthy of notice. The communication between the opposite banks is maintained by a stone bridge having seven arches, built in 1687, in such a solid and massive style, that the ice and floods, which it has to encounter every Spring, have done it no injury. A canal, connecting the reach of the river above the bridge with that below it, relieves it from the action of a considerable body of the stream. About the beginning of November the surface of the Moskwa becomes a field of ice, traversed in every direction by vehicles, however weighty, and about the end of March the ice breaks up from the united influence of the mild temperature of the season and the pressure of the swelling stream. These changes are so rapid that in two days the weather will change permanently from the mildness of Autumn to the severity of an Arctic Winter, and from that state will pass no less rapidly to the temperature and active vegetation of advanced Spring. In Summer, a great number of flat-bottomed boats, drawing very little water, ascend this river from the Oka, into which it flows; and by this channel the town is principally supplied with the commodities of the Governments lying to the South: those surrounding it in other directions transmit their produce by land. In addition to the stone bridge the Moskwa is traversed by one of wood, laid down every Spring after the ice has passed away, and by several others called living bridges, which are merely rafts extending across the river, and yielding sensibly to the weight of passing vehicles.

Divisions.

The
Kremle.

The city consists of five great divisions: 1. the *Kremle*; 2. *Kitai Gorod*; 3. *Beldi Gorod*; 4. *Zemliandi Gorod*; 5. *Slobodi*, or Suburbs. (1.) The *Kremle* derives its name from a Tatar word signifying fortress. It stands on a lofty and commanding site on the Northern bank of the Moskwa, is of a triangular form, and is enclosed by a rampart two miles in circuit, varying in height from 30 to 50 feet, and generally 15 feet thick, separated from the rest of the town by an espla-

nade 700 feet broad. There are five gates, each of which has a lofty and massive tower. The principal is the Saviour's gate, under which all who pass, be their rank what it may, must uncover the head. At each angle likewise of the ramparts is a tower, and nine others are dispersed over their circuit. The *Kremle* is exclusively the property of the Crown, and contains no private houses. Within its circuit are twelve Churches, besides Chapels attached to Monastic institutions. The principal Church is *Uspenskoï Sobore*, consecrated in honour of the Assumption of the Virgin Mary. It was founded A. D. 1327, and rebuilt A. D. 1479 by an Italian artist, in a style which, though not referable to any determinate Order of Architecture, is not devoid of dignity or beauty. The dimensions are not great, the length is 116 feet, the breadth 81, the height 128. Moscow is a See of one of the four Metropolitan Prelates of Russia, and the ceremonies which he every Easter celebrates in this Church, for the purpose of commemorating the Resurrection, are described by Clarke and other judicious spectators as exceeding in tasteful pomp and effect the most splendid and impressive rites of the Romish Church. The roof of the building has a cupola at each of the four angles, and a central one of superior dimensions, all covered with copper, and terminated by pinnacles, which as well as the crosses that surmount them are richly gilt. The number of images which are disposed over the building exceeds 1300; among them is one intended to represent the Deity under the shape of an old man of majestic aspect and colossal dimensions, the length of the face being 17 feet. This Cathedral is lighted at night by a lustre of massy silver, and weighing 2800 lbs., the wax candles employed are above four inches in diameter. Next in dignity is the Church of Michael the Archangel, which exceeds the former in dimensions, being 140 feet long, 123 wide, 142 high. It is an object of much interest as the depository of the remains of all the Sovereigns of Russia until the reign of Peter the Great. Of the other Churches of the *Kremle*, the most worthy of notice is that of the Annunciation. The Imperial residence in the *Kremle* may be considered under the divisions of the Ancient and the New Palaces. An architect of the name of Bajanof proposed to build a Palace for Catherine II. according to a model still preserved in the Arsenal. This model is in itself a building of no mean dimensions, being twenty-five yards long, and requiring the spectator to ascend a staircase for the purpose of examining the upper part. The great façade, according to the proportions laid down, was to have extended half a mile, and the proposed dimensions and style of building were superior to those of any structure of the same sort in Europe. The estimated expense was fifty millions of roubles, but such projects are more easily made than executed; the model is falling to pieces, and the people do not scruple to express their satisfaction that a design should have been relinquished which would have given them an object for idle gaze and boasting, but must have affected severely the finances, which they well know constitute the weakest part of the national resources. The Ancient Palace of the Tsars is more remarkable for its antiquity and singularity of structure than for its size or beauty. It has massy walls, lofty turrets, commanding a view of the whole city, and small apartments, intended apparently rather to secure a jealous seclusion than to serve the purposes of that rude hospitality and cumbrous state which might be expected in the residence of the ruler of

Gorod.

a vast and barbarous Empire. The New Palace, the present residence of the Autocrat when he visits Moscow, was built in 1743, but enlarged and repaired in 1817. In structure and decorations it possesses little which requires any minute notice. The Audience Chamber is a quadrangular apartment, sixty feet square, reserved principally for Court balls, and exhibiting a brilliant spectacle when decorated for that purpose, and glittering with the rich and jewelled dresses which the Russian Nobility emulously display. In the Kremlé is the Patriarchal Treasury, which among other wealth contains an apparatus intended for the preparation of consecrated oil, formed of solid silver, weighing 706 pounds. Between the Churches of Assumption and Michael is the Great Belfry, or Tower of Ivan Velikii, visible from all parts of Moscow, and for a considerable distance in the surrounding country. Its height is 269 feet, its diameter 32, its shape octagonal; the walls, which are of brick covered with stucco, are every where inside strengthened by huge iron bars, crossing each other, and stretching from one side to the other. Of the thirty-three great bells which it contains, the largest is the *Bolshoi Kolokol*, the weight of which is 144,000 pounds. Clarke thus expresses himself as to the effects produced by its sound: "When it sounds, a deep and hollow murmur vibrates all over Moscow like the fullest and lowest tones of a vast organ or the rolling of distant thunder." Of still greater dimensions is the *Tsar Kolokol*, or King of Bells. It lies in a cavity at the side of the Tower of Ivan Velikii. Its height is 20 feet 7 inches, its diameter 22 feet 8 inches, weight 360,000 pounds; the length of the clapper 14 feet; its diameter where thickest 2 feet. It had been originally cast in 1654, but having been broken up in consequence of an injury sustained in a conflagration, it was recast in 1734. After having hung for a few years, the belfry in which it had been placed was again destroyed, and it fell into the cavity, where it still remains. From the effects of the fire a piece of the metal was cracked off the rim, leaving a vacancy 6 feet high, and nearly 3 feet wide. The substance in that place can be measured, and is 14 inches in thickness; it is asserted to be much more valuable than ordinary bell metal, in consequence of the superstitious Russians having cast great quantities of gold and silver into the melted mass prepared for the mould. The Kremlé also contains the Arsenal, a vast and massive structure, but scarcely quite repaired from the state of ruin in which it had been left by the French, who sprung several mines under it when they evacuated the city in 1812. It is surrounded by 874 pieces of artillery captured from the army of Napoleon, and contains among other military antiquities a huge gun, in proportions resembling a carronade, 16 feet long and of 3 feet calibre. The Kremlé being reserved principally for the Offices of Government, has few inmates at night, except when the Court resides in it on an occasional visit. To the East of this great fortress lies (2.) the *Kitai Gorod*, the grounds for the etymology of which name are not ascertained; but as the signification is Chinese Town, conjecture derives the word from the circumstance that merchandise from China has usually been deposited there. It is surrounded by a wall fifteen feet thick, but inferior in height to that of the Kremlé. The houses are of stone, large, and well built. The *Krasnaya Plotschad*, or Beautiful Place, is very splendid, and attracts the stranger's notice, not merely by its architectural beauty, but as being the scene of the greatest commercial activity

in Moscow, and best adapted for observing the peculiar character of the population. Clarke's description of it possesses his usual liveliness. "Having heard accounts of its immense population, you wander through deserted streets. Passing suddenly to the quarter where the shops are situated, you might walk upon the heads of thousands. The daily throng is here so immense that you ask the cause, and are told that it is always the same. Nor is the costume less various than the aspect of the buildings, Greeks, Turks, Tatars, Cossacks, Chinese, Muscovites, English, French, Italians, Poles, Germans, all parade in the habits of their respective Countries." Though there is much wretchedness as well in Moscow as in other parts of the Russian dominions, the inequality of property places immense funds at the disposal of some, and hence those departments of commerce which minister to luxury are cultivated with activity and success. Russia is perhaps the best market in Europe for jewellery; not only those of noble rank wear jewels to an extent of value scarcely credible, but the wives of substantial citizens vie with each other in these expensive toys, so as sometimes to bring ruin on their husbands. Furs also are eagerly bought up, and so great is the emulous profusion of the wealthy Russians that in the *Krasnaya Plotschad*, the great mart for all articles of luxury, a single skin of the sea-otter or American bear will cost above £100, and a cloak lined with the fur of the black fox will sometimes bring £1200. The centre of the *Krasnaya Plotschad* is decorated by a monument to the memory of Menin and Pojarski, two heroic individuals who, in the beginning of the XVIIth Century, by a course of disinterested exertions and gallant exploits, rescued their Country from the Polish yoke. The group, founded in bronze at the expense of the Crown, cost 150,000 roubles, and in 1817 was opened to public view in the presence of Alexander, amidst various ceremonies destined to impress on the minds of the people the glorious associations which attaches to memories of patriots. The *Kitai Gorod* contains among many other Churches one dedicated to the Virgin Mother, and remarkable, in addition to great architectural splendour, for including within its precinct twenty-one separate Chapels or places of worship.

Without the divisions just described is (3.) the *Beloi Gorod*, or White Town, which derives its name from the colour of the stone used in building the rampart with which it was formerly enclosed. It extends round the central divisions of the city in the form of a crescent, the extremities of which terminate at the banks of the Moskwa. The style of building is very irregular, the houses are much scattered, and to this division, but still more to the two others which remain to be noticed, the remarks of Clarke principally apply, as to the variety and capriciousness of the architecture of Moscow. That entertaining traveller observes, "You behold nothing but a wide and scattered suburb, huts, gardens, pigsties, brick walls, churches, dunghills, palaces, timber-yards, warehouses, and a refuse, as it were, of materials sufficient to stock an Empire with miserable towns and miserable villages. One might imagine that all the States of Europe and Asia had sent a building by way of representative to Moscow; timber huts from regions beyond the Arctic, plastered palaces from Sweden and Denmark, not white-washed since their arrival, painted walls from the Tyrol, mosques from Constantinople, Tatar temples from Bucharia, pagodas from China, cabarets from Spain, architectural ruins from Italy, and warehouses from

MOS-

COW.University.
Exercise
House.

Wapping." The Beloi Gorod contains the University, an extensive and handsome building, raised at an expense of 125,000 roubles, and endowed with an annual income of 130,000. The Exercise House in this division is worthy of notice, not merely as an evidence of the great attention paid by the Russian Government to the organization of its armies, but as an instance of the great skill of the Russian architects in the management and arrangement of timber for constructions; a species of practical knowledge which may be observed also in Switzerland, in America, and other places where extensive forests give an unbounded command of materials. The walls of the Exercise House are of brick, raised on a basement of stone, and measure 42 feet in height, the length is 560, the breadth 158, the area consequently 94,080 feet, and if we allow 20 square feet to each soldier, it will admit 4704 to be exercised at once. The number generally admitted is 2000 infantry and 1000 cavalry. The size and height render it cool in Summer, and in Winter it is warmed by means of stoves. The roof, having a span of 158 feet, rests altogether on the lateral walls. Except the roof of the Corn Exchange at Paris, probably no other framework of timber has the same extent without intermediate support. In this division also is the Foundling Hospital, of vast dimensions, and conducted with a regard to neatness and the health of the children in a manner highly praised by all who have inspected it. It is supported principally by private benefactions, of which the greatest has been that of Dimidof, exceeding £200,000. In the Beloi Gorod also are the most extensive of the frozen markets, where vast quantities of butcher's meat, game, and fish are exposed for sale, so thoroughly frozen and encrusted with ice as to ensure their continuing eatable without decomposition so long as they are allowed to remain at the temperature of a Moscow Winter. The Palace of the Apraxin Family attracts the notice of strangers by its enormous dimensions, far exceeding those of any private residence in Moscow, but disfigured by an usual and sordid practice of letting out the basement story to tradesmen, and reserving only those above for the use of the family, so that under the same roof extremes of profusion and penury, of toil and luxury, may be observed. The Beloi Gorod was formerly surrounded by a rampart, but this has been replaced by a promenade 200 feet wide, adorned with rows of trees.

4. The *Zemlianoi Gorod* completely encircles these divisions. It is more extensive than all of them collectively, but the population is not proportionably great, as much of the ground is occupied by gardens, ponds, groves, and walks. It contains no building meriting peculiar attention. An earthen rampart originally separated it from the Suburbs, but this has been levelled, and the space which it occupied is converted into an avenue shaded with luxuriant timber.

Exterior to all are (5.) the thirty-five Suburbs, or *Slobodi*, separated from the country by a circumvallation, consisting of a fosse ten feet deep, and an earthen mound of the same height. On the Sparrow Hill, outside the town, Alexander laid the foundation of a Church, intended to exceed all others in dimensions and splendour. The height contemplated is 560 feet, the extreme length 2100. Two towers, partly formed out of the artillery taken from the French, will rise at each wing to the height of 350 feet. One of these is to be framed from ordnance captured between Moscow and the frontiers, the other

VOL. XXV.

from such as were similarly obtained between the frontiers and Paris, and Dr. Lyall saw the whole materials lying in the Kremlé. (p. 601.) The cheapness of labour, the abundance of material, and the taste of proprietors, has established a vast and massive style in the buildings of Moscow. The walls are thick, the apartments so lofty, that a single story will rise to the height of two of those in a fashionable residence in London or Paris; the windows are large, often consisting of a single pane worth from £30 to £40.

Moscow has rapidly, though not completely, recovered from the ruin effected during the occupation by the French in 1812, when, in addition to the universal destruction of the public buildings, the property of individuals was visited with such general devastation, that of 10,000 residences computed to have previously existed in the city, 7000 were totally consumed by fire. It at present contains inhabitants (of whom about 4000 are foreigners) 246,545

If a spirit of liberty be any where lurking in Russia it must be searched for in Moscow, where symptoms of insubordination have from time to time appeared, and which is principally inhabited by such of the Nobility as are impatient of the slavish services demanded at the Imperial Court, or disappointed in their schemes of aggrandizement. Aware of the feeling prevalent in the ancient Capital, Catherine II. used to call it her haughty little Republic. During the reign of Paul, when the Deputy Governor was by a capricious ordinance banished to Siberia, the people did not scruple loudly to declare their regret and indignation, and among other instances of generous regard for the sufferer, Clarke mentions that an obscure citizen waited on him, and having ascertained that his pecuniary means were very scanty, insisted on his accepting 25,000 roubles. Generosity, however, it must be acknowledged, is a rare quality among the people, who are charged with avarice and duplicity; and Peter the Great, well aware of this blemish, when solicited to permit the Jews to settle in his dominions, observed jocosely, that he could not assent, as his subjects would be sure to cheat them. The middling and lower classes are accused by travellers of extreme dishonesty and meanness; their characters, however, are said to be exempt from ferocity, so that their drunken festivals are not marked by quarrelling or bloodshed. Provisions are cheap, and the means of subsistence easily procured. Their principal recreations are dancing and drinking, as they are extravagantly addicted to ardent spirits. The use of sour herbs and acid drinks counteracts the scorbutic effects of their salt provisions, and the vapour bath, employed in conjunction with ablutions of soap and water, preserves them from the dangerous consequences which might be expected to result from the filthy state of their houses and clothing. The magnificence exhibited in the entertainments of the wealthy Nobility is not any where surpassed; a single Ball has been known to cost £5000. The women in easy cir-

circumstances are beautiful when young, but from indolence and addiction to the pleasures of the table, they soon acquire such a degree of corpulence as destroys all elegance of appearance. One of the most remarkable features in the character of the Nobles is hospitality, usually unbounded, and in some instances carried to so inconvenient an extent, that individuals of this class have been known to pursue with vindictive annoyance persons who have ceased to frequent their tables, in consequence of giving a preference to those of others. That the citizens of Moscow with all their faults are capable of making the most laudable sacrifices and heroic exertions in the cause of their Country is written in broad and indelible characters on the pages of History.

History

Moscow was founded in 1147 by the Grand Duke Yury, and the slaughters which have from time to time drenched its site with human blood, commenced by the execution of Koutchko, the proprietor of the soil, who was accused of insolence towards his Sovereign. Hence the city was at first called *Koutchkavo*. In 1383 it had already become a large, populous, and wealthy city, which was so tempting an object to Toktamouisch, King of the Tartars, that after an obstinate defence he stormed it, collected a large booty, massacred such of the inhabitants as had not fled, and totally destroyed it by fire. So complete, however, was its renovation, that in the middle of the XVIth century it excited the wonder and admiration of the English Ambassadors, whose accounts give us the impression of its being at that time one of the greatest cities in Europe. In 1571, the Khan of the Crim Tartars advanced to Moscow at the head of 120,000 horse, and finding the town deserted by the Tsar John the Terrible, set fire to it in several places. An English writer who viewed the scene from the walls of the Kremlé, which was effectually defended against the enemy, thus describes it. "There was nothing but whirlwinds, and such a noise as though the heavens would have fallen. The people burning in their houses and streets, but most of all such as laboured to pass out of the gates farthest from the enemy, where meeting together in a mighty throng, and so pressing every man to prevent another wedged themselves so fast within the gate and streets near unto it, as that three ranks walked one upon others head, the uppermost treading down those that were lower, so that there perished at that time by the fire and the press the number of 800,000 people or more." (Fletcher's account quoted in Karamsin, tom ix. 633.) After the departure of the Tartars, the Tsar ordered the remains of the dead bodies to be thrown into the river Moskwa, and so incredible was the quantity, that the stream which during the Spring, when the catastrophe occurred, is deep, broad, and rapid, was dammed up by the accumulation. So sudden and total was the conflagration, that in three hours all Moscow, except the Kremlé, was burned to the ground. The Poles having for some years kept possession of the town found themselves obliged to evacuate it in 1611, when in revenge they reduced nearly the whole of it to ashes. The next disaster was the Plague, which, introduced from Turkey in 1771, raged so dreadfully that 21,401 persons died in the month of September, and 56,672 in the course of the year. But in the eventful history of

Moscow, the occurrences of 1812 claim paramount consideration, whether we regard the gigantic strength of the Powers which contested its possession, the dreadful and sublime scenes exhibited at its conflagration, the weighty and permanent consequences resulting from its fate to the whole civilized world, the number, abilities, and means of information of the writers who as eye-witnesses have described the conflict. Napoleon having concentrated 150,000 men at Borodino on the 7th of September, defeated the Russians under the command of Kutusoff. Though the loss was equal, amounting to about 30,000 men on each side, yet as the French had superior means of recruiting their numbers from the divisions continually marching forward to join them, the Russian Government determined rather to evacuate Moscow than by risking a general engagement to expose to probable destruction the only army at that time available for the defence of the nation. Accordingly the archives, the treasure, and such public property as admitted of being transported with facility, were removed, and the inhabitants, terrified at the impolitic and outrageous barbarities which every where marked the advance of the French, attended the retreat of the army; with the exception of about 15,000 individuals, detained either by sickness or a desire of plunder. On the 14th the French army occupied Moscow, and on the 15th Napoleon took up his quarters in the Kremlé, but was soon disturbed by the alarm of fire, which burst out in several hundred places at once all over the city. The conflagration ceased on the 21st, after having consumed most of the public buildings and seven-tenths of the private residences. On the 21st of October, the French army, after the Kremlé had been dismantled by the explosion of mines, finally evacuated the town, in which it had lost 40,000 men by disease, by the casualties of the conflagration, and by the desultory attacks of the enemy. It is still a matter of doubt whether the burning of Moscow should be attributed to the excesses of the French troops, to the despair of the citizens, determined that the enemy should not enjoy the property which they had themselves been obliged to desert, or to the decisive and stern policy of the Russian Government, resolved to cut off all hope of accommodation, and to deprive Napoleon's numerous army of the shelter which the buildings of Moscow alone could afford against the inclemency of the approaching Winter. Boutourlin, in his account of the campaign of that year, insinuates that the conflagration was effected in conformity to the orders of the Emperor Alexander. Rostopchin, on the contrary, who has been generally considered as the principal agent in the event, solemnly and pertinaciously denies that it was the work of the Russians, and charges it on the vindictive and rapacious spirit of the French troops. Moscow is 397 miles South-East of Petersburg, in 55° 45' 4" latitude and 37° 31' East longitude.

MO-
SELLE.
—
MOSS.

MOSELLE, a Department in the North-East of France, including parts of Lorraine and Luxembourg, is bounded on the North by the Department of the Forests, on the North-East by Sarthe, on the East by Mont Tonnerre and the Sarthe, on the South-East by the Lower Rhine, and on the South and West by the Meuse. Its surface is very uneven, being traversed by branches of the great mountain range of the Vosges. The chief rivers are the Moselle, the Sarre, the Seille, the Nied, and the Orne: it has in several parts extensive tracts of marshy ground. The soil is in some parts chalky, in others stony. The quantity of corn raised is not equal to the consumption of the inhabitants. The lower orders live in a great measure on barley bread and potatoes. The pastures are in general poor, and the breed of cattle small. Flax, hemp, and rapeseed are produced in considerable quantities, and great attention is paid to the cultivation of a very excellent wine, of which about 40,000 hogsheads are annually made. The mineral productions are iron and coal. The quantity of coal annually obtained is about 6000 tons, of iron nearly 7000. The superficial extent of the Department is 2600 square miles; the population is 340,000, of whom two-thirds speak German, and the rest a patois of German and French. It is divided into four Arrondissements, viz. Metz, the Capital; Briey; Thionville; and Sarreguemines.

MOSQUE, Fr. *mosquée*; It. *moscha*; Sp. *mesquita*. Menage observes that throughout the Oriental Languages *sagad* signifies to adore, and that the Arabic *mesgid* is a place of adoration.

Would not Heraclitus laugh to see Macrine,
From hat, to shoe, himself at dore refine,
As if the presence were a *moschile*.

The wat'ry tyrant calls his brooks and floods,
Who roll from *mossy* caves, their moist abodes,
And with perpetual urns his palace fill.

Dryden. *Ovid. Metamorphoses. The Giants' War*.

What more beautiful objects in nature, than the stalk and buds of the *moss-rose*! To the sense of touch they are positively disagreeable; but we think of them only with a reference to the sense of smelling and sight; and the effect is on the whole beautiful.

Stewart. *Philosophical Essays*, ess. 1. ch. iv. p. 256.

MOSSTROOPERS, as described in Sibbald's *Glossary*, cited by Jamieson, are "those Banditti who inhabited the marshy country of Liddesdale, and subsisted chiefly by rapine. People of this description were called in Ireland *Bogtrotters*, apparently for a similar reason." Bailey, in his *Dictionary*, removes them into a Country in which their habits of plunder would soon be extinguished by lack of excitation; he calls them "a sort of Robbers which were in the Northern parts of Scotland."

Sir Walter Scott, who has made good use of these very picturesque Thieves, has guided us in his Notes on *The Lay of the Last Minstrel* to the following very ample description of them, fully impregnated with the amusing quaintness of its author's general style. It is written by Fuller in his account of Cumberland.

"Although if the word wonders be strained up high and hard this country affordeth none, yet if the sense thereof be somewhat let down the compass thereof fetcheth in the Moss-troopers, so strange the condition of their living, if considered in their Original, Increase, Heighth, Decay, and Ruine. 1. Original. I conceive them the same called Borderers in Mr. Camden, and charactered by him to be a wild and warlike people. They are called *Moss-troopers* because dwelling in the Mosses, and riding in *troops* together. They dwell in the bounds or meeting of two Kingdoms, but obey the laws of neither. They come to church as seldom as the 29th of February comes into the Kalendar. 2. Increase. When England and Scotland were united in Great Britain, they that formerly lived by hostile incursions betook themselves to the robbing of their neighbours. Their sons are all free of the trade by their father's copy; they are like unto Job, (not in piety and patience, but in suddain plenty and poverty,) sometimes having flocks and herds in the morning, none at night, and perchance many again next day. They may give for their motto *vivitur ex rapto*, stealing from their honest neighbours what sometimes they regain. They are a nest of hornets, strike one and stir all of them about your ears. Indeed if they promise safely to conduct a Traveller, they will perform it with the fidelity of a Turkish Janizary, otherwise wo be to him that falleth into their quarters.

TROOP-
ERS.

MOSS-
TROOP-
ERS.

3. **Heighth.** Amounting forty years since to some thousands. These compelled one viceroy to purchase their security by paying a constant rent to them. When in their greatest height they had two great enemies, the Laws of the Land, and the Lord William Howard of Naworth. He sent many of them to Carlisle, to that place where the officer always doth his work by daylight. Yet these Moss-troopers, if possibly they could procure the pardon for a condemned person of their company, would advance great sums out of their common stock, who, in such a case, cast in their lots among themselves, and all have one purse. 4. **Decay** caused by the wisdom, valour, and diligence of the Right Honourable Charles Lord Howard, Earl of Carlisle, who routed these English Tories with his regiment. His severity unto them will not only be excused but commended by the judicious who consider how our great lawyer doth describe such persons who are solemnly outlawed. *Extunc gerunt caput lupinum; ita quod sine judiciali inquisitione ritè pereant, et secum suum judicium portent; et merito sine lege pereunt qui secundum legem vivere recusarunt.* Thence forward (after they are outlawed) they wear a wolf's head; so that they lawfully may be destroyed without any judicial inquisition, as who carry their own condemnation about them, and deservedly die without law because they refused to live according to law. 5. **Ruine.** Such the success of this worthy Lord's severity that he made a thorough reformation amongst them, and the Ring-leaders being destroyed the rest are reduced to legal obedience, and so I trust will continue."

Much information on the state of the Borders, and the ravages of the Mosstroopers and their opponents during various periods of our History, may be found in the *Introductory Discourse* prefixed to Nicolson's *History and Antiquities of Cumberland and Westmoreland*, by Richard Burn. The following is an abstract of fearful retaliation by the English in a single foray from July 2 to November 17, 1544.

Towns, Towers, Stedes, Barnekyns, (the outermost ward of a Castle in which were placed the barns, stables, and cowhouses,) Parish Churches, Bastel Houses, (Monasteries or Hospitals,) cast down or burned...	192
Scots slain	403

And in the year following between September 8 and 23, } Monasteries and Friar Houses burned and destroyed. }	7
Castles, Towers, and Piles	16
Market Towns	5
Villages	243
Mills	13
Hospitals	3

The enumeration of crimes over which the Lord Warden of the Marches had jurisdiction is not a little terrific. He had a Council who were to inquire into murders, maimings, fire-raising, violent thefts, deadly feuds, cutting down trees, sowing corn in the opposite realm, depasturing cattle, following stolen goods into the opposite realm, and pursuit of *hot trod* with hound and horn, hue and cry. *Hot trod* was a pursuit *flagrante delicto*, with *red hand* as the Scots call it, by dogs called *slough* dogs, from their pursuing the Mosstroopers through the *sloughs*, mosses, and bogs, passable by those only who were acquainted with the bypaths and turnings.

Besides these offences there were yet many others, as reception of fugitives, loitering, breach of safe-conduct or of truce, perjury, over swearing, rescue, retaliation, &c.

Some of the names of the principal Scotch offenders contained in Bills of complaint exhibited before the Bishop of Carlisle, about ten years afterwards, amply testify to the genuineness of Sir Walter Scott's descriptions. We read of Jock of Kinmint, Will's Jock Grame, Geordie's Christie, Black Jock's Johnie, Dick's Davie's Davie, Hector of Harelaw, Emie of Gingles, Mickle Willie Grame, Will Grame brother to Hutchin, Gib's Jack's Johnie, Tom's Robbie, Patie Geordie's Johnie, George of the Gingles, alias Henharrow, *John Nelson Curate of Bewcastle*, Wat Grame flaughtail, John Noble alias Langfoot, Nimble Willie, Mickle Willie, *Will Patrick Priest of Bewcastle*, Black Will Storie of Bewcastle, John of the Side, (Gleed John,) Red Rowy Forster, with about 400 more; and perhaps no Catalogue of more bloody and determined ruffians was ever arranged.

Some of the adventures of Sir Robert Cary, afterwards Earl of Monmouth, consecutive Warden of the West, East, and Middle Marches, as recorded by himself, and printed in the above-named Work, are highly romantic. On the capture of a great thief called Geordie Bourne, a principal favourite of Sir Robert Ker, the opposite Scotch Warden, all the neighbouring Gentlemen assured Sir Robert Cary that he might bring Sir Robert Ker to what conditions he pleased if he would but spare his prisoner, and that on the contrary if he executed him they must be forced to quit their houses and fly the country, for his fury would be so great that he would use all his strength and power utterly to destroy the March. Sir Robert Cary visited his prisoner on the same night, disguised in one of his servant's liveries, and Geordie having been told that his master would not do any thing to save his life, voluntarily said, "that he had lived long enough to do so much as he had done;" adding, that he had debauched more than forty men's wives, "what in England what in Scotland; and that he had killed seven Englishmen with his own hands, that he had spent his whole time in lewdness, drinking, stealing, and taking deep revenge for slight offences. He seemed to be very penitent, and much desired a Minister for the comfort of his soul." Sir Robert Cary sent him a Minister, and hanged the culprit early on the following morning.

The Mosstroopers, however, robbed according to method, and were by no means ordinary Thieves.

"Among other malefactors," says the same writer, "there were two *gentlemen* thieves that robbed and took purses from travellers on the highways, (a theft that was never heard of in these parts before.) I got them betrayed, took them, and sent them to Newcastle gaol, and there they were hanged." The Borders grew more civilized after the accession of James I., by whom in 1604 the turbulent Grames were *transplanted*, as the Royal Proclamation, with great courtesy, styles their forcible banishment. The Union may be considered as having completely terminated those disorders, so that, according to Bishop Nicolson's concluding note, no Moss-trooping existed after 1706, except, it may be added, that gentle kind practised by Young Lochinvar. "There is now remaining only one species of theft peculiar to the Borders; and that is where a man and woman steal each other; they hasten to the Borders. The kindred of the one side or the other sometimes rise and follow the fray. But the parties fugitive most commonly outstrip them;

For whan his semblant is *moste* clere,
Than is he *moste* derke in his thought.

Gower. Conf. Am. book ii. p. 59.

Of that commixtion they did then beget

This hellish dog, that hight the blatant beast;

A wicked monster, that his tongue doth whet

'Gainst all, both good and bad, both *most* and least.

Spenser. Faerie Queene, book iv. can. 6.

Now being broad day Æmylius' triumph was referred to the *most* number of voices of the people, and the first tribe flatly did deny his triumph.

Sir Thomas North. Plutarch, fol. 218. *Paulus Æmilius*.

Most strength the moving principle requires;

Active its task, it prompts, impels, inspires.

Pope. Essay on Man. Epistle 2. v. 67.

"Religions that arise in ages totally ignorant and barbarous, consist *mostly* of traditional tales and fictions, which may be different in every sect, without being contrary to each other.

Hume. Essay 7. vol. i. p. 56.

MOTACILLA, Bechstein and Temm.; *Wagtail*, Pen. In *Zoology*, a genus of animals belonging to the family *Dentirostres*, order *Passeres*, class *Aves*.

Generic character. Beak straight, slender, awl-shaped, cylindrical, and angular between the orbits; the edges of the lower mandible compressed; nostrils ovoid, lateral, basal, partly closed by a naked membrane: tarsi twice as long as the middle toe; toes three in front, the outer of which is connected at its base with the middle, and hinder one, of which the nail is much longer than those in front which are very short, the second quill-feather the longest, and the place of the first occupied by one of the greater coverts; tail very long, equal, and horizontal.

The birds composing this genus were separated by Bechstein from the great genus *Motacilla* of Linnæus, and are divided by Cuvier and Lesson into two genera, the *Motacilla* and the *Budytes*, the latter of which have the claw of the hind toe but slightly arched, and longer than the other species. Temminck, however, includes all under the present, not considering this slight variation a distinction sufficient for founding a new genus. They live on the banks of rivers or in watery meadows among the cattle, running round them, for the purpose of catching the flies which settle about their legs, and perhaps also the larvæ disturbed by their steps, for which purpose they not unfrequently follow the plough; they are extremely

active and continually elevating and depressing their tails, whence has arisen their common appellation. They appear to be connected with Wading birds by the length of their legs, and by their long scapulars, which when the wings are folded cover their tips. According to Temminck they are found only in the Old World.

M. Lugubris, Pallas; *la Lavandière Lugubre*, Less. About seven inches long; the upper part of the body, the throat and chest, deep black, as are also the middle eight caudal quills; the forehead, ocular, and aural regions, and the remaining under parts, and the outer caudal quills, white; the sides greyish-black, and often completely black; the wings black, but the coverts edged with white externally; irides, beak, and legs black. In Winter the throat becomes white, and there is merely a black collar on the neck, the edges of which reach up towards the ears. Is a native of the Eastern parts of Europe, and of the South of France. Temminck states that they do not differ from the species shot in Egypt.

M. Alba, Lin.; *la Lavandière*, Buff.; *White Wagtail*, Lath. Same size as the former; the back and sides ash; the back of the head and neck, the throat, chest, tail-coverts, and middle quills black; forehead, cheeks, sides of the neck, and other under parts, and outer tail-quills white; wing-coverts black, edged with white. In Winter the throat and front of the neck becomes white, excepting the black collar, which still remains; the ash colour becomes lighter. This species extends even into the Arctic Circle.

M. Boarula, Gmel.; *la Bergeronette Faune*, Buff.; *Grey Wagtail*, Bewick. Rather larger than the last; the upper parts grey; a white streak above the eyes and on the sides of the throat which is black; the other under parts light yellow; the rump olive-yellow; wings and the middle six caudal quills black edged with white and olive; of the three other lateral quills of the tail, the outer is white, the two inner have the external webs black: the female has the throat white with a reddish tinge instead of being black, the streak over the eyes yellowish, the upper parts tinged with olive, and the under parts paler yellow. This species remains in England through the Winter, and is found throughout Europe, especially in the North.

M. Citreola, Pall.; *la Bergeronette Citrine*, Tem.; *Yellow-Headed Wagtail*, Pen. About seven inches long; the head, cheeks, and under parts bright citron-yellow; the back of the neck marked with a black crescent; the other upper parts, the lesser wing-coverts, sides of the chest and belly leaden-grey; quills of the wings and tail blackish, except the two lateral, which are white; beak and legs brown. The female has not the black crescent on the neck, neither has the male during Winter. Old females are distinguished by the under parts being of a brighter yellow, and by the parts which in the male are leaden-grey, being olive-grey. It is found in Eastern Russia, in the Crimea, perhaps also in Hungary and the Archipelago.

M. Flava, Lin.; *la Bergeronette de Printemps*, Buff.; *Yellow Wagtail*, Pen. About six inches long; head and back of the neck ashy-blue, all the other upper parts olive-green becoming lighter on the rump; a white streak passes from the upper mandible above the eyes, another from the lower beneath the ears; under parts bright yellow; wings and middle tail-quills blackish, edged with yellowish-white, the outer white; the tail itself slightly rounded. The back of the female is

MOTA-
CILLA.

CILLA.
—
MOT.

greyer, the under parts less bright and the throat white. This bird is seen early in the Spring among the green corn, in Winter it is found by the side of unfrozen brooks. It is common throughout Europe, especially in the North.

See Temminck, *Manuel d'Ornithologie*; Cuvier, *Règne Animal*; Pennant, *British Zoology*.

MOT, } Fr. *mot*; It. *motto*; Sp. *móte*; Lat. *Mo'tro*. } *mut-ire*; Gr. *μῦθος*:

A word, a saying.

This is the day: Now what of this day? There shall be a *motto* written: An honourable *motto*, such as was written upon the turban of the High Priest, holiness to the Lord.

Hall. *Works*, vol. i. fol. 406. *The Imprese of God*, part i.

It was the *motto* that was wont to be written upon the Scottish coin, as the emblem of their thistle, *Nemo me impunè lacescet*; "None shall scape free, that provokes me."

Id. *Sermon 37. The Sin and Punishment of Grieving the Holy Spirit*.

When Mævio's first page of his poesy,
Nay'd to a hundredth postes for noveltie,
With his big title an Italian *mott*
Layes siege unto the backward buyers grote.

Hall. *Satire 2*, book v.

Reproach is stamp'd in Collatinus' face,
And Tarquin's eye may read the *mot* afar,
How he in peace is wounded—not in war.

Shakspeare. *Rape of Lucrece*.

Mr. Ley, in the 1st volume of Hearne's *Collections*, is very sententious on *MOTTOS*. "Of *Motts*. Whether they are called *motts* of the French, because they are short and compendious, and as it were expressed in one word; or else of the Saxon *gemot*, because the sentence doth meet or concur with the nature or quality of something depicted; or else because they are *motives* of a thing in part expressed by word, and in part left unto conceit, I will not dispute; but tho' neither of these is the original cause or reason, yet the same is accompanied with them all. The antiquity of them is equal with wars and witt; wars to minister matter, and witt to frame it into form; in which there are divers properties commendable. 1st. In a word to contain a World; 2dly, when thereby a dumb beast, a bird, or dead creature, doth, as it were, speak and bewray his own primary quality; 3dly, when the simple cannot understand it, and yet the wise cannot but understand it." (204.)

"For a word annexed to any impress or armes," says Sir Robert Cotton in the same volume, "I cannot remember any here before Henry II., who is by some writers observed to bear a sword and olive-branch together, wreathed with this word, *utrumque*. Such a like in regard of the connexity, though not in sense like, was that Dolphin twisted upon an anchor on Vespasian's coin, with this word, *Festina lentè*. Richard I. used a mailed arm holding a shivered lance, the word *Labor viris convenit*. Edward IV. his White Rose closed in an Imperial Crown, the word *Rosa sine spinâ*. Edward VI. a sun shining, the word *Idem per diversa*. Queen Mary a sword erect upon an altar, *Pro arâ et Regni custodiâ*; but more subtle than any of these, was that of the last Scotch Queen Mary, who after her French marriage stamped a coin where on the one side was the impaled arms of Scotland and France, on the other between two Islands and a starry heaven, two Crowns Imperial, the word *Aliamque moratur*." Private mottos, according to the same authority, did not exist till the time of Henry VIII. "Whence from I take we borrow

these sentences or words which I pass to remember in regard of their multitude, since they fall fitter to those better Students of Arms to observe." (184.)

MOTE. See MIGHT.

MOTE, *mot* is found in A. S. but no traces of it in D., Germ., or Swed. It is probably a *mite*, and so called from its smallness.

Or hou seist thou to thi brother, brother suffre I schal do out a *mote* (A. S. version, *mot*) fro thin yghe, and lo a beam is in thin owne yghe.

Wiclif. *Matthew*, ch. vii.

Or why sayest y^a to thy brother: suffre me to plucke out the *mote* out of thyne eye & behold a beame is in thine own eye.

Bible, Anno 1551.

That serchen every land and every streme,
As thikke as *motes* in the sonne-beame.

Chaucer. *The Wif of Bathes Tale*, v. 6451.

For whoso will his handes lime,
They muste be the more vnclene.
For many a *mote* shall be sene,
That will not cleue elles there.

Gower. *Conf. Am.* book ii. p. 49.

And fancies fond with gaudy shapes possess,
As thick, as numberless,
As the gay *motes* that people the sun-beams.

Milton. *Il Penseroso*, l. 8.

For *motes* may enter, where beams cannot; and small offences find admittance, where great and clamorous crimes fright the soul to a standing upon its guard, to prevent the invasion,

South. *Sermons*, vol. vi. p. 391.

In a dark'ned room, where the light is permitted to enter but at one hole, (I have often observed) the little wandering particles of dust, that are commonly called *motes*, and, unless in the sun-beams, are not taken notice of by the unassisted sight.

Boyle. *Works*, vol. vi. p. 689. *The Experimental History of Colours*.

MOTEN. See MOOT.

MOTH, } Wiclif writes *moughte*; A. S. *mogthe*,
Mo'THEN, } *mothe*; Ger. and D. *molte*, Sw. *mott*;
Mo'THY. } from Ger. *mâhen*, *mayen*, *maiten*, to cut, to sever. Wachter. The same word as *mouth*, (Goth. *mat-gith*;) that which eateth; the third person of the indicative of Goth. *matian*; A. S. *metian*, *edere*, to eat. Tooke.

An insect that *eateth* or *fretteth* a garment. The trivial name of the *Phalæna tineæ* of Linnæus.

An unredy reve. þi residue shal spene
That meneye *mothpe* was ynn.

Piers Plouhman. *Vision*, p. 213.

Nile ye tresoure to you tresouris in erthe were rust and *mought* distryeth.

Wiclif. *Matthew*, ch. vi.

So y^t ye gather you not treasure vpon y^e earth, where rust and *mothes* corrupt.

Bible, Anno 1551.

These wormes, ne these *mothes*, ne these *mites*
Upon my paraille frett hem never a del,
And wost thou why? for they were used wel.

Chaucer. *The Wif of Bathes Prologue*, v. 6114.

Salomon sayth, that right as *mouthes* in the shepes fleese anoieth to the clothes, and the smale wormes to the tree, right so anoieth sorwe to the herte of man.

Id. *The Tale of Melibeus*, p. 107.

Your riches is corrupte, your garmetes are *mothe-eaten*.

Bible, Anno 1551. *Judas*, ch. v.

The *moath* breedeth upon cloth; and other lanifices: especially if they be laid up dankish, and wet.

Bacon. *Natural History*, Cent. vii. sec. 696.

His horse hip'd with an olde *mothy* saddle and stirrups of no kindred.

Shakspeare. *Taming the Shrew*, fol. 219.

Neglected heaps we in by-corners lay,
Where they become to worms and *moths* a prey.

Dryden. *The Art of Poetry*.

MO'THERLIKE, } Gr. μά-ειν, *vehementer cupere*.
MO'THERLY, adj. } Rudbeckius (see *Ihre*) from the
MO'THERLY, adv. } Sueo-Gothic *moeda* ; labor, a
partus labore : others that the first syllable is *ma*. See
MAMA, FATHER, and PAPA.

The parent, producer, or bearer ; one who, that which,
bears or produces, *sc.* children, young of their own kind,
any offspring.

Also applied to any person or thing having the seniority,
rank, or authority of a *mother*.

The Mother : in the original of the passage quoted from
Holland's *Plinie, tumens alvus et suffocatio mulierum*,
in others, *strangulatio, conversio vulvæ, conversa vulva*.
Gr. ὑστερικὴ πνιξ, *hysterica suffocatio*.

A clerk þoru enchantement hym bygan to telle,
þat þe schulde first fader and *moder* quelle.

R. Gloucester, p. 10.

Whan Marie the *moder* of Jhesus was spoused to Joseph before
thei camen togadre she was foundun hauynge the Holy Goost in
wombe. *Wichf. Matthew, ch. i.*

Whē his [Jesus] *mother* Mary was married to Joseph, before they
came to dwel together, she was founde w^e childe by the Holy
Goost. *Bible, Anno 1551.*

A cleen religioun and an unwemmed anentis God and the *fadir*
is this, to visite *fadirles* and *modirles* children and widewis in hir
tribulacioun, and to kepe himsilff undefouled in this world.

Wichf. James, ch. i.

Bidding the quene, whan the child wer borne,
Without mercy or *moderly* pite
That he be dead.

Lidgate. The Story of Thebes, part i.

There was enough to wepe and crie
Amonge the *moders*, whan thei herde
Howe wofully this cause ferd.

Gower. Conf. Am. book ii. p. 70.

Thus she that was as who saith madde,
Of wo, whiche hath hir ouerladde,
Without insight of *motherhed*,
Forgate pitee.

Id. Ib. book v. p. 167.

At both these times were they *motherles* and helplesse, con-
cernyng theyr owne strengthes : but were yet cared for of God and
receyued by his mercede.

Bible, Anno 1551. Ezechiel, ch. xxvi. notes.

The *motherelaw* agaynst her daughterelaw, & the doughterelaw
agaynst her *motherelawe*. *Id. Ib. Luke, ch. xii.*

Y^e felde is called in theyr *mother-töge*, Acheldama, that is to say,
the bloude feld. *Id. Ib. The Actes, ch. i.*

VIOL. You, sir,

Would have me *mother* bastards, being unable
To honour me with one child of mine own.

Beaumont and Fletcher. The Spanish Curate, act iv. sc. 2.

The rising or suffocation of the *mother* in women with the tor-
ments and paines thereto incident it cureth.

Holland. Plinie, book xx. ch. v.

They do use for the accident of the *mother*, to burn feathers, and
other things of ill odour : and by those ill smels, the rising of the
mother is put down.

Bacon. Natural History, Cent. x. sec. 935.

I'll to thee a simnell bring,
'Gainst thou go'st a *mothering* ;
So that, when she blesseth thee,
Half that blessing thou'lt give me.

Herrick. Hesperides, p. 278.

LEAR. Oh how this *mother* swells vp toward my heart.

Shakspeare. Lear, fol. 293.

And *mother-like* I moane their death

And yet their death allow.

Warner. Albion's England, book v. ch. xxiii.

Th' air doth not *motherly* sit on the earth,
To hatch her seasons and give all things birth.

Donne. An Anatomy of the World. The First Anniversary.

Consecrating the little rest of my time to those studies to which
nature had so *motherly* inclined me, and from which fortune like a
stepmother has so long detained me.

Cowley. Essay 10. The Danger of Procrastination.

Where thou shalt see the blessed *mother-maid*
Joy in not being that which men have said ;
Where she's exalted more for being good,
Than for her interest of *motherhood*.

Donne. The Progress of the Soul. The Second Anniversary.

For all that Nature by her *mother-wit*
Could frame in earth, and forme of substance base,
Was there.

Spenser. Faerie Queene, book iv. can. 10.

Me, let the tender office long engage,
To rock the cradle of reposing age,
With lenient arts extend a *mother's* breath,
Make languor smile, and smooth the bed of death.

Pope. Prologue to the Satires, l. 412.

My *mother* ! when I learn'd that thou wast dead,
Say, wast thou conscious of the tears I shed ?
Hover'd thy spirit o'er thy sorr'wing son,
Wretch even then, life's journey just begun ?

Cowper. On the Receipt of my Mother's Picture.

As *mothers*, women have for some time, and that the most critical
time too, the care of the education of their children of both sorts,
who, in the next age, are to make up a great body of the world.

Horne. Works, vol. v. p. 200. Discourse 15.

As we call our first language our *mother tongue*, so we may as
justly call our first tempers our *mother tempers*. *Id. Ib.*

MO'THER, v. } D. *moeder, modder, fæx, fæces* ;
MO'THER, n. } Sw. *modder, mud*. Applied to
MO'THERY. } The muddy or thick substance, that
gathers together or concretes in liquors.

The third (instance, wherein crude and watery substance turneth
into fat and oily) is in the inception of putrefaction ; as in water cor-
rupted ; and the *mothers* of waters distilled.

Bacon. Natural History, Cent. iv. sec. 357.

They oint their naked limbs with *mother'd* oil
Or from the founts where living sulphurs boil,
They mix a medicine to foment their limbs ;
With scum that on the molten silver swims.

Dryden. Virgil. Georgics, book iii.

Or if there is such a juice as Borri pretends, is it not enough to
make the clearest liquid in the world both feculent and *motherly* ?
Sterne. Works, vol. i. p. 158. Tristram Shandy, ch. xix.

MOTION. See **MOVE.**

MO'TTLE, v. } A colour mixt (or medled) of black
MO'TLEY. } and white : *q. d. medley*. Skinner.

See **MEDDLE.**

The mixture or *medley* of various colours ; (not merely
black and white.)

A merchant was ther with a forked berd,
In *mottelee*, and highe on horse he sat,
And on his hed a Flaundrish bever hat.

Chaucer. Prologue to the Canterbury Tales, v. 254.

The *mottled* meadows then, new varnish'd with the sun,
Shoot up their spicy sweets upon the winds that run,
In easily ambling gales.

Drayton. The Muses' Elysium. Nymphal 6.

For, but thyselfe, were, out of *motlys* hee
Could save that line to dedicate to thee.

Ben Jonson. Epigram 53. book i. part ii. fol. 16.

CLAR. How have you work'd

This piece of *motly* to your ends ?

Beaumont and Fletcher. The Lover's Progress, act i. sc. 1.

His *motley* mail scarce could the hero bear,
Haranguing thus the tribunes of the war.

Garth. The Dispensary, can. 5. l. 152.

Why will you join in common-field where pitch,
Noxious to wool, must stain your *motley* flock
To mark your property ?

Dyer. The Fleece, book ii.

and the woorker of all goodness.*Udall. To Queen Catherine, sig. CC. iiiii.*We haue found this man a pestilent felowe, and a *mouer* of de-
bate vnto all y^e Jewes thorowout y^e worlde.*Bible, Anno 1551. Actes, ch. xxiv.*Nor they shall pay nothyng for that they may spende aboue
v.M.li. nor for their *mouables*.*Lord Berners. Froissart. Cronycle, vol. i. ch. 155. p. 187.*

I saw two angels play'd the mate;

With man, alas! no otherwise it proves,

An unseen hand makes all their *moves*.*Cowley.*If it be in some part *movent*, and in some part quiescent, it must
needs be a curved line, and so no radius.*Grew. Cosmo Sacra.*But whether the sun, or earth, be the common *movent*, cannot be
determin'd but by a farther appeal.*Glanvil. The Vanity of Dogmatizing, ch. ix. p. 78.*

PROTA. You yourself

That are our *mover*, and for whom alone

We live, have fail'd yourself in giving way

To the reconcilment of your son.

*Beaumont and Fletcher. Thierry and Theodore, act ii. sc. 1.*So sacred was the *movable* temple of God, and with such reve-
rence guarded and transported, as 22,000 persons were dedicated to
the service and attendance thereof.*Raleigh. History of the World, book ii. ch. v. sec. 1.*His back-piece is composed of eighteen plates, *movably* joined
together by as many skins.*Grew. Museum.*It seems Du Moulin tooke his errour at leastwise touching the
moueableness of the poles of the equator from Joseph Scaliger.*Hakewill. Apologie, book ii. ch. iii. sec. i. fol. 92.*I would haue had them writ more *mouingly*.*Shakspeare. Two Gentlemen of Verona, fol. 24.*Making the like suites, as his wife before his coming had *motioned*
unto his lordship.*Holinshed. Ireland, vol. vi. p. 375.*DON. Well, sir, if I hear any of your apish running to *motions*,
and fopperies, till I come back, you were as good not; look to't.*Ford. Tis pity she's a Whore, act ii. sc. 4.*

The gumme downe roping from their pale dead eyes,

And in their pale dul mouths the jymold bitt

Lyes foule with chaw'd grasse, still and *motionless*.*Shakspeare. Henry V. fol. 86.*And here, alas, what shall we say to those men that take pleasure
in the embroiling of states? that with Nero, can sing to see the city
on fire? that love to dance upon a quaking earth? yea, that affect
to be actors in these unkindly *motitions*.*Hall. Sermon 33. The Mischief of Faction and the Remedy of it.*

So these respects, which were

Born of a present feeling, *moved* him most;But soon were with their times and *motives* lost.*Daniel. History of Civil Wars, book viii.*Besides, another *motive*-power doth rise

Out of the heart, from whose pure blood do spring

The vital spirits; which, born in arteries,

Continual *motion* to all parts do bring.*Davies. The Immortality of the Soul, sec. 23.*These bodies likewise being of a congenerous nature, do readily
receive the impressions of their *motor*.*Sir Thomas Brown. Vulgar Errours, book ii. ch. ii. p. 63.*Surely many things fall out by the design of the general *motor*,
and undreamt-of contrivance of nature, which are not imputable unto
the intention or knowledge of the particular actor.*Id. Ib. book iii. ch. x. p. 162.*

MOVE.

MOVE.

MOUGHT.

We met the carrier coming the way we were going, who assured us, that the cavaliers had eased them at Basingstoke of all their superfluous *movables*.

Boyle. *Works*, vol. i. p. 28. *The Life*.

I do accordingly here leave that old, trite, common argument, (though nevertheless venerable for being so,) drawn from a constant series, or chain of causes leading us up to a Supreme *Mover*, (not *moved* himself, by any thing but himself,) a being simple, immaterial, and incorporeal: I leave this, I say, to our high and mighty atheists to baffle and confute.

South. *Sermons*, vol. iv. p. 409.

He [Christ] does not only hear our sighs, but also feels the cause of them: and if we suffer by the direct impressions of pain, he also suffers by the *moovings* and yearnings of his own compassion.

Id. *Ib.* vol. ii. p. 190.

Though these insects did in so short a time grow *moveless*, yet they were not so soon killed.

Boyle. *Works*, vol. i. p. 176. *A Defence of the Doctrine touching the Spring and Weight of Air*.

In human works, though labour'd on with pain,
A thousand *movements* scarce one purpose gain;
In God's, one single can its end produce;
Yet serves to second too some other use.

Pope. *Essay on Man*, epis. i. l. 63.

And in effect, there is a strange *movingness*; and, if the epithet be not too bold, a kind of heavenly magick to be found in some passages of the scripture, which is to be found no where else; and will not easily be better expressed, than in the proper terms of the scripture.

Boyle. *Works*, vol. ii. p. 319. *Touching the Style of the Holy Scripture*.

The atomists, who define *motion* to be a passage from one place to another, what do they more than put one synonymous word for another? For what is passage other than *motion*?

Locke. *Of Human Understanding*, book iii. ch. iv. sec. 3. fol. 262.

Tis plain the meaning of the question, What determines the will? is this; what *moves* the mind, in every particular instance, to determine its general power of directing to this or that particular *motion* or rest? And to this I answer, the *motive* for continuing in the same state of action is only the present satisfaction in it; the *motive* to change is always some uneasiness; nothing setting us upon the change of state, or even upon any new action, but some uneasiness. This is the great *motive* that works on the mind to put it upon action, which for shortness' sake we will call determining of the will.

Id. *Ib.* book ii. ch. xxi. sec. 29. fol. 104.

God has made all things in *motion*, and the design of *motion* is a further perfection.

South. *Sermons*, vol. vii. p. 301.

The water-nymphs, who *motionless* remain'd,
Like images of ice, while she complain'd,
Now loos'd their streams.

Congreve. *Lamenting the Death of the late Marquis of Blandford*.

The monster, *moveless* as a rock, defy'd
The baffled spear.

Hoole. *Orlando Furioso*, book x. l. 710.

The perusal of a history seems a calm entertainment; but would be no entertainment at all, did not our hearts beat with correspondent *movements* to those which are described by the historian.

Hume. *Essays*, vol. ii. p. 260. *Enquiry concerning Principles of Morals*, sect. 5.

By *motive*, I mean the whole of that which *moves*, excites or invites the mind to volition, whether that be one thing singly, or many things conjunctly.

Edwards. *On the Freedom of the Will*, part i. sec. 2. p. 7.

MOUGHT, now written *might*; formed regularly from *mow*, (to *may* or be able,) *mowed*, *mow't*, *mout*, *mought*.

Alfrede was eldest, non *mot* his wille withhald.

R. Gloucester, p. 52.

Knoute vnderstode wele, he *mot* not long lyue,
His sonnes in his lyue his londes wild he gyue.

Id. p. 50.

For whan I am there, as she is,
Though she my tales *mought* alowe
Ayene hir will, yet *mote* I bowe

VOL. XXV.

To seche, if that I *might* have grace:
But that thinge maie I not embrace
For ought that I can speake or do;
And yet full ofte I speake so,
That she is wroth, and saith be still.

Gower. *Conf. Am.* book i. p. 27.

And if Jone's wil haue so resolued it,
And such ende set as no wight can fordoe;
Yet at the least assailed *mought* he be
With armes, and warres of hardy nacions;
From the boundes of his kingdom farre exiled.

Surrey. *Virgil. Aeneis*, book iv.

That *mought* perhaps abridge
some part of pinching paine.

Turbervile. *Pindara's Answer to Timetis*.

Where thou *moughtst* chatt with mee thy fill,
And I conferre with thee.

Id. *Ib.*

And ever my flocke was my chiefe care;
Winter or sommer they *mought* well fare.

Spenser. *Shepherd's Calendar*. February.

MOULD, v.

MOULD, n.

MO'ULDY,

MO'ULDINESS.

Kilian has *molen*. Vetus, Fland.
Cariem contrahere.
Skinner suggests the Suio-Goth.
moega, mucor; Fr. *moisi, mucidus*;
or Lat. *mollities*. Minshew from the Fr. *mouille*; and
Tooke forms it immediately from the Fr. *mouillé*,
(*mouilled, mouill'd, mould*,) past participle of *mouiller*,
to wet, to moisten.

To damp; to decay or perish, through moisture or dampness: to decay, to putrify; to form a decayed or putrescent matter (through dampness.)

Shal neuer chest *by molen* it, ne *mough* after byte it.

Piers Plouhman. *Vision*, fol. 71.

This white top writeth min olde yeres;
Min herte is also *mouled* as min heres.

Chaucer. *The Reves Tale*, v. 3867.

And wretched herts have they, that let their tressures *mold*.

Surrey. *Ecclesiastes*, ch. ii.

For the bread *moulet*h if it be kept long, yea and wormes breede in it.

Frith. *Workes*, fol. 117. *Answer to the Preface of M. More's Booke*.

And that their transubstanciated God shulde dwell but .viii. dayes in the boxe for feare of worm eatyng, *mowlynge*, or stynking with such lyke.

Bale. *Englyshe Votaries*, part ii. ch. i.

Ne can the man that *moulds* in ydle cell
Unto her happy mansion attaine.

Spenser. *Faerie Queene*, book ii. can. 3.

PAN. He tells me, madam,

Marriage and *mouldy* cheese will make me tamer.

Beaumont and Fletcher. *The Island Princess*.

And therewithall a few ancient rolles of parchment written long ago, though so defaced with *mouldiness* and rotten for age, that no man could well hold them in his hand without falling into peeces, much less read them by reason of their blindness.

Holinshed. *Description of England*, vol. i. ch. xxiv. p. 365

A dungeon wide and horrible, the walls

On all sides furr'd with *mouldy* damp.

Addison. *Milton's Style imitated out of the IIIId Aeneid*.

His few Greek books a rotten chest contain'd;

Whose covers much of *mouldiness* complain'd.

Dryden. *Juvenal. Satire 3*.

MOULD, v.

MOULD, n.

MO'ULDABLE,

MO'ULDING.

Fr. *mouler, modeler*; It. *modello*;
Sp. *moldar, molde*. (See MODEL.)
To frame or form, to shape, to
forge, to cast, (sc. in or according to
a certain *model*.)

Yf eny mason þer to makede a *molde*

With alle here wyse castes.

Piers Plouhman. *Vision*, p. 223.

2 s

MOUGHT.

MOULD.

MOULD.
—
MOULD-
ER.

My sonne, if thou of suche a *molde*
Art made, now tell me pleine thy shrift.
Gower. Conf. Am. book iv. p. 103.

The smythe comforted the *moulder*, and the ironsmyth the ham-
merman.
Bible, Anno 1551. Esaye, ch. xli.

It is a curiosity to have fruits of divers shapes and figures. This
is easily performed by *moulding* them, when the fruit is young, with
moulds of earth or wood.
Bacon. Natural History, Cent. vi. sec. 502. fol. 107.

The differences of impressible and not impressible; figurable
and not figurable; *mouldable* and not *mouldable*; scissible and not
scissible; and many other passions of matter, are plebeian notions,
applied unto the instruments and uses which men ordinarily practise.
Id. Ib. Cent. ix. sec. 846. fol. 182.

For there was never man without our *molding*,
Without our stamp upon him, and our justice,
Left any thing three ages after him
Good, and his own.

Beaumont and Fletcher. The Woman's Prize, act iii. sc. 3.

He will quickly come to leave his virtue behind him, and to take
the shape and impress of that *mold*, into which such courses and
companies have cast him. *South. Sermons, vol. vi. p. 188.*

B. and Godfrey, of Wood-street, goldsmiths, made the *moulds*,
and cast the images of the king and queen, (still extant in the abbey.)
Walpole. Anecdotes of Painting, vol. i. ch. ii. p. 50.

That ground of your *moulding* is certainly fine,
But the swell of that knoll and those openings are mine.
Whitehead. On the late Improvements at Neunham.

MOULD, *n.* The Lat. *humus*, is *terra madida et*
irrigata, from *βειν*, to wet, to moisten. See HUMBLE.
And *mould*, earth, may be damp or moistened earth.
See MOULD, *ante*. The word *muld*, *mold* exists, how-
ever, in Goth. and A. S.; and in the same language *myld-*
an, *be-myld-an*, is *humare*; D. *be-mull en*; A. S. *myl*;
Flem. *mul*, *pulvis*. Mould is applied to
Ground or earth, and seems distinguished from both
dust and clay.

Ac þe moneye of þis *molde*. þat men so faste kepeþ.
Piers Plouhman. Vision, p. 15.

þer arn mo messhapene among suche beggers
Than of meny oþr men. þat on þis *molde* walken.
Id. Ib. p. 156

And in thei wenten all three
To chambre, where thei might see
The wofullest vpon this *molde*,
Whiche wepte, as she to water sholde.
Gower. Conf. Am. book vii. p. 245.

To whom thus Eve: Adam, earth's hallow d *mould*,
Of God inspir'd, small store will serve, where store,
All seasons, ripe for use, hangs on the stalk.
Milton. Paradise Lost, book v. l. 321.

For like to pillars most they seem'd
Or hollow'd bodies made of oak or firr,
With branches lopt, in wood or mountain fell'd,
Brass, iron, stonie *mould*.
Id. Ib. book vi. l. 576.

MO'ULDER, } See MOULD, *ante*.

MO'ULDERING, } To decompose into *mould* or
earth; to crumble or fall to pieces; to perish by decom-
position into minute particles.

Indeed with the workes of man it is not soe, when he hath em-
ployed about them all the cunning and cost, and care that may be,
he can neither preserve them nor himselfe, both they and hee
moulder away and returne to their dust.

Hakewill. Apologie, ch. ii. sec. 2. fol. 18.

The ninth [means to induce and accelerate putrefaction] is by
the interchange of heat and cold, or wet and dry; as we see in the
mouldering of earth in fros's and sunne.

Bacon. Natural History, Cent. iv. sec. 337. fol. 74.

Thus the ideas, as well as children, of our youth, often die before
us; and our minds represent to us those tombs, to which we are

approaching; where the brass and marble remain, yet the inscrip-
tions are effaced by time, and the imagery *moulders* away.

Locke. Of Human Understanding, book ii. ch. x.

As the whole transaction was miraculous, it was just as easy to
Omnipotence to restore life and form to a body *mouldered* into dust,
as to reanimate a body that was preserved uncorrupted and entire.

Porteus. Lecture 15. vol. ii. p. 53.

MOULT, *i. e.* to *mute* or change, *sc.* their feathers.
See to MEW. Low Lat. *mula* is applied to the disease
felt by birds when changing their feathers.

So shall my anticipation preuent your discovery (and) your
secrecie to the king and queene, *moult* no feather.

Shakspeare. Hamlet, fol. 262.

Some birds there be, that upon their *moulting* do turn colour; as
robin-redbreasts, after their *moulting*, grow to be red again by de-
grees; so do goldfinches upon the head.

Bacon. Natural History, Cent. ix. sec. 851.

With cord and canvas, from rich Hamburgh sent,
His navy's *molted* wings he imps once more.

Dryden. Annus Mirabilis.

I see the soul in pensive fit

And moping like sick linnet sit,

With dewy eye and *moulting* wing,

Unpearcht, averse to fly or sing. *Green. The Grotto.*

MOUN. See MOWE.

MOUND, *v.* } A. S. *mund*, *septum*, perhaps from

MOUND, *n.* } A. S. *mund-ian*, *tueri*, *protegere*; to

defend or protect: but it seems more probably to be a
mount, or something raised, *sc.* as a fence, or defence.
The A. S. *mund-ian* is merely a consequential usage of
mynd-ian, to mind. To *mound*,
To raise, *sc.* a fence or defence.

We'll rob the brim of ev'ry fountain,
Strip the sweets from ev'ry mountain,
We will sweep the curled vallies
Brush the banks that *mound* our alleys.

Drayton. The Muses' Elysium. Nymphal 3.

The warlike elfe much wondred at this tree,
So fayre and great, that shadow'd all the ground;
And his broad braunches, laden with rich fee,
Did stretch themselves without the utmost bound,
Of this great garden, compast with a *mound*.

Spenser. Faerie Queene, book ii. can. 7.

In elder days ere yet the Roman bands
Victorious, this our other world subdued,
A spacious city stood, with firmest walls
Sure *mounded* and with numerous turrets crown'd.

J. Philips. Cider, book i.

When swift the signal given,
They start away and sweep the massy *mound*
That runs around the hill, the rampart once
Of iron war, in ancient barbarous times.

Thomson. Spring.

MOUNT, *v.*

MOUNT, *n.*

MO'UNTAIN,

MO'UNTAINED,

MO'UNTAINER,

MO'UNTAINET,

MO'UNTAINOUS,

MO'UNTANT,

MO'UNTENANCE,

MO'UNTER,

MO'UNTING, *n.*

MO'UNTINGLY,

MO'UNTLET,

MO'UNTURE,

MO'UNTY,

MO'UNTEBANK,

MO'UNTEBANKERY.

Fr. *monter*, *mont*, *montaigne*;

It. *montare*, *monte*, *montagna*;

Sp. *montar*, *monte*, *montana*,

from the Lat *mons*; which Sca-

liger thinks is ἀπὸ τῆς μένειν,

that is, *manendo*, whose preter-

perfect is μέμνηται, whence μένος,

qui remansit solus, and from

μόνος, mons, quia permanet,

nec loco movetur, because it re-

mains, and is not removed from

its place. Mount, the noun, is

A raised or elevated place,

raised ground.

To *mount*; to rise, to raise,

to elevate, to ascend, climb,

come or go up. See to AMOUNT.

Mountance, mountenance; the amount or sum, the
height.

MOULD-
ER.
—
MOUNT.

MOUNT. Mountebank, It. *montimbanco*, *montare in banco*, one who *mounts* upon a bench, sc. for some purpose of quackery; hence a quack, a clamorous pretender or boaster.

And vorto passy þe mouns.
R. Gloucester, p. 220.

Of montaynes hii come adoun.
Id. p. 407.

Isaac had a spie, þat warned him ay befor,
To tak þe mountayn hie, & bide þer tille þe morn.
R. Brunne, p. 160.

He sat in the mount of Olyves agens the temple.
Wiclif. Mark, ch. xiii.

And as he sate on moūt Olyuete, ouer agaynste the temple.
Bible, Anno 1551.

— And let the reynes gone
Of his horse, and they anone
Soone up to mount, and doun discende.
Chaucer. The House of Fame, book iii. p. 352.

Of all the remenant of min other care
Ne set I not the mountance of a tare,
So that I could don ought to your plesance.
Id. The Knightes Tale, v. 1572.

But the anguishous loue of hauyng in folke burneth more cruelly,
than the mountain of Ethna, that aie brenneth.
Id. Boecius, book ii. p. 419.

The water is euer fresh and new
That welmeth vp with waues bright
The mountenance of two finger hight.
Id. The Romant of the Rose, p. 182.

And with his hoste the waie hath take
Ouer the mountes of Lumbardie.
Gower. Conf. Am. Prologue, p. 13.

As he [Tiresias] walkend goth par cas
Upon an highe mountaine, he sigh
Two serpentes in his weye nighe.
Id. Ib. book iii. p. 75.

And I bode in the place stille,
And was there but a litell while,
Not full the mountance of a mile.
Id. Ib. book viii. p. 268.

And then what a madnesse is it for the poore pleasure of your
worldly goods for so fewe yeares, to caste youre selfe both bodye
and soule, into the euerlastyng fyre of hell, whereof there is not
mynished the mountenance of a moment.
Sir Thomas More. Workes, fol. 1231. A Dialogue of Comfort
against Tribulacion.

The mounture so well made, and for my pitch so fit,
As though I see faire peeces moe, yet few so fine as it.
Gascoigne. Weeds. The Complaint of the Greene Knight.

When he was readie to his steede to mount
Unto his way, which now was all his care and court.
Spenser. Faerie Queene, book v. can. 10.

She had not rid the mountenance of a flight,
But that she saw there present in her sight
Those two false brethren on that perilous bridge.
Id. Ib. book v. can. 6.

When the ancient generals spake to their armies, they had ever a
mount of turfe cast up where upon they stood.
Bacon. Natural History, Cent. iii. sec. 205.

— Hold vp, you sluts,
Your aprons mountant.
Shakspeare. Timon of Athens, fol. 91.

This Cleon was a mountaineer,
And of the wilder kind.
Drayton. The Muses' Elysium. Nymphal 2.

Those snowy mountlets, through which do creep
The milky rivers that are inly bred
In silver cisterns.
P. Fletcher. Christ's Victory and Triumph.

Betwixt her breasts (which sweetly rose up like two fair moun-
tainets in the pleasant vale of Tempe) there hung a very rich dia-
mond set but in a black horn.
Sidney. Arcadia, book i.

And tho' they to the earth were thrown,
Yet quickly they regain'd their own;
Such nimbleness was never shown,
They were two gallant mounters.

Drayton. Nymphidia. The Court of Fairy.

From 'this [Tarrace] the beholder descending many steps, was
afterwards conveyed again by several mountings and valings to
various entertainments of his sent and sight.

Reliquiae Wottonianæ, p. 64. Architecture.

The sport which for that day Basilius would principally show to
Zelmane, was the mounty of a hearn, which got up on his waggling
wings with pain, till he was come to some height as though the air
next to the earth were not fit for his great body to fly through.

Sidney. Arcadia, book i.

— But leap'd for joy
So mountingly, I touch'd the stars, methought.
Massinger. Old Law, act ii. sc. 1.

Most writers agree that Portus was four cubits and a shaft length
high, and that being upon an elephant's back he wanted nothing in
hight and bigness to be proportionable for his mounture, albeit it
were a very great elephant.

Sir Thomas North. Plutarch, fol. 584. Alexander the Great.

Stares like a mountebank who had forgot
His viol, and the cursed poyson took
By dire mistake before his antidote.

Davenant. Gondibert, book iii. can. 6.

POL. Fellowes, to mounte a banke! Did your instructor
In the deare tongues, never discourse to you
Of the Italian mountebanks?

Ben Jonson. The Fox, act ii. sc. 2.

This of purifying, the only true expedient (is) yet untried (whilst
all others are experimented to be but mere empirical state mounte-
bankery.)

Hammond. Works, vol. iv. fol. 509. Sermon 6.

— Who from the Saxons' power
Themselves in deserts, creeks, and mount'nous wastes bestow'd.
Drayton. Poly-olbion, song 5.

Behold yon mountain's hoary height
Made higher with new mounts of snow,
Again behold the winter's weight
Oppress the labouring woods below.
Dryden. Horace. Ode 29. book iii.

When Giant Vice and Irreligion rise
On mountain'd falsehoods to invade the skies:
Then warmer numbers glow through Satire's page,
And all her smiles are darken'd into rage.
Brown. Essayon Satire.

— The sturdy mountaineers
Who saw their mightiest fall'n, and in his fall
Their honours past impair'd.
Somerville. Hobbino!, can. 2.

But as there are certain mountebanks and quacks in physick, so
there are much the same also in divinity.

South. Sermons, vol. iv. p. 29.

Freed from the confines of her Gothic grave,
When her first light reviving Science gave,
Alike o'er Britain shone the liberal ray
From Ensworth's mountains to the banks of Tay.

Langhorne. Genius and Valour.

The willow's grateful to the pregnant ewes,
Showers to the corns, to kids the mountain-brouse.
Beattie. Pastoral 3.

When ridgy seas, by hurricanes uptorn,
In mountainous commotion dash between,
And either deck, in black'ning tempests veil'd,
Waft from its distant foe.

Glover. Leonidas, book xii.

MOURN, v. } Goth. mawrnan; A. S. murn-
MO'URNER, } an; Ger. murren, mœrere, to
MO'URNFUL, } grieve; the Fr. morne, grieved,
MO'URNFULLY, } Menage derives from the Lat.
MO'URNFULNESS, } mors.
MO'URNING, } To grieve, to lament, to bewail,
MO'URNINGLY. } to sorrow.
2 s 2

MOUNT.
MOURN.

MOURN.

Ac þe kýng of Engelond, in such sor & mournynge,
Carede of ys gonge sones mest of alle þynge.
R. Gloucester, p. 299.

Of his body was no force, non for him wild murne.
R. Brunne, p. 20.

Sir Ode herd þat tiping, fulle mournand was his chere.
Id. p. 94.

Thanne morned Mede. meuýng hure to þe kyng
To have space to speke.
Piers Plouhman. Vision, p. 49.

Blessid ben thei that mournen : for thei schal be counfortid.
Wiclif. Matthew, ch. v.

Blessid are they that mourne : for they shall be cōforted.
Bible, Anno 1551.

I seie to ghou that ghe shulen morene and wepe, but the world
schal haue ioie.
Id. John, ch. xvi.

I ne had al vterlye foreleten the wepinge and the mourninge that
was sette in min herte.
Chaucer. Boecius, book iv. p. 435.

About my heauy hearse, some mourners would I haue,
Who might the same accompany and stand about the graue.
Gascoigne. Dan Bartholmew of Bathe.

Yet cannot she rejoyce,
Nor frame one warbling note to pass, out of her mournfull voyce.
Id. Flowers. The Lamentation of a Louer.

Henceforth his ghost, freed from repining strife,
In peace may passen over Lethe lake ;
When mourning altars, purg'd with enemies life,
The black infernall furies doen aslake.
Spenser. Faerie Queene, book i. can. 3.

And by the lights as they along were led,
Their shadows then from following at their back,
Were like to mourners carrying forth their dead.
Drayton. The Barons' Wars, book vi.

Yet seem'd she to appease
Her mournfull plaintes.
Spenser. Faerie Queene, book i. can. 1.

Beate thou the drumme that it speake mournfully.
Shakspeare. Coriolanus, fol. 30.

Or when me list my slender pipe to raise,
Sing of Eliza's fixed mournfulness,
And much bewail such woeful heaviness.
P. Fletcher. To my Cousin, W. R. Esq.

But when my mournings I do think upon
My wormwood, hemloc, and affliction ;
My soul is humbled in rememb'ring this.
Donne. The Lamentations of Jeremy, ch. iii.

LAF. He was excellent indeed, madam, the king very latelie spoke
of him admiringly, and mourningly.
Shakspeare. All's Well that Ends Well, fol. 230.

Reluctant now I touch the trembling string,
Bereft of him who taught me how to sing ;
And these sad accents, murmur'd o'er his urn,
Betray that absence they attempt to mourn.
Tickel. On the Death of Mr. Addison.

Yet if he steps forth with a Friday look, and a lenten face, with
a blessed Jesu, a mournful ditty for the vices of the times ; oh !
then he is a saint upon earth ; an Ambrose or an Augustine.
South. Sermons, vol. vi. p. 96.

As the apostle says of circumcision and uncircumcision, so say I
here, that neither mourning for sin, or confession of it, avail any
thing but a new creature.
Id. Ib. vol. vii. p. 129.

Her pinions ruffle, and low dropping, scarce
Can bear the mourner to the poplar shade ;
Where all abandon'd to despair, she sings
Her sorrows through the night.
Thomson. Spring.

No more thy soothing voice my anguish cheers ;
Thy placid eyes with smiles no longer glow,
My hopes to cherish, and allay my fears.
'Tis meet that I should mourn : flow forth afresh, my tears.
Beattie. The Minstrel, book ii.

MOUSE, v. } In A. S. *mus* ; Ger. *mausen*, *maus* ; MOUSE.
MOUSE, n. } D. *muysen*, *muys* ; Sw. *mus* ; Lat. —
MO'USER. } *mus* ; Gr. *μῦς* ; perhaps from *μύειν*, MOUTH.
abdere, to hide. To mouse,
To watch or lie on the watch, to catch, to devour ; sc.
as a cat does *mice*.

And many mannys malt. we myes wolde destrye.
Piers Plouhman. Vision, p. 11.

Now, if thou sawe a mouse, among other *mice*, that chalenged to
hym selfward, right and power over all other *mice*, how greate
scorne wouldest thou haue of it ?

Chaucer. Boecius, book ii. p. 419.

What maie the mous ayen the cat.
Gower. Conf. Am. book iii. p. 84.

OLD MAN. 'Tis vnnaturall,
Euen like the deed that's done : on Tuesday last,
A falcon tow'ring in her pride of place,
Was by a mowsing owle hawk't at, and kill'd.
Shakspeare. Macbeth, fol. 138.

O' th' tother side, the pollicie of those craftie swearing rascalls ;
that stale old mouse-eaten dry cheese, Nestor.
Id. Troylus and Creseide, fol. 103.

LA. I—you haue bin a mouse-hunt in your time
But I will watch you from such watching now.
Id. Romeo and Juliet, fol. 72.

Valour's a mouse-trap, Wit a gin,
Which women oft are taken in.
Butler. Hudibras, part ii. can. 3.

For some men sain, "In muchel suffring shul many thinges
falle unto thee, which thou shalte not *mowe* suffre."

Id. The Tale of Melibeus, p. 114.

But that science is so far us beforne,
We *mowen* not, although we had it sworne,
It overtake, it slit away so fast.

Id. The Chanones Yemannes Tale, v. 16148.

Mow, n. corrupted from *mouth*; Fr. *moue*, a *moe*, or
mouth. Cotgrave.

And whan a wight is from her whele ithrow,
Than laugheth she [Fortune] and maketh him the *mowe*.

Chaucer. Troilus and Creseide, book iv. st. 1.

Yea the very lame come together agaynst me vnawares, makinge
mowes at me, and ceasse not.

Bible, Anno 1551. Psalm 35.

What helpeth it also that the priest whē he goeth to masse dis-
guiseth him selfe with a great part of the passion of Christ, and
playeth out the rest vnder silence with signs and profers, with
noddying, bekyng and *mowyng*, as it were Jacke an apes, when
neither he himselfe neither any man els woteth what he meaneth.

Tyndall. Workes, fol. 123. The Obedience of a Christian Man.

For euery trifle, are they set vpon me,
Sometime like apes, that *moe* and chatter at me,
And after bite me.

Shakspeare. Tempest, fol. 9.

MOZAMBIQUE, or rather **MOSAMBIK**,* is a small Position,
Island at the mouth of a bay which forms one of the &c.
most secure harbours on the South-Eastern coast of
Africa, and gives its name to the channel separating
that Continent from Madagascar, at one end of which it
lies. The position of this Island and the strength of its
Fort, have long made it the head-quarters of the Por-
tuguese establishments on this coast. In shape it is
an oblong slightly curved, with its concave side turned
towards Madagascar; nearly in the centre of its oppo-
site or convex side, which is turned towards the har-
bour, is the town extending about one mile in length,
and a quarter of a mile in breadth. The Governor's
house, and the church, its most conspicuous buildings,
are near the landing-place, which is rendered very com-
modious by steps carried out on either side of a pier
built on arches, (Salt, 22.) but much dilapidated when
seen by Mr. Salt in 1809. It was then, however, about
to be repaired. The Fort at the North-Eastern extremity
of the Island, in 15° 1' South and 40° 41' 48" East,
(Owen's Tables,) is well placed. It is octangular, and
has six bastions mounted with eighty pieces of ordnance,
and was begun in A. D. 1507. The harbour is formed
by a projecting point of land called S. Cúl on the
South-West, and the small peninsula called Cabaceiro
(Gourd) on the North-West, by each of which the
Island of Mosambik is supplied with provisions; for as
it is only about two miles and a half long, and half a
mile broad, it is incapable of producing a sufficient

* Moçambique, according to most Portuguese writers; some-
times spelt Mozambique, *ç* and *z* being exactly equivalent. The
Arabs write *Mosabij*, if Fr. Joaõ de Sousa (*Dec. Arab.* 46. 70. 85.)
read his MSS. rightly; which may perhaps be doubted, as M. De
Sacy (*Mémoires de l'Institut*) in his transcript of an Arabic inscrip-
tion, by no means difficult to read, detected most extraordinary
errors.

MOW.

Commerce.

supply for its inhabitants. On the Southern side of Cabaceiro, about three leagues from the town of Mosambik, is the village of Mesuril, where the Governor has a country seat, the appearance of which from the water is extremely beautiful. (Salt, 28.) It is placed on a rather steep bank and approached by flights of steps, leading through groves of lemons, oranges, citrons, and papaws, having rising grounds behind, covered with a thick forest of cocoa, cashew nuts, mangoes, and other lofty trees. The peninsula of Cabaceiro, on which it stands, about eleven miles long and four broad, is connected with the main land by an isthmus, measuring about a mile across, and called Sorcé Souâh, "an Arabic term,"* says Mr. Salt, "importing the approximation of the sea on the two sides." Unfortunately the creek on the Southern side of the isthmus is dry at low water, and leaves a line of nearly four miles in extent open to attack, being ill protected by an old dilapidated fort near the village. The soil of this peninsula is fertile, but imperfectly cultivated; and the natural indolence of the settlers is fostered by their continual apprehension of an attack from the Savages in their neighbourhood: for so inefficient is the regular force maintained by the Portuguese Government, that the colonists depend chiefly for support, in case of invasion, on the Sheikhs of Quintangone, (Kintangonya,) S. Cûl, and Sereïma, who are either nominated by the Governor of Mosambik, or in strict alliance with him.

The planters are, consequently, at a very low ebb with regard to wealth or civilization. Cocoa-nuts and manioc are almost the sole productions cultivated, the slave-trade being the only considerable branch of commerce. The whole fixed population, exclusive of slaves, does not exceed 500 families: but there are many mariners of Arab descent, and Banians (Vaniyâs) from India, who are artisans or petty traders, and excellent goldsmiths. These classes may amount to about 800, and the free Negroes and native soldiers may be estimated at 1500, so that the sum total of the inhabitants immediately under the Governor's authority may be nearly 5000. The improvident and immoral habits of the Europeans sent out as settlers, or Civil servants, soon destroy their health, and render them unfit for service; and it is said, that in the space of five years not more than seven out of one hundred survive; so that any enterprising intelligent Chief, either in Arabia or Madagascar, might easily drive the Portuguese from these settlements. The vigilance of the English cruisers in the Indian Ocean has also, no doubt, given a severe blow to the slave-trade, so that the colony is now probably in a still more declining state than in 1809. An able-bodied male slave then sold for about £5, and above 4000 were said to be exported annually, each paying 16½ crusados duty. (about 20s.) The trade with India, consisting of gold, ivory, and slaves, is the most lucrative; Indian piece-goods, tea, spices, &c., are received in return. Scarcely any thing but slaves is exported to Brazil and Spanish America, for whom specie alone is paid. Captain Weatherhead, with whom Mr. Salt sailed, was of opinion, "that a small cargo might be disposed of to advantage in the months of April, May, and June; the articles most suitable being iron in bars, lead, powder, shot, iron-hoops, cutlery, stationery, prints, and framed pictures, a small quantity of household furni-

* Probably *Sau'es-suwâh*, "the separation of the mud," i. e. having mud on both sides.

ture, printed cottons, silk and cotton stockings, shoes and boots, waistcoat-pieces, light, plain muslins, blue cloth, a few telescopes, salt butter, hams, and cheese; in short a little of every article necessary for comfort, in use among the Portuguese." (Salt, 81.)

The Governor is assisted by a Council consisting of three persons, the Bishop, Minister, and Military Commander. The official salary of the Governor is 12,000 cruzados, (£750,) that of the Bishop 1500 cruzados, (£92,) annually, and of the inferior officers in proportion, yet the wages of the Governor's cook amount to more than treble the pay of a Captain. (720 cruzados = £90.) This alone must act as a sort of bounty on peculation; and when it is considered that most of the soldiers and Civil inhabitants have been transported from the mother country as convicts, the real state of the colony, moral and political, may be easily conjectured. The sovereignty of the Portuguese, which, as has been already shown in the account of the Manamotapa's dominions, scarcely extended, where most flourishing, beyond the banks of the Zambeze, is now restricted to the course of that stream as far as the Forts of Tête, in the interior, and to the line of coast between Cape Delgado (10° 41' 12" South and 40° 34' 36" East) and Cape Corrientes, (24° 7' 30" South and 35° 25' 24" East,) comprehending an interval of more than 13°. (786 miles.) They have forts at that cape, Inyambâne, (Inhambano, in 23° 51' 42" South, 35° 19' 42" East,) and Sofalah, (20° 10' 42" South, 34° 40' 54" East,) from the former of which much ivory is brought, and from the latter very excellent rice, (Salt, 27.) its low, muddy beach being covered with mangroves (*Rhizophora gymnorhiza*) and Bruce's Rack, (Arák; *Avicennia tomentosa*), which grows in the water and abounds on all this coast of Africa. (Salt, 13, 14.) At the mouth of the Luabo, at Isla do Fogo, (Fire Island,) the Islas da Angoxa, (Anguish Islands, off Angoxa Point, in 16° 24' 36" South and 39° 51' 18" East,) and Querimba, (Kerimba, 12° 23' 42" South, 40° 33' 48" East,) there are forts and very small establishments belonging to Portugal still kept up, chiefly on account of her territories in India, which are supplied from them with slaves.

Of the natives in the interior, little is known beyond what was learned by Mr. Salt, and the brief notices collected by the late Mr. Bowdich. (*Account of the Discoveries of the Portuguese in Angola and Mozambique*.) "The Makúa or Makúána, as they are often called," says the former, (37.) "comprise a People consisting of a number of very powerful Tribes lying behind Mozambique, which extend Northward as far as Melinda, and Southward to the mouth of the River Zambezi; while hordes of the same nation are to be found in a South-West direction, perhaps almost to the neighbourhood of the Kaffers bordering on the Cape of Good Hope. A late traveller in that settlement mentions them as a Tribe of Kaffers, and says the name is derived from the Arabic Language, signifying 'workers in iron.'" Lichtenstein, the traveller to whom Mr. Salt here alludes, justly inferred from comparing his own observations (i. 393.) with the accounts found in the old Portuguese writers, that these Tribes all belong to the same stock; but his far-fetched and (as might be easily shown) inadmissible derivation of their name Macquini (not Mekúa) from the Arabic, (i. 496.) was alleged in support of another theory, viz. that the Káfirs are not connected with Tribes of the Negro race, and it is not certain that

guese do-
minion.

Natives.

Maccoa,
Macaoane.

MOZAMBIQUE. he was speaking of the Makuáns. If he were so, his latter position is proved to be erroneous by Mr. Salt's description of that People. The term makúa, moreover, is common to the Languages of Congo and Angola, as well as to those of the Countries on the Western side of the Continent, and signifies "native;" thus we see Macuas, or by error of the engraver Macaus, marked on D'Anville's Map of Africa, near the Querimba Islands, and on Bowdich's Maps (p. 86.) North-East of the Zambeze river. It seems also used for any "native" of a different Tribe or Nation. The short Vocabularies of the Makúa and Monjú* given by Mr. Salt, (*Travels, Append. No. I. p. 507.*) show that they are dialects of the same Language, but present at first sight few points of coincidence with the Béchúána and Kósa (Lichtenstein, i. 641. ii. 620.) Languages, but when compared with those of the Choambo who border on the Makúas, the Matibáns, neighbours of the Inyambanyas, (Inhambane,) and the Masanja, whod well to the North-East of Bengéla, the intermediate links of the chain are found, and the affinity of all these Languages can no longer be doubtful. The following words, compared with those corresponding with them in the Loanguese and its cognate dialects, (xxiv. 516.) will serve to illustrate this remarkable fact.

Monjou.

	Makúa.	Monjú.	Choambo.	Matibani.	Kausa.	Masanja.
Man,	mo-lume	mo-lopanah	—	lum-to	—	—
Father,	té-té	até-até	—	diti	—	mukuha
Mother,	mama	a-mavo	mama	mama	uma	—
Sun,	ezúa	júva	chúa	uzúa	izulu (sky)	—
Moon,	maré	muézé	moépa	maépa	inyanga	moézhf
Water,	mazi	mézi	mazi	mazi	am-mansi	menya
Fire,	murro	moto	moto	murro	—	—
Eye,	meto	mezo	mazho	meta	—	—
Head,	múru	mutúwe	solo	murro	—	mutua
Mouth,	yanu	únwa	mu-kamayano	—	—	kano
Eat,	u-ria	ku-lía	—	ia	—	—
Drink,	ghu-ria	kha-nua	—	noa	—	—

The numerals of the Sowáli, a maritime Tribe, occupying the coast from Magadashó (Magadoxo) to Monbasah, (Mombaza,) and speaking another dialect of this Language, have a close affinity with those of the Matibani:

Sowáli.	Matibáni.
1. Che-móje	moza
2. Ma-biri	pili
3. Ma-dátu	taru (tatu?)
4. Mu-chéche	tezhe
5. Mánu	tana
6. Fanjáte	tana moza
7. Ma-kendé	tana pili
8. Ma-náni	tana taru
9. Komi†	loko
10. Móje	loko na kezhe.

Most of the native soldiers at Mosambík are by birth Makúas; they are a strong, athletic race of people, who fight with spears, darts, and poisoned arrows, or muskets procured from the Arabs. The ferocity of their appearance is greatly augmented by the deformity of their

* Perhaps Monjáti, for Mr. Salt forgot to tell his readers whether it is the *ou* of *you* or *thou*, which he meant to express in *Monjou*.

† In the latter numbers there is probably an error, as *kumi* signifies 10 in most of these dialects; and from *khúmi*, the guttural is softened into *sh* (*shúme*) in the Béchúána, as the hard *c* of *carus*, *carbo*, *caritas* was gutturalized in the Middle Ages, and finally changed into *ch* (*i. e. sh*) in the French words *cher*, *charbon*, *charité*.

visage. (Salt. 40.) They often tattoo their skins so roughly as to raise the marks an eighth of an inch above the surface. An indented line down the forehead, and along the nose, crossed by another from ear to ear, is the most common embellishment; and their teeth are filed so as to appear like a coarse saw. They also shave their heads in various fantastic fashions, and suspend copper or bone trinkets from a hole in the gristle of the nose. The women increase the natural protuberance of the upper lip by piercing it, and inserting a bit of wood or ivory in the opening. They are docile and serviceable as slaves; fond of music and dancing, and play on the *ambira*, a kind of steccato formed of slender iron bars of different lengths, highly tempered, placed over a hollow case of wood, and struck with a quill: the notes, which are very simple, are not devoid of harmony. The Monjúas, who, according to the accounts received by Mr. Salt, (32.) cannot be more than 600 or 700 miles from the coast of Mosambík, probably in a North-Easterly direction, were acquainted with other traders called Evízi and Maravi,* "who had travelled far enough inland to see large waters, white people, and horses:" of which latter animal the Monjúas have a great dread. The Monjúas are extremely ugly, having high cheek-bones, thick lips, small knots of woolly hair like pepper-corns on their heads, and skins of a deep shining black. Their bows are extremely simple; their arrows long, barbed, and poisoned. Two pieces of hard wood, for kindling fire by friction, are always carried about their persons. They are fond of dancing. The men begin first, and some of the women beat the tom-toms, while others clap and sing. Subsequently the women join the men, and all dance together in a circle, beating time very exactly with their feet. It appeared to Mr. Salt that the slaves were often compelled to dance. "I shall never forget," he adds, (34.) "the expression of one woman's countenance, who had lately, I understood, been brought from the interior. She was young, and appeared to have been a mother, and when constrained to move in the circle, the solemn gloom that pervaded her features, spoke more forcibly than any language the misery of her forlorn condition."

The Natural History of this part of Africa is still very imperfectly known; several rare birds are mentioned by Mr. Salt. (30. 31.) The sucking-fish (nearly resembling the *Echineis neucrates*, (Shaw, *Zool. iv. l.*) used by the natives in catching turtles; the hammer-oyster, said to contain valuable pearls, and the vast variety of fish found in the adjoining sea, are also noticed by him. "I never," he says, (51.) "met with so great a variety of sea-productions on any other coast. The star-fish and sea-flowers were particularly beautiful, and of many exquisite colours; sponges too of several curious sorts were common, and the sand was besides loaded with muscles, crabs, and other shell-fish; while, in the shallow water, various species of sea priapi were found, and different sorts of mollusca, which dissolved on being exposed to the sun, or when immersed in spirits." To the Botanist also this Country is no less interesting. Loureiro, in his *Flora*, has enumerated no less than forty-four new plants, some of them undoubtedly new genera, which he found during a residence at Mozambik of only three months; and Mr. Salt especially notices the *Malumpara*, doubtless the *Mulambeira* of Loureiro, a new species, or perhaps only a variety of the hab-

But he ne left nought for no rain ne thonder,
In sikenesse and in mischief to visite
The ferrest in his parish, *moche* and lite,
Upon his fete, and in his hand a staf.

Chaucer. Prologue to the *Canterbury Tales*, v. 496.

Thou shalt be wedded unto on of tho,
That han for thee so *mochel* care and wo.

Id. The *Knights Tale*, v. 2354.

"Tell me what that ye seken by your fay.

Peraventure it may the better be:

Thise olde folk con *mochel* thing," quod she.

Id. The *Wif of Bathes Tale*, v. 6586.

He was of suche surquedrie,
That he through his chiuallrie
Upon hymselfe so *mochell* truste,
That to the gods him ne luste
In no quarell to beseche.

Gower. Conf. Am. book i. p. 32.

Phedra, the whiche hir sister is,
He toke instede of hir, and this
Fell afterwarde to *mekell* tene
For thilke vice, of whiche I meane.

Id. Ib. book v. p. 164.

Mean while revive;

Abandon fear: to strength and counsel join'd
Think nothing hard, *much* less to be despair'd.

Milton. *Paradise Lost*, book vi. l. 495.

* Hhab-Hhab, apparently an African word, is the Arabian name of the *Adansonia*, whence by errors of transcription, Alpinus, or more probably his printers and amanuenses, formed the barbarous term *Baobab*, adopted by Adanson, who delighted in such uncouth denominations.

So *much* the more
His wonder was to find unwak'nd Eve
With tresses discompos'd, and glowing cheek,
As through unquiet rest.

Milton. *Paradise Lost*, book v. l. 8.

In humble dales is footing fast,
The trode is not so tickle,
And though one fall through heedless haste,
Yet is his misse not *mickle*.

Spenser. *Shepherd's Calendar*. July.

And all this tract that fronts the falling sun
A noble peer of *mickle* trust and power
Has in his charge, with temper'd awe to guide
An old and haughty nation proud in arms.

Milton. *Comus*, l. 31.

Then sighing oft; "I learn that little sweet
Oft tempred is," quoth she, "with *muchell* smart."

Spenser. *Faerie Queene*, book i. can. 4.

Thus far my charity this path has try'd;
A *much* unskilful, but well-meaning guide.

Dryden. *Religio Laici*.

If after all they stand suspected still,
For no man's faith depends upon his will;
'Tis some relief, that points not clearly known
Without *much* hazard may be let alone.

Id. Ib.

"Twere well, could we permit the world to live
As the world pleases: what's the world to you?"

Much. I was born of woman, and drew milk
As sweet as charity from human breasts.

I think, articulate, I laugh, and weep,
And exercise all functions of a man.

Cowper. *The Task*, book iii.

MU'CILAGE, } Fr. *mucilage*; It. *mucilage*,
MUCILA'GINOUS. } from the Lat. *mucus*, and that
from *mungere*, to wipe. See to SNITE.

As the Fr. *mucilage*, "Slime; or a slimy liquor drawn from seeds, roots, &c., and thence, a clammy sap, glewie juice, cleaving moisture." Cotgrave.

Dissolution of gum tragacanth, and oil of sweet almonds, do not commingle the oil remaining on the top till they be stirred and make the *mucilage* somewhat more liquid.

Bacon. *Works*, vol. i. p. 424. *Physiological Remains*.

ii. There is a sort of magnetism, not only in amber but in jett; as is known; but also in gumm anime, gumm elemy, and in all other, not *mucilaginous*, but resinous gums, even in common rosin itself.

Grew. *Cosmo Sacra*, book i. ch. ii. fol. 12.

Then grate it on a grater which has no bottom, that so it may pass thro', like a *mucilage*, into a dish of earthenware.

Evelyn. *Miscellaneous Writings*, p. 752. *Acetaria*.

MUCK, *n.*

MUCK, *v.*

MU'CKY,

MU'CKENDER.

JUNIUS derives from A. S. *meox*, a *mixen*, *q. v.* Skinner is in doubt. Tooke considers *muck* to be past tense and past participle of the A. S. *mic-jan*, *meiere*, *mingere*, and to mean any thing *staled* upon. The hay, straw, &c. *staled upon* by cattle make the *muck-heap*.

To *muck* is to cover with, to spread over with *muck*.

Muck is applied, met. to dirt, rubbish, dross, pelf.

For he was grutchende euermore,
There was with hym none other fare,
But for to pinche, and for to spare,
Of worldes *mucke* to gette encres.

Gower. Conf. Am. book vi. p. 160

But if he gather'd roote amongst his feeres,
And light on lande that was well *muckte* in deede,
Then stands it still, or leaues increase of seede.

Gascoigne. *Gardenings*.

Who so gladly halseth the golden meane,
Voide of daungers advis'dly hath his home
Not with lothsome *muck*, as a den uncleane
Nor palace like, wherat disdain may glome.

Surrey. *Praise of Meane and Constant Estate*.

MUCH.
—
MUCK.

MUCK.

But minds of mortall men are *muckell* mard
And mov'd amisse with massy *muckes* unmeet regard.
Spenser. Faerie Queene, book iii. can. 10.

And money is like *mucke*, not good except it be spread.
Bacon. Essay 15. p. 85.

The first that devised *mucking* of grounds, was (by report)
Augeas, a king in Greece: but Hercules divulged the practice
thereof among the Italians.

Holland. Plinie, book xxvii. ch. ix.

You knew her little and when her

Apron was but a *muckender*.

On Dr. Corbet's Marriage, (from *Wit Restor'd*, 1658.)

But all his mind is set on *mucky* pelfe.

Spenser. Faerie Queene, book iii. can. 9.

Oh Mediocrity,

Thou priceless jewell, only mean men have

But cannot value; like the precious jem

Found in the *muckhill* by the ignorant cock.

Beaumont and Fletcher. The Queen of Corinth, act iii. sc. 1.

Each *muck-worme* will be rich with lawless gaine,

Altho' he smother up mowes of seven years graine,

And hang'd himselfe when corn grows cheap again.

Hall. Satire 6. book iv.

Ah! Gaffer Pestel, what brave days were those

When higher than our house our *muck-hill* rose!

Jago. The Scavengers.

Me (humbler lot!) let blameless bliss engage,

Free from the noble mob's ambitious strife,

Free from the *muck-worm* miser's lucrous rage,

In calm contentment's cottag'd vale of life.

Cooper. The Tomb of Shakspeare.

Extent.

MUCK, (in Gaelic *Eilean nan muchd*, or Isle of Swine,) a small Island of the Hebrides, forms a group in conjunction with Rum, Canna, and Eigg. It is two miles long, and on an average one broad. Its extent is not sufficient to allow the formation of any streams, but the want of them is supplied by numerous springs. Its surface is undulated throughout, and presents in every part the rocky faces of the basaltic terraces which constitute these irregularities. There is but one hill, situated on the Western extremity of the Island, and attaining a height of 600 feet. The shores are in general low and rocky, but rise to the Westward into cliffs about 50 or 60 feet high. Of the trap which constitutes the great mass of the Island, the predominant varieties are basalt and fine green-stone. These have sometimes an indistinct columnar tendency, more commonly they are amorphous. The only exception to the universality of trap is to be found at the Bay of Camusmore. A series of stratified rocks there comes into view, of which, however, but a very small portion is accessible, as the strata do not reach many feet above low-water mark. They consist of different beds of sandstone and limestone, of which the former are the uppermost and greatest in quantity, and are calcareous and of a white colour. The limestone verges from blackish blue to pale grey and dove colour, becoming nearly white on the surface by the action of the sea. Some parts contain the remains of shells, others have a fine granular texture, and others have a conchoidal fracture, with the smooth surface and brittleness of glass. These beds are traversed by sundry veins of trap of different aspects and compositions, undergoing at the same time great disturbance. The trap is sometimes porphyritic, at others it has the aspect of an ordinary dark-blue basalt, and in some instances the vein, dark-blue and hard in the middle, becomes of a very pale smoke-blue at the edges.

Climate and products.

The temperature is mild in proportion to the latitude, the air is moist, and the weather rainy, as the Southern and Western winds which generally prevail never fail to

VOL. XXV.

bring heavy showers. The moisture of the climate is said to be increasing, without however proving injurious to the health of the inhabitants. The heavy rains are a great impediment to the cultivation of corn, as even barley and oats, the hardiest of the *cerealia*, are often lodged and rotted, and the harvest is sometimes retarded so late as the middle of November. The prevalence of moisture acting on a soil naturally very fertile, clothes the ground with a perennial and luxuriant verdure. As there is no peat, the inhabitants suffer from want of fuel, and are obliged to bring it from the main land and from the neighbouring Island of Rum. In the Winter of 1791, their wants were so pressing in this respect, as to compel them to burn their furniture. Muck forms part of the Parish of Small Isles, the Minister of which, generally resident in Eigg, officiates in the smaller Island once a month. The M'Lean family own the greater part of the Island. The Language spoken is Gaelic, though numerous traces of Danish may be observed in the names of places. In 1821 it contained Population. 57 houses, occupied by 321 persons. Longitude 6° 12' West, latitude 56° 48' North.

Macculloch, Description of the Western Islands, 2 vols. 8vo. Lond. 1819; Sir John Sinclair, *Statistical Survey of Scotland*.

MUCKER, v. } A. S. *mucg*, *muga*, a heap. See
MUCKERER. } MUCH, and MORE. Chaucer renders the Lat. *coacervare*, to *mucker*; and the Italian has *amuchiare*, *mucchiare*, *moccheare*, to heap up, to accumulate. Scotch *mochre*, see Jamieson.

Lord, trowe ye that a coveitous wretch,
That blameth love, and halte of it dispite
That of tho pens that he can *muckre* and ketch
Ever yet yave to him soche delite,
As is in love.

Chaucer. Troylus and Creseide, book iii. p. 263.

Certes, that gold and that money shineth, and yeueth better renome to them that dispenden it, than to thilke folke that *mockeren*, for auarice maketh alwaie *muckerers* to ben hated, and largesse maketh folke dere of renome.

Id. Boecius, book ii. p. 413.

MUCOUS. See MUCILAGE, ante.

Its food being flies and such as suddenly escape, it hath in the tongue a *mucous* and slimy extremity, where by upon a sudden emission it in inviscates and tangleth those insects.

Sir Thomas Brown. Vulgar Errours, book iii. ch. xxi. p. 194.

MU'CRO, } Lat. *mucro*, a point; Gr. *μικρός*,
MU'CRONATED. } small.

True it is that the *mucro* or point thereof inclineth unto the left.

Sir Thomas Brown. Vulgar Errours, book iii. ch. ii. p. 232.

Gems are here shot into cubes consisting of six sides and *mucronated* or terminating in a point. *Woodward.*

MUCUNA, in Botany, a genus of the class *Diadelphia*, order *Decandria*, natural order *Leguminosæ*. Generic character: calyx bell-shaped, two-lipped, inferior lip three-cleft, segments acute; superior lip entire, obtuse; standard of the corolla shorter than the wings and keel, keel oblong, straight, acute; pod oblong, two-valved.

A genus allied to *Dolichos*, containing seventeen species, natives of both Indies.

MUD, v. } D. *modder*; Ger. *moder*; Sw.
MUD, n. } *modd*. The A. S. *mic-jan* is also
MU'DDLE, v. } written *mi-han*; to wet; whence *mud*
MU'DDY, v. } will be regularly formed, and (as the
MU'DDY, adj. } Lat. *lutum*) will mean, (any thing,
MU'DDILY, } soil, earth, &c.) *wetted*. To *mud*,
MU'DDINESS. } To cover with, to bedaub with *mud*;

MUD. and consequentially, to bedaub, to pollute, to defile; to
 — **MUFF.** turmoil, to disturb. And *muddy*,
 Foul, turbid; thick, dull.

Call back the bloud that made our stream in nearness,
 And turn the current to a better use;
 'Tis too much *mudded*; I do grieve to know it.
Beaumont and Fletcher. The Woman Hater, act v. sc. 3.

Partly that she may the better, by this closeness, preserve her
 own natural taste and vigour from the corruptions of the world;
 and partly, that she may not be defiled and *mudded* by the prophane
 feet of the world.

*Hall. Works, vol. iii. p. 282. Paraphrase upon the Hard Texts of
 Scripture. Song of Solomon, ch. iv. ver. 12.*

She runs her silver front into the *muddy* fen.
Drayton. Poly-olbion, song 25.

DOL. You *muddie* rascall, is that all the comfort you giue me?
Shakspeare. Henry IV. Second Part, fol. 84.

— The people *muddied*,
 Thicke and vnwholsome in their thoughts, and whispers
 For good Polonius' death; and we haue done but greenly
 In hugger mugger to interre him.

Id. Hamlet, fol. 273.

It seems a very wilde leap of nature, that the soul of man, from
 being so deeply and *muddily* immersed into matter as to keep com-
 pany with beasts, by vitall union with gross flesh and bones, should
 so on a suddain be changed.

More. The Immortality of the Soul, book iii. ch. i. fol. 147.

The country about Pheræ was thick set with trees, and otherwise
 full of gardens and *mud-walls*.

Raleigh. History of the World, book v. ch. iv. sec. 14. fol. 733.

It soon ended in a secret lamentation, that the fountains of every
 thing praise-worthy in these realms, the universities, should be so
muddied with a false sense of this virtue as to produce men capable
 of being so abused.

Spectator, No. 484. col. 4.

I say, had all this globe been mire or *mud*, then could there have
 been no possibility for any animals at all to have lived, excepting
 some few, and those very dull and inferior ones too.

Ray. Of the Creation, part ii. p. 239.

He never *muddles* in the dirt
 Nor scowrs the street without his shirt.

Swift. Dick's Variety.

If none invite you, sir, abroad to roam,
 Then—Lord, what pleasure 'tis to read at home:
 And sip your two half-pints with great delight,
 Of beer at noon, and *muddled* port at night.

Pitt. A Dialogue between a Poet and his Servant.

— Take care
 Thy *muddy* beverage to serene, and drive
 Precipitant the baser, ropy lees.

J. Philips. Cider, book ii.

The purest water issuing from the fountain, when it slides into a
 dirty and *muddy* kennel, immediately loses its clearness and virgi-
 nity, and becomes as filthy as the place in which it runs.

South. Sermons, vol. xi. p. 8.

The *mud-fed* carp refines amid the springs.

Armstrong. An Epistle to John Wilks, Esq.

MUFF, } D. *mof, moffle*; Ger. *muff, muffel*;
 — **MUFFLE, v.** } Fr. *moufle*; Low Lat. *muffula*; (ma-
 — **MUFFLER.** } *nium infula*? See Menage and Wach-
 ter.) Cotgrave interprets Fr. *mufle*, "the snout or
 muzzle," the lower part of the head of some animals.
 To *muffle* is thus applied:

To cover or envelope (e. g. the hand) so as to impede,
 embarrass, or prevent the action of the distinct parts;
 to cover, to enfold or wrap up; (so as to conceal from
 view, or protect from weather.)

As though our eyes were *muffled* with a cloude.

Gascoigne. Chorusses from Jocasta, act iii.

And y^e leper in whome the plague is shall haue his clothes ret and
 his hed and his mouth *moffeld*, and shal be called vncleane.

Bible, Anno 1551. Leuiticus, ch. xiii.

And rings and *mufflers*.

Geneva Bible, 1561. Isaiah, ch. iii. ver. 21.

The ribbon, fan, or *muff* that she
 Would should be kept by thee or me,
 Should not be giv'n before too many.

Suckling. To his Rival.

The palefac'd Night beheld thy heavy chear,
 And would not let one little star appear,
 But over all her smokey mantle hurl'd,
 And in thick vapours *muffled* up the world.

Drayton. England's Heroical Epistles. Mortimer to Queen Isabel.

Such as carrie the flowers above said, stuffe the inner parts of
 their legs behind (and those Nature for that purpose hath made
 rough) with the helpe of their fore feet, and those again are charged
 full by the meanes of their *muffle*.

Holland. Plinie, book xi. ch. x.

He brought with him diuers things, which he ment to present
 her, with his own hands, that is to say, a parlet, a *muffler*, a cup,
 and other things.

Stow. Henry VIII. Anno 1539.

A philosopher that says, That which supports accidents is some-
 thing he knows not what; and a country-man that says, The
 foundation of the great church at Harleam is supported by some-
 thing he knows not what, and a child that stands in the dark upon
 his mother's *muff*, and says he stands upon something he knows
 not what, in this respect talk all three alike.

Locke. Works, vol. i. fol. 347. Letter to the Bishop of Worcester.

Her fur is destin'd still her charms to deck,
 Made for her hands a *muff*, a tippet for her neck.

Pitt. The Fable of the Young Man and his Cat.

When the malefactour comes once to be *muffled* and the fatal
 cloth drawn over his eyes, we know that he is not far from his
 execution.

South. Sermons, vol. i. p. 530.

Balbutius *muffled* in his sable cloak,
 Like an old druid from his hollow oak,
 As ravens solemn, and as boding, cries,
 "Ten thousand worlds for the three unities!"

Young. Love of Fame. Satire 3.

MUG. Skinner suggests the Welsh *mwglio*, to
 warm, *q. d.* a vessel to warm liquor in. It means
 merely a *wet*, *sc.* a draught of liquor; afterwards ap-
 plied to,

A vessel for containing liquor. *Muggy* is
 Wet, damp, dank; (dense and damp with some de-
 gree of warmth.) See MUCK.

The clamorous crowd is hush'd with *mugs* of mum,
 Till all, tun'd equal, send a general hum.

Pope. The Dunciad, book ii.

He has the confidence to say, that there is a *mug-house* near
 Long Acre, where you may every evening hear an exact account of
 distresses of this kind.

Tatler, No. 180.

At other times the circling *mug*,
 Like Lethe's draught, or opiate drug,
 Will strike the senses on a heap,
 When folks talk wise, who talk asleep.

Lloyd. A Familiar Epistle to a Friend.

MUGGER. See HUGGER.

MUGIENT, from *mugiens*, present participle of
mugire, to low or bellow.

4. That a bittor maketh that *mugient* noyse, or as we term it
 bumping, by putting its bill into a reed as most believe, or as Bello-
 nius and Aldrovandus conceive, by putting the same in water or
 mud, and after a while retaining the ayr but suddenly excluding it
 again, is not so easily made out.

Sir Thomas Brown. Vulgar Errours, book iii. ch. xxvii.

MUGIL, Lin.; Mullet, Fleming. In Zoology, a
 genus of animals belonging to the family *Mugiloides*,
 order *Acanthopterygii*, class *Pisces*.

Generic character. Head flat, broad, and depressed,

MUGIL. completely covered with scales; lips fleshy and indented, the middle of the lower jaw forming a projecting angle, which is received into a depression within the upper; mouth toothless, except on the edges of the tongue; gill-flaps large and prominent; body nearly cylindrical; dorsal fins short, the first opposite the anal; pectorals not elongated; branchial membrane three-rayed.

M. Cephalus, Lin.; *le Mulet de Mer*; *Cephalo* of the Italians; *Common Mullet*, Flem. Sometimes acquires ten or twelve pounds in weight; the back brownish or bluish black, the belly silvery, and striped longitudinally with eight narrow dusky streaks. It is very common in the Mediterranean and on the Western coasts of the Atlantic, but rare in the British Channel. In the Spring they enter the mouths of rivers in large shoals, so numerous indeed as to give the water a blue appearance. They are taken much in the same way as Herrings, the nets being laid in circles which are gradually narrowed, and the fish in attempting to escape are entangled in the meshes.

M. Auratus, Risso; *le Muge doré*; *Golden Mullet*. The back dusky blue; belly silvery; seven deep bands on the sides; the gill-flaps marked with an oval, golden spot; abdominal fins reddish, anal white, and caudal azure. Found off the coast of Nice.

M. Saliens, Risso; *le Muge Sauteur*; *Leaping Mullet*. Not more than a pound in weight; the body elongated, head more pointed than in the preceding species; general colour silvery, with five longitudinal azure stripes; the gill-flaps marked with oblong, golden spots. It is remarkable for the great leaps it takes when enclosed in the net.

M. Provençalis, Risso; *le Muge Provençal*; *Provence Mullet*. This fish often weighs eight pounds; the back delicate blue, the belly silvery-white; the sides marked with seven little bluish and golden rays; anal fin white, pectorals yellowish, ventrals red. Very common in the Var during Spring and Summer.

M. Tang, Bloch; *Guinea Mullet*. Back brown, sides white, marked with numerous narrow, longitudinal, yellow stripes. Found in the rivers of Guinea.

M. Plumierii; *Plumierian Mullet*. General colour yellow, but unstriped. From the Antilles.

M. Albula, Linn.; *Silvery Mullet*. General colour silvery and unstriped. Common in North America, and especially on the coast of Carolina: during the Summer it ascends the rivers in such quantities as to cover the surface of the water.

See Linnæi *Systema Naturæ* a Gmelin; Risso *Ichthyologie de Nice*; Fleming, *British Zoology*.

MUHLENBURGIA, in Botany, a genus of the class *Triandria*, order *Digynia*, natural order *Gramineæ*. Generic character: calyx very minute, one or two valved; corolla two-valved, hairy at the base, exterior valve terminating in a slender bristle.

Two species, grasses, natives of North America.

MULBERRY, D. *mylbeere*; Ger. *maul-beer*; *bacca mori*, and derived from the Lat. *morus*, r into l, no unusual change. Wachter. Somner and Lye have *A. S. mur-berian*.

The trivial name of the *Morus* of Linnæus.

And ouer the olyue trees and mulbery trees that were in the valeyes was Baal Hanan the Gadarit.

Bible, Anno 1551. 1 Chronicles, ch. xxvii.

In the 5th year, he gave order for planting of mulberry-trees, and breeding of silk worms, that England might be a country, as well of silk as cloth.

Baker. King James, 1st.

MULCT, v. } Fr. *multier*; It. *multare*; Sp. *mul-*
MULCT, n. } *tar*; Lat. *multare*, to amerce. Vos-
MULCTUARY. } sius quarrels with the Etymology of
 Varro, and with good reason, but has no better to pro-
 pose.

To amerce, to impose, to exact an amercement, fine, or penalty.

How many poore creatures hast thou mulcted with death for thine own pleasure.

Hall. Works, vol. i. fol. 116. *A Meditation on Death*.

For the offence, a mulct imposed on the possessors of Blackmore (called white-hart silver) is to this day paid into the exchequer.

Selden. Illustrations of Drayton's *Poly-olbion*, song 2.

A mulct thy poverty could never pay,

Had not Eternal Wisdom found the way.

Dryden. *Religio Laici*.

The last common branch of the king's revenue, consisted of forfeitures, both of lands and goods, in cases of treason; and fines, or some known mulctuary punishments upon other crimes which were distinctly prescribed in the Saxon laws even for manslaughter and murder itself.

Sir William Temple. Works, vol. iii. p. 142. *Introduction to the History of England*.

MULE, } Formerly also written *moyl*. Fr.
MULETEER, } *mule*, *mulet*; It. *mulo*; Sp. *mulo*; Lat.
MULISH. } *mulus*. Vossius suggests four several
 Etymologies. One, the Gr. *μῶλος*, labour, he supports
 by a reference to Pliny. See the Quotation from Hol-
 land.

The mule is a cross breed from the horse and ass; and the word is applied to other productions out of their specific course.

Mulish, met. stubborn, obstinate.

_____ & myd so gret charge perto
 Of mules, of cartis and of horse.

R. Gloucester, p. 189.

And thus after hir lordes graunt,
 Upon a mule white amblant
 Foorth with a fewe rode this queene.

Gower. Conf. Am. book ii. p. 56.

This is right the old embleme of the moyle cropping of thistles.
 Beaumont and Fletcher. *The Scornful Lady*, act ii. sc. 1.

Ever after they made a proverb of it and called such as were painfull and willing to do that which they were commanded without grudging *Marius moils*.

Sir Thomas North. *Plutarch*, fol. 354. *Caius Marius*.

Friday the third day of May, his lordship being amply furnished all at the king's cost with coaches, litters, mules, mulets and all other necessaries.

Stow. James, Anno 1604.

Between the hee asse and a mare is a mule engendred, and foled in the twelfth moneth: a beast of exceeding strength to beare out all labour and travell.

Holland. *Plinie*, book viii. ch. xlv.

TALB. _____ Base muleteers of France,

Like pesant foot-boys doe they keep the walls
 And dare not take up armes, like gentlemen.

Shakspeare. *Henry VI. First Part*, fol. 108.

Then from the ships proceeds

A train of oxen, mules, and stately steeds,
 Vases and tripods (for the funeral games.)

Pope. *Homer. Iliad*, book xxiii.

For Idæus directed the mulish machine

While horses drew that in which Priam was seen.

Byrom. *Epistles to George Lloyd, Esq.* epis. 3.

The creature is so sure to kick and bite,

A muleteer's the man to set him right.

Cowper. *Progress of Error*.

MULIO, in Zoology, a genus of *Dipterous* insects.

Generic character. Antennæ porrected, distant, triarticulate, with the basal joint short, cylindric, the second cup-shaped, the third conic, acute; head trans-

MULIO. verse; eyes elliptic; *proboscis* horizontally exerted, very long; wings expanded during repose.

MULL.

Type of the genus, *Cytherea obscura*, Fabricius. *M. obscurus*, Meigen, *Zweif. Eur.* vol. ii. pl. xvii. fig. 27, 28. About five species, all natives of Europe.

MULL, v. } *Vinum molitum*; i. e. rendered

MULSH. } milder by admixture of sugar, and having its spirit subdued by warmth. It is probably from the A. S. *mil-escian*, *mitescere*. Hanmer (on Shakespeare) says, softened, and dispirited as wine is when burnt and sweetened. Lat. *molitus*.

Mulsh, which Ray calls straw half rotten, is from the same source; to *mulsh* the roots of trees, is to lay about them straw or other litter, softened or saturated with water; also to soften or saturate the earth itself.

Peace is a very apoplexy, lethargie, *mull'd*, deafe, sleepe, insensible, a getter of more bastard children then warres a destroyer of men. *Shakspeare. Coriolanus*, fol. 23.

Now we trudg'd homeward to her mother's farm

To drink new cyder *mull'd* with ginger warm.

Gay. *The Shepherd's Week. Pastoral* 5. l. 105.

While gen'rous white-wine, *mull'd* with ginger warm,

Safely protects her inward frame from harm.

Jenyns. *The Art of Dancing*, can. 2.

MULL, n. } Ray, North Country words:—*Mul-*

MU'LLOCK } *lock*, dirt, rubbish. Tyrrwhitt:—dung, rubbish.

The *mullok* on an hepe ysweped was
And on the flore ycast a canevas,
And all this *mullok* in a sive ythrowe,
And sifted, and ypicked many a throwe.

Chaucer. *The Chanones Yemannes Tale*, v. 16408.

That other coffre of strawe and *mull*,
With stones mened (mixed) he filde also.

Gower. *Conf. Am.* book v. p. 141.

Extent.

MULL, anciently called Dreolin, the third in magnitude of the Western Islands of Scotland, is of a very irregular form, being deeply indented by Loch na Keal and Loch Scriden, and projecting towards the South-West into a long promontory called the Ross. Its extreme length, which is at the Southern side, is 30 miles, its breadth 25, its superficial extent about 420 square miles.

Aspect of the country.

In that part of the Island to the North of Loch na Keal the basis of the soil is trap, and the whole surface is hilly and irregular, presenting every where that aspect so characteristic of trap Countries in the terraced arrangement of the land, rising by numerous stages from the shores to the highest elevation, which no where exceeds 1500 feet. The shores are various in appearance, sometimes they present cliffs, at others the rocky terraces on the grassy slopes descend to the water's edge. In the bays sandy beaches occur consisting of minute fragments of shells. Picturesque scenery is seldom to be met with: but a few of the promontories on the Western side present interesting views, as they are clothed in ivy, or decorated by the scattered remains of ash and oak copses. The basaltic veins occurring in that vicinity often have singular appearances, bearing a striking resemblance to the ruins of castles, as they project in pointed fragments high above the surrounding surface, which has sunk, in consequence of the decomposition of the materials composing it. Southward of Loch na Keal the land rises on an average to the height of 2000 feet, and is bounded on its Western side by cliffs attaining generally an elevation of 1000 feet. These cliffs contain several caves, of which the largest is called Mackinnon's, from an individual of that name, who, according to the tradition of

Mackinnon's Cave.

the country people, having rashly attempted to explore its inmost depths, was never heard of more. It appears to be one of the discontinuities formed by a vein of trap which has been afterwards washed out. On the Eastern side of this part of the Island rises a group of high hills forming the mountainous tract of Torosay, visible from its elevation afar throughout the Western shores of Scotland, and almost incessantly beaten by storms and rain. Ben More, the highest mountain of Torosay, has an elevation of 3097 feet; the summit of Ben y Chat, which is next in height, is 2294 feet above the level of the sea. The Southern part of the Island is the least elevated, and in its Western extremity consists of quartz and granite, instead of trap, which predominates elsewhere. There are many small lakes dispersed over the Island, and the surface is traversed by numerous brooks, which, however, no where unite into a stream of any magnitude. Coal has been discovered in several places, but the strata are so scanty and broken as to render ineffectual many attempts made to work them for fuel. The shore affords some good refuge for shipping. At Tobermory is a creek capable of admitting vessels of considerable burden, and Loch Scriden is a road sheltered from most winds and having safe anchorage.

The thermometer, in general, ranges high in proportion to the latitude, but the climate is moister and more rainy than in any other of the Western Islands. This probably results not only from the altitude of its own hills but also from the elevation and length of the range which, on the main land, extends from Cruachan to Ben Nevis, and assists in precipitating the clouds driven from the Atlantic by the Westerly gales. The violence of these gales and the heaviness of the showers are inconceivable by those who have never witnessed their effects. This severity of the climate has frustrated attempts made to plant larch and fir in various parts of the Island, as all those trees have in a few years had their growth checked, and ultimately have been destroyed. Some centuries ago, Mull was famous for its woods; and copses of oak, intermixed with birch and hazel, still occur in many places; but the soil is at present found too shallow, and the air too stormy and inclement, to allow oak to reach the size of a timber tree. Birch, alder, and ash thrive well, but the inhabitants do not make their growth an object of attention corresponding to its importance.

In Ross the soil is rocky yet better suited for the growth of corn than other parts of the Island, where the ground, though fertile, is found to be most suitable for grazing, as even oats, the hardiest of all grain, are with difficulty brought to ripen. The mountains afford productive pasture, and even Ben More is clothed nearly to its summit with luxuriant grass. This fertility results from the prevalence of trap rocks, all of which seem to be of such a conformation as on mouldering to be converted readily into good soil. The inclination of the surface causes the abundant rains to flow quickly away, and leave a verdure instead of the heaths and coarse herbage which are produced where moisture stagnates on the ground. The farming stock of the Island is estimated at 8000 black cattle, and 15,000 sheep, besides a considerable number of horses, the breed of which is said to have been originally derived from some of those animals saved out of the wreck of a vessel belonging to the Spanish Armada. Kelp is the only material object of manufacture: the average produce is 600 tons yearly.

Agriculture.

MULL.

MULLUS.

The principal relic of antiquity is Castle Duart, once the strong hold of the M'Leans, and until lately garrisoned by a detachment from Fort William. The Castle of Aros, also built by Macdonald, Lord of the Isles, and that of Moy are striking ruins. A few cairns and rude structures in stone are memorials of the occupation of the Danes.

There is not in the Island any collection of residences to which the name of town is applicable except that at Tobermory. *Tobermory*, built in 1789 by the Society for the encouragement of Fisheries. It is disadvantageously situated as a fishing station, and as the population of the Island is not sufficiently numerous or refined to afford a market for manufactures, the buildings are for the most part unoccupied and falling to decay. Mull is divided into three Parishes, Kilfinichen, Kilninian, and Torosay, containing, in 1821, 10,522 persons remarkable for a mild and humane disposition, and such a regard for morals and obedience to the laws that a capital punishment has not taken place in the memory of the oldest inhabitant. Latitude $56^{\circ} 30'$ North, longitude 6° West.

M'Culloch, *Description of the Western Islands*, 2 vols. 8vo., London, 1819; Sir John Sinclair, *Statistical Account of Scotland*.

MULLERA, in *Botany*, a genus of the class *Dia- delphia*, order *Decandria*, natural order *Leguminosæ*. Generic character: calyx four-toothed; seed-vessel necklace-formed, globules fleshy; one-seeded.

Two species, natives of Africa and South America.

MULLERIA, in *Zoology*, a genus of *Echinodermatous Radiata*.

Generic character. Body lengthened, covered throughout with suckers; mouth terminal, furnished with a circle of osseous pieces instead of teeth, and surrounded by retractile tentacula; oviduct opening near the mouth; anus terminal.

Type of the genus *Holothuria digitata*, Montagu, *Linn. Trans.* vol. xi. pl. iv. fig. 6.

About three species; one of which frequents the South-Western coasts of Britain.

MULLIGRUBS seems to have an application somewhat similar to that of *Maw-worm*, viz. to some unknown disease in the bowels; for which fanciful causes are assigned: the latter part of the word will then be easily accounted for; and as to the first, Dr. Jamieson is too learned.

THOM. What's the matter?

Whether go all these men-menders? these physicians?

Whose dog lies sick o' th' mulligrubs?

Beaumont and Fletcher. Monsieur Thomas, act ii. sc. 2.

MULLUS, Lin. Cuv.; *Surmullet*, Fleming. In *Zoology*, a genus of animals belonging to the family *Percoides*, order *Acanthopterygii*, class *Pisces*.

Generic character. Body oblong, slightly compressed; head of moderate size and sloping gills; no teeth in the upper jaw, but large flat teeth in the palate; the eyes large and near each other; beneath the middle of the lower jaw, a pair of long barbs, which when at rest sink between the sides of the jaw; no spine on the opercule; three rays in the branchial membrane; the head and body covered with large and loosely attached scales; dorsal fins two, distinct from each other; ventral beneath the pectoral fins.

The fishes belonging to this and the neighbouring genus *Upeneus*, are considered by Cuvier as almost forming a distinct family from the perch-like fish among

which he first placed them. They are remarkable for the beauty of their colour, and for the delicacy of their flavour, and were held in high estimation by the Ancients. They were known to the Greeks by the name *τρίγλα*, which seems to have arisen from their dedication to the Triple Hecate, or Diana, who was sometimes called *τρίγληνη*, and to this time in many parts of Italy they are called *Triglia*. Aristotle derives this name from his assertion that they spawn thrice a year. Pliny derives their Latin name *Mullus*, from their colour resembling that of the shoes called *Mullei* worn first by the Alban Kings, next by the Republican Consuls, Pretors, Curule Ædiles, and subsequently by the Emperors of Rome, but it is more probable that the name of the shoes was borrowed from the fish. The avidity with which they were sought, and their extravagant price, are well described by the Roman Satirists. Juvenal speaks of the former in his Vth *Satire*:

*Mullus erit domino quem misit Corsica, vel quem
Tauromenitanæ rupes, quando omne peractum est
Et jam defecit nostrum mare.*

and Martial (x. 31.) of the latter:

*Addixi servum nummis herè mille trecentis
Ut bene cœnares, Calliodore, semel;
Nec bene cœnasti. Mullus tibi quatuor emptus
Librarum, cœnæ pompa caputque fuit.
Exclamare libet, non est hic improbe non est
Piscis: homo est; hominem Calliodore voras.*

Juvenal also in his Xth *Satire* mentions one as having been sold for 6000 sesterces, a sum nearly equal to £47 sterling. Seneca in his XCVth *Epistle* mentions another presented to Tiberius, who thought it better worth sending to market than eating, and which being bid for by Apicius and Octavius was carried off by the latter at the trifling cost of 5000 sesterces, or nearly £39. And Suetonius, in his *Life of Tiberius*, mentions three which together produced 30,000 sesterces, or about £234 of our money; an extravagance which induced that Emperor to establish sumptuary laws, and to tax the provisions brought into the market. Nor do these epicures seem to have been satisfied with the enormous price of their favourite fish; they delighted in having them brought alive to table in large crystal vases that they might enjoy the pleasure of seeing the varying colours of the dying fish. Seneca gives an entertaining account of such trifling, and states, that the Surmullet was thus served up, in order that it might be eaten as fresh as possible; and Galen mentions that the liver was considered the most delicious part, and was mashed up in wine as a sauce for the whole fish.

Surmullets prefer the neighbourhood of the shore to the deep sea, and are found rooting about like hogs in the sand, or mud, leaving their marks in shape of round holes. They are very cunning, and in the attempts to take them, the whole shoal often escapes by leaping over the nets. In the South of France they are often taken in weirs made of reeds and placed in the shallows. The roes are taken out, covered with salt for four or five hours, pressed between two boards or stones, and having been dried in the sun for thirteen or fourteen days, are then called Botargo.

M. Surmuletus, Lin.; *le Surmulet ou grand Mullet rayé de jaune*, Cuv.; *Striped Surmullet*, Flem. About twelve inches in length; the general colour of the back and sides bright vermilion-red, marked with three lon-

MULLUS. longitudinal golden-yellow lines which are more distinct about May; belly white, tinged with rose colour; rays of the fins more or less red, except the inner of those of the ventral, and the hinder of those of the anal fins, which are jonquil; the membrane of the first dorsal yellow; in some, both dorsal fins are marked with two deeper yellow oblique bands, in others with two brown bands; irides pale yellow tinged in some parts with red, the pupils large and black; the barbs or cirrhi are long, and when viewed through a lens appear covered with little, projecting, delicate, serrated points. This fish is found not only in the Mediterranean, but also in the British Channel, the Baltic, and the Atlantic: Commodore Byron found them in great numbers on the coast of Patagonia. It is predaceous, feeding on small fish, on crustaceous and testaceous animals, and the remains of animal substances. In some places, whence they have to be sent to a distance, they are boiled and enclosed in a paste to preserve them from the air.

M. Barbatus, Lin.; *le vrai Rouget ou Rouget barbet*, Cuv.; *Bearded or Red Surmullet*. Rather less than the preceding from which it is especially distinguished by the head being more vertical; it is of a deeper and more uniform red or carmine colour, with iridescent glossings, but unmarked with yellow stripes; the under parts are silvery; fins yellow. It is principally found in the Mediterranean, and very rarely in the British Channel. This Cuvier considers to be the fish which was brought to table by the Romans in glass vases.

M. Hascatus, Rafinesque; *Triglia di fango* of the Sicilians; *Dusky Surmullet*. The head more obtuse than in the yellow-streaked species, it is rather brown than red, the sides striped with yellow; the tail brown at its base and reddish at the tip, the other fins orange.

Schneider mentions another, the *M. Hispanicus*, of large size, with spotted dorsal fins, but places it among the not well-described species.

See Cuvier and Valenciennes, *Histoire Naturelle des Poissons*.

MULTIFA'RIOUS, } Lat. *multifarius*, from
MULTIFA'RIOUSLY. } *multum*, and *fari*, *quod*
multis modis est fari; sic Græcis πολύφατος, α φάται,
fari; *deinde non sermonis tantum, sed et aliis varieta-*
tibus dicitur. Martinius. Generally,

Various, or having many variations; diversified.

When a man acts with a *multifarious* intention he must needs be distracted in his operations, and the force of his faculties being divided by the *multiplicity* of his aims, must needs be so weakened, that 'twill be impossible for him to pursue any one of them with vigour and activity.

Scott. *Christian Life*, part i. ch. iv. fol. 98.

The beauteous lake,
The pines wide-branching, falls of water clear,
The *multifarious* glow on Flora's lap
Lose all attraction.

Glover. *Leonidas*, book iv.

The generic words which abound in language assort, and (if I may use the expression) pack up under a comparatively small number of comprehensive terms, the *multifarious* objects of human knowledge.

Stewart. *Philosophy of the Human Mind*, vol. ii. ch. ii. sec. 2. p. 125.

MULTIFIDOUS, Lat. *multifidus*, in multis *partibus* fissus, from *findere*, to cleave.

Cleft, or divided into many parts.

Thus much we may observe, those animals are only excluded without sight, which are *multiparous* and *multifidous*, that is, which have many at a litter, and have also their feet divided into many portions.

Sir Thomas Brown. *Vulgar Errors*, book iii. ch. xxvii. p. 220.

MULTIFORM, } Lat. *multiformis* (*multus*, and
MULTIFORMITY. } *forma*, a frame, or shape.)
Having many *forms* or shapes, many appearances;
various, or divers, in *form*, shape, or appearance.

Air, and ye Elements the eldest birth
Of Nature's womb, that in quaternion run
Perpetual circle, *multiform*; and mix
And nourish all things.

Milton. *Paradise Lost*, book v. l. 182.

How prophane are others? barking out a *multiformity* of oaths like hellish Cerberi, as if men could not be gallants, unless they turned devils.

Purchas. *His Pilgrimage*. To the Reader.

From that most one God flows *multiformity* of effects, and from that eternall God temporall effects.

Hall. *Works*, vol. i. fol. 511. *Noah's Dove*.

That the *πολυποίκιλος σοφία*, the manifold or *multiform* wisdom of the Creatour might be displayed, acknowledged, and celebrated.

Barrow. *Works*, vol. ii. fol. 180. *Sermon* 11.

You have seen, that, by virtue of that peculiar structure which brings them under these rules of interpretation, the most *multiform* of the scripture prophecies do equally with the most simple afford a positive evidence of God's providential government of the world.

Horsley. *Sermon* 18. vol. ii. p. 109.

MULTIPAROUS, bearing, or bringing forth, (Lat. *parere*,) many—at a litter. See **MULTIFIDOUS**, *supra*.

Which double formations do often happen unto *multiparous* generations.

Sir Thomas Brown. *Vulgar Errors*, book iii. ch. xv. p. 177.

Multiparous quadrupeds, as dogs, as swine, are furnished with a multitude of paps: whereas those beasts which bring forth few, have but a few.

Ray. *Of the Creation*.

MULTIPLY,
MULTIPLICATE,
MULTIPLICATION,
MULTIPLICITY,
MULTIPLICIOUS,
MULTIPLICIOUSLY,
MULTIPLIER,
MULTIPLYING, *n*.
MULTIPLIABLE.

Fr. *multiplier*; It. *moltiplicare*; Sp. *multiplicar*; Lat. *multiplicare*, *multiplicem facere*; to render manifold, *multiplax*, *multis plicis constans*, consisting of many folds.

To increase by many involutions, generally, to increase the number.

For *Multiplication* in ARITHMETIC, see vol. i. p. 488.

Multiplication (as in Chaucer, Gower, and Stowe) is applied, to the making of gold and silver.

pat God for hus grace. zoure grayn muelleplie.

Piers Ploukman. *Vision*, p. 135.

Here is a mitaine eke, that we may see:

He that his hand wol put in this mitaine

He shal have *multiplying* of his graine.

Chaucer. *The Pardoner's Tale*, v. 12308.

Who so that listeth uttren his folie,

Let him come forth and larnen *multiplie*.

Id. *The Chanones Yemannes Tale*, v. 16303.

For bothe troo by my salvation

Concluden in *multiplication*. Id. *Ib.* v. 16317.

And thus though that he *multiplie*

His golde, without tresorie

He is. Gower. *Conf. Am.* book v. p. 124.

It maketh *multiplication*

Of golde. Id. *Ib.* book iv. p. 114.

Some things do through our judgment pass

As through a *multiplying-glass*.

Cowley. *Ode. Of Wit*.

They [the purveyors] are the only *multipliers* in the world; they have the art of *multiplication*.

Bacon. *A Speech touching Purveyors*.

Therefore the *multiplying* of nobilitie, and other degrees of qualitie, in an over proportion, to the common people, doth speedily bring a state to necessity.

Id. *Essay* 15. p. 84.

Good deeds are very fruitfull; and not so much of their nature, as of God's blessing *multipliable*

Hall. *Works*, vol. i. fol. 55. *Meditations and Vows*. Cent. 3. p. 78.

MULTI-
FORM.
—
MUL-
TIPLY.

**MUL-
TIPLY.** Item, you commaunded *multiplication* and alchimistrie to bee practised, thereby to abait the king's coine.

Stow. *Edward VI. Anno 1549.*

**MULTI-
TUDE.**

For properly the animal [Amphisbæna] is not one, but *multiplious* or many, which hath a duplicity or gemination of principal parts.

Sir Thomas Brown. *Vulgar Errours*, book iii. ch. xv. p. 177.

For the seed conveyeth with it not only the extract and single idea of every part, whereby it transmits their perfections and infirmities; but double and over again; whereby sometimes it *multipliously* delineates the same as in twins, in mixed and numerous generations.

Id. *Ib.* book vii. ch. ii. p. 423.

To see the *multiplicity* of books
That pester it, may well believe the press,
Sick of a surfeit.

Drayton. *The Moon-Calf.*

———— Echo with their sorrow sports;
From hill to hill from grove to grove she bounds,
And catches, breaks, and *multiplies* the sounds.

Lewis. *Statius*, book vi.

There is another thing considerable in this *multiply* number of the eye; and that is, that the object seen is not *multiplied* as well as the organ, but appears but one, though seen with two or more eyes.

Derham. *Physico-Theology*, book iv. ch. ii.

This sense [smelling] I shall dispatch in less compass than the two last, because its apparatus, although sufficiently grand and admirable, (yet) is not so *multiplious* as of the eye or ear.

Id. *Ib.* book iv. ch. iv. p. 138.

Moreover, as the manifold variation of the parts, so the *multiplicity* of the use of each part, is very wonderful.

Grew. *Cosmo Sacra*, book i. ch. v. fol. 25.

In the fecundity of the human, as of every other species of animals, nature has provided for an indefinite *multiplication*.

Paley. *Moral Philosophy*, vol. ii. ch. xi. p. 355.

MULTIPOTENT, Lat. *multipotens*, *multum*, much, and *potens*, powerful.

Having much power.

———— By Joue *multipotent*,
Thou shouldst not beare from me a Greekish member
Wherein my sword had not impresse made
Of our ranke feud.

Shakspeare. *Troilus and Cressida*, fol. 98.

MULTIPRESENCE, *multum*, much, and *præsens*, present, or being before.

A being before (sc. sensible) in many places at once.

I would that exploded opinion of Transsubstantiation, and (which is the root of it) the *multi-presence* of Christ's body, did not utterly overthrow the truth of his humanity.

Hall. *Works*, vol. i. fol. 625. *No Peace with Rome*, sec. 25.

MULTITUDE, } Fr. *multitude*; It. *multitudine*;
MULTITUDINOUS. } Sp. *multitud*; Lat. *multitudo*.

A great number, a large collection or assembly of individuals; a great many.

They that weren aboute Tyre and Sydon, a greet *multitude* heryng the thingis that he dide, and camen to him.

Wiclif. *Mark*, ch. iii.

And they that dwelled about Tire and Sidon, a great *multitude*; whiche when they had hearde what thingis he did, came vnto him.

Bible, Anno 1551.

So, with this bold opposer rushes on
This many-headed monster, *multitude*.

Daniel. *History of Civil Wars*, book ii.

Will all great Neptune's ocean wash this blood
Cleane from my hand? no: this my hand will rather
The *multitudinous* seas incarnardine.

Shakspeare. *Macbeth*, fol. 137.

———— Plucke out
The *multitudinous* tongue, let them not licke
The sweet which is their poison.

Shakspeare. *Coriolanus*, fol. 15.

The guilt of the crime lights upon one, but the example of it sways a *multitude*; especially if the criminal be of any note or eminence in the world.

South. *Sermons*, vol. vi. p. 215.

First an all-potent all-pervading sound
Bade flow the waters—and the waters flow'd,
Exulting in their measureless abode,
Diffusive, *multitudinous*, profound,
Above, beneath, around.

Jones. *Hymn to Narayena*.

MUM,

MU'MMER,

MU'MMERY.

D. *momme*; Ger. *mumme*, *larva*;
D. *mommer*; Ger. *mummer*; Fr. *mom-
meur*. *Larvatus*, one who wears a mask. Some derive from Gr. *μορμω*, *terriculum*, (what we call a bugbear;) others from *momus*, or *mimus*, the French applying their word *mommerie*, to the sport of *momes*, or *mimes*, who deride others; and this latter Etymology seems the more probable. The Greek *Μῦμος*, the *make-game* even of his brother Gods, transmitting his name and characteristics to all the modern European Languages.

Mum, Skinner calls, an interjection indicating silence, because while we pronounce this word we draw the upper to the lower lip, and shut the mouth: it may be so applied from the silence observed by *mummers* when playing their tricks, and especially when making them a cloak for thievery.

Mome; one who cannot or will not speak; a speechless, senseless, stupid fellow.

þow mygt bet mete ye mýst. On Malverne hilles
þan gete a mom of hure mouth. til moneye be hem shewid.
Piers Plouhman. *Vision*, p. 8.

But I must tell this tale thus for the nones long
When men crye *mumme* and keep such silence.
Gascoigne. *Flowers*. *Epitaph upon Captain Bouchier*.

And miser (he the *mome*) comes last of all.
Id. *The Fruites of Warre*.

———— And gaue on me a glum
There was amonge them no word than but *mum*.
Skelton. *The Crowne of Laurell*.

[He would] make him [the reader] wene he were walking downe to hell quicke, yf he made so much as a *mumme* against Luther's lecherye.

Sir Thomas More. *Workes*, fol. 424. *The First Part of the Con-
futation of Tyndall*.

To all thys geare you see good readers that this good man playeth as though he came in in a *mummary*.

Id. *Ib.* fol. 975. *The Debellation of Salem and Byzance*.

Men of suche matters make but *mummynge*.
Skelton. *The Crowne of Laurell*.

In whiche passe tyme the dukys of Amnarle, of Surrey, and of Excetyr, with the erlys of Salesbury and of Gloucetyr, with other of theyr affynyte, made provysyon for a dysguysynge or a *mammynge*, to be shewyd to the kyng (H. 4.) vpon twelfethe nyght.
Fabyan. *Chronycle*, Anno 1400, vol. ii.

For the Holy Ghost is no dome God, nor no God that goeth a *mummynge*.

Tyndall. *Workes*, fol. 13. *Prologue vpon the Fyue Bookes of
Moses*. *Leuiticus*, book iii.

Declaryng her [his natural mother] openly to be a woman geuen to carnall affection, and dissolute liuyng, which thing if it had beene true (as it was not in deede) euery good and naturall childe would haue rather *mummed* at, than to haue blasted abroad, and especially she beyng aliue.

Grafton. *Richard III. The second Yere*.

**MULTI-
TUDE.**
—
MUM.

MUM.
—
MUMMY.

As one with grieve and anguise over-cum;
And unto every thing did answer *mum*.
Spenser. Faerie Queene, book iv. can. 7.

Yet he (poore soule!) with patience all did beare;
For naught against their wills might countervail:
Ne ought he said, whatever he did heare;
But hanging downe his head did like a *mome* appeare.
Id. Ib. book vii. can. 6.

When you are hearing a matter betweene party and party, if you
chaunce to bee pinch'd with the collicke, you make faces like *mum-*
mers.
Shakspeare. Coriolanus, p. 8.

Curse not (this mad-man sayd) but sweare
That women be vntrew,
Their loue is but a *mummerie*,
Or as an April's dew,
Warner. Albion's England, book vii. ch. xxxvi.

This same truth is a naked and open day-light, that doth not
shew the masques, and *mummeries*, and triumphs of the world,
half so stately, and daintily, as candle-lights.
Bacon. Essay 1. p. 2.

"Nor did I ever winch or grudge it
For thy dear sake." Quoth she, "*Mum* budget."
Butler. Hudibras, part i. can. 3.

The *mum* club (as I am informed) is an institution of the same
nature, and is a great enemy to noise.
Spectator, No. 9. col. 2.

The temple and its holy rites profan'd
By *mum'ries*, he that dwelt in it disdain'd.
Cowper. Expostulation.

MUM, D. *momme*; Ger. *mumme*; which Skinner
calls a strong kind of beer, introduced by us from
Brunswick, and derived either from Ger. *mummeln*, to
mumble, or from *mum*, (*silentii indice*), i. e. either
drink that will make a cat speak, or drink that will take
away the power of speech.

See how the Belgæ, sedulous and stout,
With bowls of fattening *mum* or blissful cups
Of kernel-relish'd fluids, the fair star
Of early phosphorus salute.
J. Philips. Cider, book ii.

The clamorous crowd is hush'd with mugs of *mum*,
Till all, tun'd equal, send a general hum.
Pope. The Dunciad, book ii. l. 385.

The following receipt for MUM is said to be preserved
in the Town House at Brunswick, the City which, if it
did not give birth to the liquor, claims preeminence in
its concoction.

"Take sixty-three gallons of water that has been
boiled to the consumption of a third part: brew it with
seven bushels of wheaten malt, one bushel of oat malt,
and one bushel of ground beans: when it is tunned, let
not the hogshead be too full at first; and as soon as it
begins to work, put into of the inner rind of fir three
pounds, tops of fir and birch each one pound, Carduus
benedictus three handfals, flowers of Rosa solis one
handful or two; burnet, betovy, marjoram, avens, penny-
royal, wild thyme, of each a handful and a half; of
elder flowers two handfals or more; seeds of cardamom
bruised thirty ounces; barberries bruised one ounce.
Put the herbs and seeds into the vessel when the liquor

has worked a while, and after they are added, let the
liquor work over the vessel as little as may be; then fill
it up. Lastly, when it is stopped, put into the hogshead
ten new-laid eggs unbroken or cracked, stop it up close,
and drink it at two years end."

Our English brewers use cardamom, ginger, and
sassafras, instead of the inner rind of fir; and add also
walnut-rinds, madder, red sanders, and elecampane.

MU'MBLE, v. } D. *mommelen*, *mompelen*; Sw.
MU'MBLER, } *mumla*; which Ihre considers to
MU'MBLING. } be the Ger. *murmeln*, and Lat.
murmurare, to murmur, q. v. The D. *mommelen* seems
to be the diminutive of *mommen*, (see MUM,) and thus
to mean—to speak like one wearing a mask, with his
face, his mouth confined in a mask, and hence,

To utter an indistinct, an inarticulate sound or voice;
with the mouth closed, or but little open: to eat with
the mouth so closed.

Ne momblisnesse ne sonenesse—No *mumbling* talk
nor noisy sound. Chaucer, *infra*.

Of this mat [matter] ich myghte *momely* wel longe.
Piers Plouhman. Vision, p. 81.

And how they were accompanied with mo
Ne momblisnesse ne sonenesse also.
The poure penses were not disloged there,
Ne God wote hir place was euery where.
Chaucer. The Assembly of Ladies, p. 526.

He singes the treble part
The meane hee *mumbles* out of tune, for lack of life and hart.
Gascoigne. Flowers. Memories.

Which Barnes calleth patering, & *mumbling* of these psalmes & those
salmes without deuotion, as though he hymselfe had an yie and an
eare in euery mannes hart.

M U M M Y.

MUMMY, Fr. *mumie*; It. *mumia*; Sp. *momia*;
Low Lat. *mumia*, or properly *amumia*, from *amomum*,
of Eastern origin, Vossius. *Et. L. L.* In the II^d Book

De Vitiis, he derives *mumia* from the Arabic *mum*,
which signifies wax. He explains it to be
The flesh of man preserved against corruption in

MUMMY. balsam or myrrh, and aloes and asphalt. It is also applied to

That which distils from *mummies*; the stuff where-with they have been long imbalmed; any gummous substance; a soft, coagulated mass.

THU. You shall grow *mummy* rascals.

Beaumont and Fletcher. *The Sea Voyage*, act iii. sc. 1.

Mummy hath great force in stanching blood; which may be ascribed to the mixture of balms that are glutinous.

Bacon. *Natural History*, Cent. x. sec. 980.

Thy virtues are
The spices that embalm thee; thou art far
More richly laid, and shalt more long remain
Still *mummified* within the hearts of men,
Than if to lift thee in the rolls of fame
Each marble spoke thy shape, all brass thy name.

J. Hale. *Poems*, (1646,) p. 50.

Mummy is one of the useful medicines commended and given by our physicians, for falls and bruises, and in other cases too.

Boyle. *Works*, vol. ii. p. 451. *Occasional Reflections*, refl. 3. sec. 6.

Yet it were modest, could it but be said,
They strip the living, but these rob the dead;
Dare with the *mummies* of the Muses play,
And make love to them the Egyptian way.

Dryden. *Prologue* 39.

Let some soft *mummy* of a peer, who stains
His rank, some sodden lump of ass's brains,
To that abandon'd wretch his sanction give;
Support his slander, and his wants relieve!

Falconer. *The Demagogue*.

Derivation
and mean-
ing.

Moomea.
Natural
Mumia pis-
sasphaltus.

Artificial
Mummy.

MUMMY, to speak more precisely than Vossius has done above, is derived from the Persian word *Múmiyá*, which signifies bitumen or mineral pitch, the *pis-sasphaltos* (Plin. *Nat. Hist.* xxiv. 25. xxxv. 51. Dioscorid. i. 100.) of the Ancients; and, as it is always found in the bodies embalmed by the Egyptians, whence it is extracted by the Arabs, the name of the embalming substance was by an easy figure of speech transferred to the object embalmed; but as the drug has ceased to form a part of our *Materia Medica*, the word in its primary sense has now become almost obsolete. "The substance called *Múmiá*," says Abdu-l latíf, (p. 200.) "is found in very great abundance in the inside of the trunk and head of these bodies." "*Múmiá* properly so called," he adds, (p. 201.) "is a substance which flows down from the summit of mountains, mingled with the torrents which bring it down; it afterwards coagulates like mineral pitch, (*kár*.) and emits an odour like that of Burgundy pitch, (*zift*.) mixed with bitumen, (*káfr*.)" "It issues from springs," says Jálínús, (Galen,) "like mineral pitch (*kár*) and naphtha (*naft*.)" "Others say it is a kind of mineral pitch, and is called *hhidu-l jibál*, (i. e. Mountain Menstruum.) The *Múmiá* found within the cavities of dead bodies in Egypt, does not differ much in its nature from this, which may be substituted for it when difficult to be procured. The most common opinion is that the former is a mixture of Burgundy pitch (*zift*) and myrrh (*mur*.)" Abdu-l latíf's description is copied from Dioscorides, not Galen, as he, probably from an error of memory, affirms; and he seems to intimate that he did not value the Mummy, so much esteemed by many of his Countrymen, more highly than it deserves. The evidence of its extraordinary efficacy in preserving human bodies from dissolution for many Ages, was no doubt the chief cause of the high value set upon it; and, as is often the case, one strong prejudice expelled another, and zealous Musulmans, who would have shrunk from the touch of an idolater while living, eagerly swallowed fragments of his carcass when dead. Nor were the Christians, till

VOL. XXV.

a very late period, much more scrupulous or enlightened. **MUMMY** Dr. Lemery, a distinguished Member of the French Academy of Sciences, about a century ago, says very gravely: (p. 363.) *Les Mumies blanches, ou les corps dessechés sans embaumement, ne possèdent pas beaucoup de vertu*: and justly adds: *Il ne faut pas croire que la Mumie,* commune qu'on nous apporte, soit de la véritable Mumie d'Egypte, qui ait été tirée des sépulcres des anciens Egyptiens; celle-là est trop rare, et si l'on en a quelque partie, on la garde dans les cabinets comme une grande curiosité. Celle que nous trouvons chez les Droguistes, vient des cadavres de diverses personnes que les Juifs, ou même les Chrétiens, embaument, après ies avoir vuidés de leurs entrailles et de leur cervelle, avec de la myrrhe, de l'aloës, de l'encens, du bitume de Judée et plusieurs autres drogues: ils mettent sécher au four ces corps embaumés pour les priver de toute leur humidité phlegmatique, et pour y faire pénétrer les gommés afin qu'ils puissent se conserver.* It was the animal oil and volatile salts contained in the human body, upon which the good Doctor seems to have founded his belief in the powers of Mummy, which he commends as "detersive, vulnerary, resolvent, resisting gangrene, corroborative, proper for contusions, and to prevent the blood from curdling in the body." The Arabian Physicians seem to have had more reasonable notions on the subject. "The *Múmiyá* of tombs," says Ibn Baítár, "which is found in great quantities in Egypt, is nothing more than an amalgam anciently used by the Greeks, (*El-rúm*.) to preserve their dead bodies from putrefaction." He also applies the term *Múmiá* to the Jewish bitumen (*al kafr al yehúdí*) or asphaltus, and adds that the same name is also given to a kind of light, black stones found near Sen'á in Yemen, each of which contains a black fluid substance in a small cavity. It is indeed in cavities of rocks and stones that the *Múmiá* of the Persians is found, and the best is that collected in the Mummy Mountain, (*Kúhi Mumiyái*, Sir William Ouseley's *Travels*, ii. 117.) about twenty miles, or six farsangs, from Dáráb-gird or Dárá, (in 29° North and 54° 50' East,) one of the most ancient cities in that Country. A small cavern or pit about twelve feet deep, (*Geminam orgyiam*, Kœmpfer, 518.) at the foot of the mountain, is the place in which it is found; and, at the very hottest season of the year, the Governor of the Provinces of Lár and Dáráb, to the latter of which the mountain belongs, goes in great state to collect this precious substance, and send it to the Royal Treasury. Twenty powerful men set their shoulders to the huge mass of rock by which the entrance of the cavern is blocked up, and when it is removed, a man is sent in with an iron ladle to scrape the asphaltus from the crevices through which it exudes. But he is first stripped naked, and his mouth is filled with clean water, to prevent his concealing any of the *Múmiá* which he may find. The Governor and his attendants dine in a tent pitched before the mouth of the cavern, while the scarification of its walls is going on; and on issuing from the pit, the scarifier is expected to discharge the contents of his mouth in presence of the company, that they may see that no deception has been practised. A very singular and rigorous examination of his person also follows, so great is the apprehension lest any of this invaluable specific should be embezzled. The *Múmiá* is then liquefied and cleansed upon the spot, and the

True
Mumia.

* Now more correctly spelt *Momie*.

MUMMY. whole, usually about twenty-five miskáls, (a little more than four ounces,) is sealed up in a silver box formed for that express purpose, and despatched by a courier to the Court. Kœmpfer ascertained by an experiment on the leg of a fowl that its efficacy was more apparent than real; (524.) that in fact it gave an extraordinary density and induration to the periosteum, and thus enabled the animal to use its limb sooner than could have been expected; but, he adds, that, on subsequent trials, an inferior sort promoted the formation of callus even more rapidly than he thought desirable. The Persians still hold it in the same estimation, and some was brought in 1809, as a present for the Queen of England, by the Persian Ambassador, Mírzá Abú-l Hhasan; nine tó máns (about £8) being then demanded at Isfahán, for as much as would fill "a common sized walnut-shell;" (Ouseley, ii. 121.) but when its efficacy was tried by an experiment similar to that made by Kœmpfer, Mr. Sharp, Sir Gore Ouseley's surgeon, declared that he believed "the application of any common bitumen would have been attended with equal success." (Ouseley, ii. 117.)* The resemblance and supposed identity between the Persian Múmíá and the bituminous matter found in bodies embalmed by the Egyptians, as it occasioned the collection of the latter from the Catacombs, and enhanced its value in the estimation of the Arabs, so did it convince them, that a desire of procuring it was the motive which led the Franks to inquire so constantly for bodies from the Egyptian Mummy pits. Nor, till lately, could a more effectual method have been devised for causing the destruction of those precious relics, than this demand for Mummy, (Múmíá,) which, in the estimation of the Arab, was most easily to be procured by knocking the carcass containing it to pieces. Now indeed the case is widely different; and the peasants throughout Egypt, from their constant intercourse with Europeans, are well aware of the value of every appendage of a Mummy. So many also have been carefully examined, and the Catacombs containing them accurately described, that the sepulchral decorations and modes of interment used by the Egyptians are now far better known, than, till within a very few years, there was any prospect that they ever would become.

Embalmed
bodies.

Ancient ac-
counts.

It will be proper, however, before the modern discoveries are mentioned, to notice the accounts given by the Ancients. "As soon as any person of consequence dies," says Herodotus, (ii. 85.) "all the women of his family perambulate the town, accompanied by all their female relations, having their head and face smeared with mud, and beating their naked bosoms, beneath which their clothes are fastened by a girdle: the men, on the other hand, uncover and beat their breasts in like manner." A rigid abstinence from all luxuries was maintained, and the same rites were continued till the body was delivered to the embalmers; for there were functionaries legally appointed to perform that office, who, "so soon as a corpse was brought to them, showed the bearers painted wooden models, faithfully representing bodies embalmed according to the three different degrees of care and expense prescribed." The first, which represented Osiris,† was said to cost a

* Inferior kinds, called *Schebbenád* and *Champeh*, from the places in which they are found, are brought from the adjoining mountains, and all bear a great resemblance to a fluid substance which issues from a mountain three miles from Bákú. (Kœmpfer, 520.)

† Herodotus (ii. 86.) says, "The finest pattern represented him

talent of silver; (£230;) the second twenty minæ; (£76;) and the third, and humblest, a very small sum. (Diod. Sic. i. 91.) The body was then left with the embalmers; if the deceased were a male, probably on the day of his death; but if a female, three or four days later. (Herod. ii. 89.) The process of embalming occupied seventy days, the period of mourning among the Egyptians, (Gen. 1. 3.) after which the corpse was swathed in cerecloths, and returned to the family, who enclosed it in a wooden case, imitating the human form, (*ἀνθρωποειδέα*), and placed it upright against the wall in a sepulchral chamber. (*οἰκήματι θεκαίῳ*.) Whenever the body of any one who had been carried off by a crocodile, or drowned in the river, was found, the city within the territory of which it fell, was obliged to have it embalmed in the most expensive manner; and no one, except the Priests of the Nile, were allowed to touch it. (Herod. ii. 90.) "The embalmers of bodies," (*τὰ σώματα θεραπεύοντες*), says Diodorus Siculus, (i. 91.) "are artists (*τεχνίται*) who have received this art (*ἐπιστήμην*) by inheritance from their forefathers. These men, when they have delivered to the relations of the deceased an account of all that must be expended on the funeral, inquire in what manner they wish the body to be embalmed; and when they have agreed about every thing, and have received the corpse, they deliver it up to those appointed to perform the usual offices about it. First, the *drawer*, (*ὁ γραμματεὺς*), having laid the body on the ground, marks, by a line on its left flank, (*λαγόνᾳ*), how much it is necessary to cut; then the *slitter* (*ὁ παρασχίστης*) takes an Æthiopic stone,* and having made such an incision in the flesh as the law allows, immediately runs away, being pursued by those present, who throw stones at him and curse him, as if they wished to throw the horror of the action upon him; for they consider every one who commits any violence, inflicts any wound, or does any injury whatever to the body of one of his own species, as detestable. When the picklers (*οἱ ταριχευταί*) have been assembled for the purpose of embalming (*πρὸς τὴν θεραπείαν*) the opened body, one of them thrusts his hand through the incision in it as far as the breast, (*εἰς τὸν θώρακα*), and removes every thing except the kidneys and the heart; another cleanses each of the intestines, injecting palm-wine and aromatic drugs." The brain, as we learn from Herodotus, (ii. 86.) had been previously extracted through the nostrils, partly by a crooked iron, (*σιδήρῳ*), partly by the injection of drugs. (*φάρμακα*.) "When the intestines have been removed," he adds, "the cavity is cleaned out,† well soaked with palm-wine and pounded aromatics, and then is sewed up again, after it has been filled with pure myrrh pulverized, cinnamon,‡ and

Taricheutæ.

whose name I think it sacrilegious to mention in such a matter." Athenagoras (*Legat.* § 25. p. 115.) understood Osiris to be the God here meant; and this is confirmed by the Legends on the monuments and sepulchral documents lately interpreted, which all begin—Osiris, or the Osirian—N. N. i. e. he who is now united with Osiris. (Champollion, *Seconde Lettre*, p. 112. *Précis*, 173. 260.)

* Egyptian pebbles, of pyromachous silex, according to M. Brogniart, Passalacqua, p. 223.

† "Strained or percolated;" the proper sense of the word (*διηθεύσαι*) used in the original, is more applicable to Larcher's version, in which *κοιλίην* is taken for the intestines, and *νηδὺν* for the cavity containing them, than that here given; but Schweighæuser, in his notes on this passage, has shown that both those words have here the same meaning.

‡ *Κασίης*, (Herod. ii. 86.) *κινναμόμῳ*, (Diodor. Sic. B. H. i. 91.) probably the *Laurus cassia*, or Bastard Cinnamon of modern Botanists.

MUMMY. the other aromatics, (*θυμιάτων*;) except frankincense. (*λίβανωτον*.) When all this has been done, they pickle (*ταριχώνουσι*) the body, covering it with natron (*λίτρω*; fixed alkali, or impure carbonate of soda) for seventy days, beyond which it is not lawful to keep it in pickle. When withdrawn from the natron, it is completely swathed with bandages of cotton cloth coated with gum, (*κόμμι*, i. e. the gum of the *Acacia vera*, or *Nilotica*, commonly called gum Arabic,) which is much used by the Egyptians as gluten. (*κόλλα*.) The latter part of the embalming process was performed, as appears from papyri lately discovered, (Peyron, *Papyri Ægypt.* i. 89.) by a peculiar class of Priests, of the lowest order, yet possessed of great privileges, and much respected by their Countrymen.* They were styled *Cholchytæ*, or *swathers*; for such is probably the meaning of their title in the Egyptian Language, and they received the body from the *Taricheutæ*, when embalmed and washed, for the purpose of swathing it, according to the prescribed rules, and delivering it in a proper state to the surviving relations. As every thing in the Religion of Egypt was symbolical, (Peyron, 82.) so, no doubt, was the mode in which the embalmed bodies were swathed. The bandages of Mummies are sometimes crossed, at others laid obliquely or straight. These and their various ornaments and appendages were all doubtless symbolical of the embalmed body of Osiris, which was carried about by Isis; (Plutarch, *de Iside et Osir.*) and Damascius (Phot. *Biblioth. Cod.* ccxlii.) expressly calls these "the bandages (*περιβολαί*) of Osiris." The intestines, of which the abstraction alone is mentioned by Herodotus and Diodorus, were, as we learn from Porphyry, (*De Abstinentiâ*, iv. 10.) enclosed in a box, which was thrown into the Nile after one of the embalmers had uttered this prayer: "O Sun, Sovereign Lord, and all ye Gods who have given life to men, receive me, and suffer me to dwell with the eternal Gods. I have continued during my whole life to worship the Gods as I was taught by my forefathers; I have always honoured those who engendered this body; I have killed no man; I have never embezzled that which was intrusted to me. I have done no other evil. If I have been guilty of any other fault in the course of my life, whether in eating or in drinking, (I was so) not for the sake of myself, but for the sake of these things!"

Funeral. The Funeral, which was sometimes deferred for several months, was no less remarkable. "The relations of the deceased," says Diodorus, (i. 92.) for Herodotus has not noticed these singular rites, "announce the day of his Funeral to his judges, relations, and friends, and fix it by saying that on such a day he will cross the lake of his Nome. The judges then come, more than forty in number, and place themselves on a semicircular seat prepared on the other side of the lake; and the *baris*, or sacred barge, is launched, having been previously prepared by those who have the direction of these rites. The *baris* is guided by a steersman, (*πρωρεὺς*;) called by the Egyptians, in their own Language, *Charon*. After the barge has been launched, before the coffin containing the dead body is placed in it, whoever pleases is allowed by the law to bring his accusations. If any therefore come forward, and prove that the deceased led a wicked life, the judges pronounce sentence against

him, and his body is excluded from the usual interment; but the accuser, should it appear that he brought an unjust accusation, falls under very heavy penalties. When no accusation is brought, or the accuser is convicted of calumny, the relations, laying aside their mourning, pronounce an encomium on the deceased, saying nothing about his family, as is usual among the Greeks, because they think that all Egyptians are equally noble; but enlarging upon his education and instruction from his infancy; his piety, integrity, temperance, and other virtues after he attained manhood; and entreating the Infernal Gods to receive him as an inhabitant of the abode of the Blessed. The multitude joins in this prayer, and unites in extolling the glory of the deceased, as one who will dwell for ever with the Blessed in Hades. Those who have private sepulchres place their bodies in the cells (*θήκαις*) prepared for them; those who do not possess one, build a new chamber in their house, and place the coffins upright against the most solid wall of that chamber. The bodies of those who have been debarred from sepulture, either on account of the charges brought against them, or of debts unpaid, are deposited in their own dwellings; and sometimes, when their children's children have become wealthy, and they themselves have been cleared of criminal charges and debts, they obtain a splendid Funeral." The accuracy of these details appears distinctly on unfolding Mummies still preserved, and the contents of the records attached to them, or delineated on their coverings, imperfectly as they can yet be deciphered, still further corroborate this testimony. The bodies examined by the French while in Egypt (De Sacy, *Abdu-l latif*, p. 269.) had all an incision on the left side for the extraction of the entrails, and the women had their arms stretched out straight, while those of the men were crossed over their breasts. But few travellers have been more diligent or successful in their researches than Signior Giuseppe Passalacqua,* of Trieste; to his observations, therefore, we are indebted for the further details on this subject.

Every City had a general *Necropolis*, or Cemetery, with very few exceptions, on its Western side, always above the level of the water in the highest inundations, and usually excavated in the side of the Great Libyan chain of hills which forms the Western boundary of Egypt. That of Thebes, the Great Diospolis, vastly exceeds, as might be expected, all the rest in extent and magnificence. The contrast between the external simplicity and internal magnificence of these Tombs is peculiarly striking. The entrance of the galleries or pits leading to them, which is usually blocked up by large stones, is not distinguished by any outward mark or ornament; and in many cases, if not in all, the approach was carefully concealed. (Passalacqua, 119. 191.) The only Royal Tombs hitherto discovered, are the *Bîbân-el-mulûk*, (Royal Gates,) near Thebes, in a dreary rocky valley separated from the rest of the Necropolis by a chain of hills. Of the forty Tombs mentioned by Strabo, (xvii. l. 46.) and forty-seven by Diodorus, (i. 46.) twenty-five only have been traced in modern times. Nor can this

Entombment.

Modern accounts.
Necropolis, or Public Cemetery.

* M. Peyron (p. 84.) justly supposes that the honours mentioned by Diodorus (i. 91.) as given to the *Taricheutæ*, were really paid only to the *Cholchytæ*.

* It is said, that the splendid Collection of Egyptian antiquities exhibited by him at Paris, the catalogue of which fills an octavo volume, would have been brought to this Country in preference to France, but for the heavy duty to be paid on landing it. Such taxes add little to the revenue, but are a heavy drawback on knowledge; it is therefore creditable to the Government of France that they do not exist in that Country.

MUMMY. create any surprise, as the Historian last-named says, that only seventeen were remaining in the time of Ptolemy, son of Lagus, (300 B. C.) "most of which had been ruined," he adds, "at the time when we visited (*παρεβόλομεν*) those places in the 180th Olympiad." (60-59 B. C.) That discovered by Belzoni, is apart from the rest, and was probably not comprehended within those numbers. The opening in the face of the rock leads through long and narrow passages, sometimes horizontal, at others inclined at a considerable angle, and at others forming a staircase to chambers from ten to twenty-five feet high, and proportionably long and wide. The sides of these passages are usually ornamented with bas-reliefs, and often communicate with small sepulchral chambers; but those to which they lead are richly painted and sculptured, and are often passage-cells connected with corridors, staircases, or gradual descents, which terminate in the most spacious and majestic chamber, containing the remains of a sarcophagus, which shows that this was the place where the body of the Prince was deposited. The barbarous spoiliations of Cambyses, nearly five centuries before the beginning of our era, probably left few of these depositaries untouched; and the sarcophagi, in both the Royal Tomb and the Pyramid opened by Belzoni in 1817, though the approach to them was carefully closed, had been completely rifled. A hollow wooden statue of the Mitred Osiris, placed in an erect position, near the sarcophagus, usually contained a very large roll of papyrus, covered with the funereal ritual, sometimes, but very rarely, both in the hieroglyphic and hieratic character. The Mummy of the King himself appears to have been preserved in a sarcophagus of alabaster; and around it were placed small wooden images of Mummies, representing those of his friends and family deposited near him. The Pyramids, which we know to have been the mausoleums of the Memphitic Dynasty, were probably considered as symbolical representations of mountains, and were traversed by corridors and chambers, constructed in the same manner as those hewn out of the natural rock near Thebes.

Private sepulchres. The Tombs of distinguished families or individuals are not less extensive and splendid than the Royal sepulchres, but are mingled with common burial-places, and placed in the middle of the general Cemetery. Their decorations also are executed in an inferior style, yet those of the private sepulchres at Thebes are equal to the best in the Necropolises of Abydos, Heliopolis, Hermopolis, &c. Most of these Tombs have one or more pits in some place not likely to attract notice; and these pits, which are always rectangular, and of various depths, terminate in the entrance of one or more small sepulchral chambers, generally filled up with rubbish, fragments of Mummies, Mummy-cases, &c.; melancholy evidences of the barbarism and cupidity of those who ransacked these hiding-places in search of treasures. The outer face of such Tombs is sometimes, though rarely, ornamented with bas-reliefs and hieroglyphic legends, though their inmost chambers have been so carefully concealed; and the observer is thus reminded of the splendid Temple which formed the Tomb of Osymandyas, (Diod. Sic. i. 47.) whose statue seemed, by the inscription beneath it, to defy the spectator to discover where his body lay. A few of the least conspicuous of these chambers have been found unopened: their contents were, in some cases, much injured by the effects of time; in others, they contained very fine Mummies symmetrically

arranged, and accompanied by large and remarkable Tomb-stones, (*stélé*), with other funereal decorations. The burial-places belonging to private families were probably those, which, accessible only by pits, are found singly, and dispersed in different parts of the Necropolis. They have usually one or more sepulchral chambers on opposite sides at the bottom, or in different stages one over the other. In these chambers the Mummies are found as originally placed; and it is remarkable that, with very few exceptions, all are laid horizontally, not vertically, contrary to the express declaration of Diodorus. The principal Mummy is always placed in the centre of the chamber, or at the bottom of the pit, the rest in parallel lines near each other, and almost always with their feet turned towards the entrance.

There are in every Egyptian Necropolis hitherto explored, catacombs distinguished from the rest by their vast extent; consisting generally of a simple corridor from eight to ten feet wide, varying in height, and penetrating far into the body of the mountain from which it is excavated. These galleries run in every direction, and are sometimes made to terminate by turnings and slopes at an opening beneath their entrance. They differ from each other merely in the number of chambers occurring from time to time, in occasional projections or cavities in their walls, and in the pits found here and there within them. Their extent, simplicity of structure, and total want of ornament, as well as the immense quantity of broken Mummies which they contain, all show that these were the Public Cemeteries of the neighbouring City. Those of Thebes are large enough to admit many thousand bodies, and still to leave room for passengers; and in most cases they bear evident marks of the action of fire. Wherever these crypts are sufficiently uninjured to give a notion of their original state, the Mummies in them are found heaped upon each other with no other covering than a simple wrapper of cloth. In Thebes alone, fragments of coffins and sepulchral ornaments occur in the ruins of these Public Cemeteries; and M. Passalacqua had the good fortune to find in one of them, some perfect Mummies inclosed in coffins, and decorated with curious or valuable ornaments. He had observed, that the Public Tombs had almost always a large front cut perpendicularly in the side of the mountain with a broad horizontal platform hewn out of the rock before their entrance. Guided by these indications, he discovered near his lodging at Gúrnah, (*Kúrnah*), a front nearly twenty feet high and thirty feet wide. The whole of it, as well as the terrace before it, had been carefully concealed by stones, sand, and earth. Its entrance in the centre, about nine feet wide, and nearly as high, was closed by a wall of unbaked bricks, which showed no signs of their having ever been displaced. Before this entrance there were buried a number of little wooden figures, representing Mummies inclosed in coffins, and intended, no doubt, as indications of the bodies deposited in this sepulchre. On removing the wall, the whole entrance from top to bottom, was found to be filled with Mummies and coffins in a good state of preservation, heaped one upon another. On displacing those which obstructed the passage, others appeared in various degrees of preservation, piled one upon another, all along the sides of the corridor, which extended horizontally, with the same dimensions, for fifty feet into the hill. Here the earth from above was found to have fallen in. M. Passalacqua, however, did not lose courage; but by means of planks and beams prevented the

General Cemetery.

Unopened gallery.

Al Kurnah.

MUMMY. influx of fresh earth, and made a covered way, through which his labourers could remove the stones and sand obstructing their progress. Four days were employed in examining the part of the gallery still entire, and in a few more, they made a narrow passage through the rubbish into its continuation further inwards. An Arab crept in with a flambeau, and the noise of the stones which rolled under him as he slid down, together with the echo of his footsteps as he advanced on the other side of the breach, immediately created a suspicion of what proved to be the fact, that there was a greater void beyond it. All had been ransacked and burned. On penetrating further in a straight line for about 100 feet, the gallery was found to divide into two diverging branches, which, by turnings and an insensible inclination towards a level from ten to fifteen feet lower, gained a direction opposite to that of the entrance. The left gallery terminated without any issue not far from its commencement. That on the right led at length, by many windings, to a vast sepulchral chamber, which communicated with a Tomb above by means of a rude ascent. This chamber had been discovered, and was used as a hiding-place for his property, by the Arab who inhabited the Tomb above, which was probably the original entrance to this extensive catacomb. It was there that, amidst the most ordinary Mummies, those belonging to Artists were found. They were distinguished by the instruments indicative of their occupations, inclosed in their coffins: beside the Painter lay his pallet; the Scribe had his brush and colours; the Land-surveyor, his measuring-cord; the Hunter his bow and arrows; the Fisherman his net; the Labourer his wooden hoe. It was there also that one of the most richly ornamented Mummies yet discovered was found. In a few instances the dead were buried separately at different depths from three to ten feet, and sometimes, but rarely, apart from, though near the family catacomb. The former were probably debtors or malefactors, the latter dependents of the family.

Mummy cases.

Covering of Mummies.

The coffins, or cases, are usually in the form of a Mummy, and sometimes doubled, or trebled, or even quadrupled; those of a rectangular form are least common. Stone, wood, or a kind of *papier-mâché* made of strips of cloth glued together are their ordinary materials. Some are quite plain; others covered with hieroglyphics within and without. Those of stone have their hieroglyphics engraved either in intaglio or relief. The Mummies of women were sometimes buried in cases made for men, and *vice versa*; the exterior, moreover, is no just criterion of the state of the interior, for plain, unornamented cases have been found to contain the richest Mummies. In general, the bottom only of these cases is movable, and the inner ones are slit, and laced through their whole length behind. All the Mummies now found are enveloped in some kind of covering, either a simple wrapper, or one or more of the above cases. The body is swathed in long, narrow bandages, having the legs and arms sometimes separately bound up, at others without any intervening substance. Sometimes large pieces of cloth are laid over these bandages, and fastened by narrower strips bound round them. The more ornamented Mummies which have no case are usually covered with a mosaic of coloured glass beads into which various amulets are occasionally worked up. One in M. Passalacqua's Collection (No. 1534.) represents the face and head of the Mummy; its broad neck-lace; a sacred beetle with expanded wings; a winged

Divinity standing; the Four Genii of Amenti, (Hades,) and a column of hieroglyphics. The Mummies with Greek inscriptions are either 1. in every respect similar to those strictly Egyptian, or distinguished by gilding on their faces, and gold sheaths on their fingers; or 2. they differ entirely in style and position from those of the genuine Egyptians. The outline of the body in the latter is much less distinct than in the former, the coffin of which is almost always rectangular and painted white, and has the name of the deceased in red or black Greek letters, and few, if any, hieroglyphics on the cover. The amulets also, which are made of wax, are gilt in the Greek, but not gilt in the Egyptian Mummies. These peculiarities appear to mark different epochs, and if MS. documents are found with such Mummies, some clue to their respective Ages may hereafter be discovered. The body is always laid flat on its back, with its arms either crossed over its breast, straight along its sides, or one bent and the other straight. The first is the case with grown up women, the second with men. The left hand of the Egyptian is always clenched and often contains a ring or amulet: the Greeks have each hand straight and open. In the process of embalming, the sphenoid and ethmoid bones at the upper part and back of the nose were broken, in order to facilitate the extraction of the brain, which was replaced by a mixture of silicious sand and asphaltus with a very small quantity of clay. (Pass. 286.) The abdomen, when cleared, was filled with chips and sawdust of cedar, and a small quantity of natron; and Diodorus expressly says, (i. 9.) that such drugs were used as would not only secure the preservation of the body for a length of time, but also give it a fragrant odour. All the natural orifices in the head were filled with little bits of cloth, and in Greek Mummies small plates of silver gilt were laid upon the eyes and mouth. (Pass. 185.) Either placed on the ground near the Mummy, or buried in cases made expressly for them, there are usually four jars, the covers of which represent the head of a man, a baboon, (*cynocephalus*), a jackal, and a hawk, placed two and two, and looking towards each other. These are the four Genii of the Infernal Regions, Amset, Hapi, Sumautf, and Kebh-Sniv, (Cailliaud, iv. 54.) of which little figures in wax, together with the eye symbolical of Osiris, are usually found in the empty cavity of the trunk. This is the more worthy of observation, as the above-mentioned vases commonly contained the bowels of the deceased, embalmed with a mixture of sand and asphaltus. (Pass. 286.) These vases, commonly called by Antiquaries *Canopi*, are found in or near the sepulchre. Above it are buried cylindrical earthen vessels two feet long, and six inches in diameter, filled with little packets of natron mixed with cedar dust and bloody rags alternately. These are supposed to be the rags used to wipe the embalmer's fingers, preserved thus carefully, that not a drop of blood should be lost.*

Position of body.

Embalming process.

Canopi.

Bloody rags.

A short description of the unopened sepulchre discovered by M. Passalacqua, and of the Mummy of Ammonius brought from Egypt by M. Cailliaud, will still further illustrate, though at the hazard of a few repetitions, this subject hitherto so imperfectly understood. On carefully examining a place in the great central valley of the Necropolis at Thebes, the former of those travellers suspected that a Mummy-pit was con-

* Perhaps the Egyptians identified the blood with the life of the animal. Compare *Gen.* ix. 4.

MUMMY.
Unopened
Tomb.

sealed under the rubbish. A quadrangular pit with due dimensions was soon found, cleared out, and at the depth of six feet a doorway made its appearance; but alas! when the chamber into which it opened, was explored, half-burnt coffins showed that devastation had been at work there of old, and the modern excavators seemed to have laboured in vain. M. Passalacqua was, however, too persevering to be easily disheartened. Another doorway on the opposite side might be looked for: he probed the soil with his *jerid* (palm-rod) and found they had not reached the bottom. After half an hour's work, the top of another doorway was seen, it was walled up. Passalacqua's heart beat high, the Arabs worked hard, the wall was laid bare, and he could hardly resolve to have it knocked down. Mohammed his faithful attendant had no sooner thrust his head through a hole, than he shouted out for joy, "Come down, come down, and see the finest things we have ever seen in all our searches!" Passalacqua lost no time, scrambled down without a ladder, was blinded by too rapid a passage from broad daylight into utter darkness, could see nothing when he had crept into the Tomb, and was almost stifled for want of air. When recovered from his extasies he called Mr. Madox, a Londoner, who happened to be there, and Yanni d'Anastási, Mr. Salt's collector, to come and witness his good fortune. Five or six feet below the surface of the ground, they discovered the mouth of the pit; six feet deeper on its Southern side, was the entrance to the ransacked chamber, and just below it, on the opposite side, that which had never been opened, blocked up with unbaked bricks. When they had been removed, a chamber four feet high, five feet six inches wide, and nine feet six inches long, appeared containing a large wooden coffin placed at an equal distance from the side walls, on the left side of which were lying on the ground an ox's head with the blade-bone and other bones of the right shoulder, four earthen vessels, and two large dishes covered with small cakes of a blackish paste placed on beds of sycamore twigs, the leaves of which were still perfect. Between these dishes, and a third like them, was a small female statue in an erect posture, corresponding with a similar one on the opposite side, placed between the models of two boats or barges. Between the head of the coffin and the wall there was just room enough for a wooden pillow. The coffin, when opened, was found to contain two more, one within the other, in the innermost of which was the Mummy. The outer coffin, made of sycamore-wood, is curved, and three inches nine lines high at its upper, two inches eight lines at its lower and angular extremity. It is two feet six inches wide, and seven feet four inches six lines long, is adorned with a cornice, and has nearly the shape of the canopy (*naos*) held over Divinities when receiving homage or oblations. Six square laths of wood placed under the coffin, raised it some inches from the floor of the chamber. This external case is painted within and without; the picture of a house or palace is repeated outside in various compartments, separated by a column of hieroglyphics which appear to signify, "..... deceased, devoted to the great God Osiris, Lord of the House of Amenti." Inside, there are on the cover sixty-five columns of hieroglyphics in red and black, bordered by stripes of different colours; and on the sides and bottom, inscriptions, frizes, and compartments filled with pictures, each explained by a hieroglyphic legend above. The legends all begin from the head of

Outer
coffin.

the Mummy towards which the figures in the hieroglyphics are every where turned. The second coffin has a very heavy lid, angular without, and concave within. It is, like the former, covered with paintings and legends both inside and outside. The characters here appear to be hieratic, and from the quantity of bows, arrows, &c. represented with large numbers annexed, it is probable that the deceased was a manufacturer of arms. The third coffin is ornamented much in the same way as the first; and the eye, symbolical of Osiris, appears only on the doors painted on the left side, that on which the body was opened; and as Osiris presides over Amenti or Hades, these gates probably signified "the Gates of Hell." The Mummy contained in it, rolled up in a fringed sheet, had a very plain collar of glazed earthenware round its neck, and there was lying upon its breast a small wooden statue of a man very simply attired, apparently a Priest, and probably an image of the deceased, as the inscription beneath, when interpreted, will perhaps ascertain. The body crumbled away when moved and exposed to the air.

MUMMY.
Second
coffin.

Third
coffin.

The Mummy brought from Egypt by M. Cailliaud, is in a high state of preservation; and contained among other wrappers a piece containing three napkins which had never been used, and were so perfect as to bear washing; there were also some shirts which had been pieced and mended. A long fringed scarf was found marked with the letters AM, the initials of the deceased: for he was of a Græco-Egyptian family as the style of the decorations showed. Small plates of gold representing the eyes and tongue were found on his eyes and mouth, which was carefully closed in compliance with the Grecian usage, (Letronne in Cailliaud, iv. 13.) instead of being left open as was usual among the Egyptians. An olive wreath of copper gilt encircled his temples. His breast, body, and arms were gilt. The outline of the face is more nearly perpendicular, and the forehead less inclined than in Egyptian Mummies. The hair, fine and curly, retains all its pliancy. On the coffin is an inscription in Greek capitals thus transcribed by M. Letronne: Πετεμένων ὁ καὶ Ἀμμώνιος Σωτήρος Κορνηλίου Πολλίου, Μητρὸς Κλεοπάτρας Ἀμμωνίου, ἐτῶν εἴκοσι ἐνὸς, μηνῶν δ' καὶ ἡμερῶν εἴκοσι δύο, ἐτελεύτησε ἱεὺς Τραϊανοῦ τοῦ κυρίου, Παῦμι η'. i. e. Petemenou, that is to say Ammonius, son of Soter, son of Cornelius Pollius and Cleopatra, daughter of Ammonius, died aged 21 years, 4 months, and 22 days, on the 8th day of Payni, in the year 19 of our Sovereign Lord Trajan (2 June A. D. 116.) The grandfather of Petemenon, as appears from another coffin taken from the same sepulchre, was Archon or Chief Magistrate of Thebes; which accounts for the splendour of his funereal ornaments. His grandmother (Philút) and sister-in-law (Sarapút) appear to have been of Egyptian origin; we learn, therefore, from these monuments, says M. Letronne, that under the Roman Government there were distinguished families of a mixed descent established in Egypt; and that such were employed by the Romans in the administration of the Country. We learn, also, from the decorations of this Mummy, that the Greeks, on adopting the Religion of Egypt, still retained many usages peculiar to themselves. The sepulchre in the hill near Kurnah where these Mummies were found, (one of which was purchased by Mr. Grey and another by Mr. Salt,) contained two more, and the coffin of a third, procured by Mr. Salt, and one or two by Drovetti. The Antiquaries, therefore, at Paris and Turin, where

Cailliaud's
Mummy.

MUMMY. Salt's and Drovetti's collections are now preserved, will have opportunities of collecting more data from these remains which have already thrown so much light on the state of Religion and civilization in Egypt under the Romans.

Sepulchral
Ritual.

Beneath the first folds of the bandages round this Mummy a roll of papyrus was so placed as to be visible on removing the lid of its case. It is about 19½ inches deep by 8¾ in breadth, and is docketed on the outside with the name of the deceased in the Greek and Demotic characters, and the title of the roll; viz. "The manifold transmigrations of Petemenoph born of Cleopatra." It is an extract or abridgement of the Sepulchral Ritual in a very indifferent hand, as is usually the case in papyri of so late a date. The Complete Ritual, as found with the larger and more ancient Mummies, is entitled *Jom an Rôu na hort hem hrû ré, i. e.* "Book of the Gates concerning the Manifestation to Light;" and contains a complete collection of precepts relative to the embalming and entombing of the dead, with prayers to the Divinities presiding over Amenti (Hades) and the Mystic regions inhabited by the Soul before it recommences its transmigrations. The whole, or a considerable part of this Ritual, is found with the older Mummies; and the extracts from it become shorter in proportion as the Mummies are more modern; M. Champollion the younger has thus translated that which was attached to the Mummy of Ammonius. (Cailliaud, iv. 29. pl. lxi. No. 2 and 3.)

(1.) To him Osiris Pet-amen-oph, (*i. e.* Ammonius,) born of Cleopatra, also named Genneticè. (Γεννητική.)
(2.) Great is the God Ré (the Sun) by his diadems! Great is Atmú by his productions! Great is Osiris Pet-hem-p-Amente-s, (inhabiting the West, *i. e.* Dionysus,) by his sceptre of Pas-sú-Ré! Be propitious to him, (Ammonius,) ye who guard the gates of (3.) the Western Country; ye the two guardians of the divine mothers of the dwelling of Siú, (the Stars, *i. e.* Spirits,) guardians of the gates of the divine dwelling where are the lotuses, the water, and the divine barge; (*bari*;) be propitious to him, thou, Anubis, son of Osiris, guardian (4.) of the guardians of the gates of the two divine generators of the dwelling of Siú; be favourable to him, ye, Gods of the regions of Matos, assessors of Osiris, assessors in the dwelling of Oskh, (the harvest,) the two divine (Goddesses of) Truth in the fields of Oên-ro; (Elysium;) be thou favourable to him, Goddess Hathor, (Venus,) who art the Goddess Neïth (5.) in the Eastern Country, and the Goddess Smé (Justice) in the lotuses and the waters. . . . of the Western Country; be propitious to him ye Gods of the dwelling of Siú, your domain; be propitious to him, (Gods) (6.) who watch beside Osiris! Great is your father the Sun! the Hawk of the Universe, (*i. e.* the active principle of the Universe,) who hath made manifest you and himself in the dwellings of Sóp! Great is Horus, the Son of Isis, (7.) the son of Osiris, who is upon . . . his dwelling for ever! Great is Har-oëri, (Arueris,) Lord of the Solar Spirits, beneficent eye of the Sun, &c. In the following line (8.) there are invocations of Horus twice-beloved, master of the dwelling of Sakhem; (9.) of the (Goddess) sovereign guardian of the regions of Matos, who drives away the impure; of the God Thoth, the second Hermes, the God A. (10.) The Gods of the dwelling of Siú, are then besought to cause the Soul of Petamenoph to be admitted into heaven with the Spirits of the supreme Gods; (11. 12.) the God Atmú is entreated to

receive him; (13.) may he (Aramonius) be purified in the holy waters of the dwelling called Thy-oëri, like the Oëri of Oëris, (Chief of Chiefs,) who are in the regions of Masj; may he be led into all the regions of Masj, where there are all the Gods and Goddesses of the Upper Region! (14, 15.) and enter into the lower regions of Osiris, Lord of the West, with the other Gods of Pas-sú-Ré, (16.) when his Soul will be placed on the *bari* (barge) of years. (17. 18.) Thoth is entreated to conduct him and do for his Soul what he did for Osiris, when he died during his manifestation on Earth. (20 to 25.) Six different invocations of the God A (Thoth) follow, entreating him to recommend the deceased to the Divinities of the eight regions over which he presides; then two supplications to the Lord of Shop-Ri, (the second Hermes,) and to Phtha, (Vulcan,) father of the Gods, (26.) entreating him to be favourable to Ammonius, to open his mouth and cover his eyes as he (Phtha) did to Sokhari-Osiris in Thy-núb, (the golden habitation.) (27 to 30.) The Spirit of the divine Koht, the lion-headed Goddess of Memphis, the beloved of Phtha, is then supplicated to watch over the mouth, the feet, and the arms of Petemenon, and to open the gates of heaven for him, as she did for the Gods and Goddesses. (31.) Anubis is also besought to open for him the gates of the abode of Souls over which the Genii of the Sbê-heth preside; that is, the twenty-one gates which lead to the Palace of Osiris. (32 to 36.) Prayers are offered up for his admission into the different dwellings of the divine Spirits, especially that of Phtha. (36.) A final invocation of Thoth then commences: "Great is the divine Ibis manifested by Phtha, he who opens the gates of the visible world! Preserve his head; preserve his breast; preserve his mouth; preserve his arms, &c.; keep for him a house with food, beverage, oxen, geese; (38.) keep for him pure water; keep for him his eye for the visible world; keep for him his eye for the Region of Kel; (where the Souls are judged;) vivify him by the bread of the God Sv, (Saturn,) slake his thirst (39.) by the waters of the God Hap móú; (Nilus;) give him to drink, as a medicine, the waters called Jor; drench him with milk; grant to him wine; (40.) receive him: The transmigrations. . . . Great is the powerful God manifested in the World! . . . (41.) . . . they are for ever great!" The earthly and material images with which these invocations are filled, can all, says M. Champollion, (p. 44.) be proved to be symbolical; their materialism is only apparent; but, as he justly adds, the Psychological system of the Egyptians cannot be developed in any satisfactory manner, till we are better acquainted with the rank and offices of the Divinities, Demons, or Spirits, with whom their Upper and Lower Regions are peopled.

The figures painted on the cases of this Mummy have all, as might be expected, a relation to the subject of the Ritual, viz. the trial which the Soul was to sustain, and the Deities by whose intervention it was to pass through the different stages of its progress towards a second birth. Near the upper part of the outer case is a sacred barge, (*bari*;) on which is the beetle, a symbol of Phtha or Thore, Father of the Gods, upon the disk of the Sun, to which the head of the deceased is consecrated; and the disk is encircled by a serpent, the emblem of Eternity; two nameless Deities being seated on each side of it. Near the feet is the same symbol of Phtha, their guardian, (Cailliaud, iv. 40.) and beneath it are two jackals (emblems of Anubis) with the key of Hades hanging

Paintings,
First
Mummy
case.

MUMMY. from their necks. On one side of the lid, the lower region is typified by a bunch of lotus flowers. Osiris Petempamentes,* *i. e.* the Western or Infernal, is seated on his throne, beside his wife and sister Isis. An altar covered with flowers, loaves, fruits, and liquids, is before them; and Anubis, whose pshent (tiara) marks his rank in the upper regions, (heaven,) presents the deceased as a suppliant before the Judge of Amenti, (the West, *i. e.* the Infernal Regions.) This is to represent the trial of his *corporeal* offences as he appears here in his *bodily* form: the trial of his *mental* transgressions is represented on the other side, where Osiris, in the character of Phtha-Socharis,† indicated by a hawk's head, surmounted by the inner part of the pshent and two coloured plumes, (*Pantheon Egypt.* pl. ii.) is sitting as Judge, and before the altar stands the soul of the deceased in the form of a hawk with human hands and head, on which the funereal cone and lotus are seen. The Soul, thus symbolized, is pleading its cause, aided by Smé, (Truth and Justice,) represented by a female figure with a plume (the symbol of Smé) in the place of a head. The seven gates guarded by seven Genii, having a hawk's, baboon's, man's, jackal's, crocodile's, lion's, and vulture's head, are the Sbé Héth, or Seven Gates mentioned in the Ritual. They were situated in the fields of Oën-ro before the Palace of Osiris. (*Great Ritual*, iii. 2. iv.) These guards are twenty-one in number; and one of them is the God Otmú, with the title of Hfé, *i. e.* the serpent, and the form of a winged dragon with human arms and legs. Inside of this case, near the head, is the hawk with expanded wings sailing through the starry sky, and bearing a red disk, *i. e.* Phré, the Sun, symbolical of the Spirit which gives life and action to the Universe. Over the feet, is the Goddess Hathor, (Venus,) in the form of a yellow cow, couchant on an altar; in an act of adoration before her, is a bird with a human head crowned by a disk, *i. e.* one of the purified Spirits united with the Sun, whose leader is Haroëris, (Arueris,) "the beneficent eye of the Sun." This figure is probably meant to represent the Soul of Ammonius raised to that exalted rank in the course of its transmigrations. On the bottom of this case is Netphé, distinguished by the vase (*i. e.* the letter N) on her head, seated with her daughter Isis, and Hathor, in the Glebakh, (*i. e.* Persea,‡) pouring out streams of nourishment for the blessed. At her feet are the guardian jackals, emblems of Anubis. On the right side of the same coffin, the disk of the Sun, in the centre of which is Ammon-Cnuphis, (the intellectual Sun,) is borne on a sacred *bari* drawn by four jackals, and adored by four baboons, (*cynocephali*), the former referring to the solstices; the latter to the equinoxes. On the left side, the *bari*, accompanied as before, bears an image of

MUMMY. the Sun and Moon united. The interior of this case has also astronomical symbols. In the centre is the Goddess Tpé or Tiphé (*i. e.* the heaven personified) extending her arms and legs as if to occupy all space. Over her head, rays of light issue from the Sun placed in the sign of Capricorn, to indicate (January) the month in which Ammonius was born.* The serpent-headed beetles near the brow of Tiphé are still uninterpreted, but probably conceal some Astrological mystery. Twenty-four female figures, twelve on the right, and twelve on the left, each having a solar disk on her head, represent the twenty-four hours of the astronomic day; eight are painted yellow, eight green and eight red; the meaning of which is not yet known.† On the wrapper round the body of Ammonius, the central figure is that of Osiris-Socharis, with his complexion, as usual, green; and near his head the *baris* or sacred boats of the Sun and Moon, symbolized by a right and a left eye. The God is adored by two images of the deceased, in the form of Mummies only half bandaged up. On the right and left are all the Deities who take a part in the final judgment. On the right, Osiris-Serapis and his wife Isis; on the left Anubis, crowned with the pshent, presents the deceased to the God. Further towards the right, Thoth is recording the sentence on his tablets, and, on the left, appears the Egyptian Cerberus, a compound of a crocodile, lion, and hippopotamus, the guardian of the Palace of Osiris. Near him, the four sons of Osiris, his assessors in Amenti; Amset with a human head; Hapi with an ape's; Sûmautf with a jackal's and Keb'h Sniv with a hawk's, having blue, green, or yellow fillets in their hands, as if ready to bandage up the bodies of the deceased, whose intestines were considered as peculiarly their property.

The period at which the Art of Embalming ceased to be exercised in Egypt, has not yet been ascertained. St. Augustine, in the latter half of the IVth century, speaks (*Sermo*. 120. c. 12. *Op.* v. p. 1411.) of Mummies as being prepared in his days, and says they were called *Gabbara*; we may, therefore, conclude that till the Religion of Egypt had been supplanted by Christianity, this Art, together with others connected with their sacred rites, was still preserved by the Egyptians. Though Jacob Israelites. (*Gen.* 1. 2.) was embalmed as well as his son Joseph, (*Gen.* 1. 26.) the custom does not appear to have prevailed among the Jews, (*2 Chron.* xvi. 14. *Jerem.* xxxiv. 5.) and they seem to have bound up the bodies of the dead in cere-cloths, (*ὀθονία, κείρια*, *John* xi. 44. xix. 40.) with aromatic substances, (*ἀρώματα*), more for the purpose of counteracting the disagreeable consequences of putrefaction, than with any hope of preventing it.

The practice of embalming was not peculiar to the Egyptians. The Mummies of the Guanches in the

* Petempamentes (Πετμπάμηντες. Letronne, *Recherches*, p. 345.) is the Dionysus or Bacchus of the Greeks, and in Coptic Pete-m-p-amente signifies 'he who belongs to the Amenti,' 'he who presides over Amenti.' This is a very sufficient evidence that the Coptic was the vernacular Language of Egypt 150 years before the commencement of our era.

† Socharis (Σόχαρις) occurs in a passage of Cratinus quoted by Hesychius, (v. Παμύλης,) but the passage is so corrupt that nothing can be made of it, and, as it stands, Socharis seems to be a feminine name, not a masculine name.

‡ Still called Lebakh by the Arabs. It is the Hejlj (spelt Agihalid in Alpinus) or *Balanites Egyptiaca*, the *Ximema Egyptiaca* of the earlier Editions of Linnæus, and of the *Hortus Bengalensis*; the *Hingan* of the Hindus. De Sacy, in the notes on Abdullatif, (p. 17.) has proved that the *Persea* is the *Lebakh* of the Arabs; and Delille (*Flora Egyptiaca*, fig. 28.) has shown that it is a new genus.

* Pet-amen-oph, or Petemenon, (Ammonius,) was born 12 Tybi, (12 Jan.) A. D. 95, in the 15th year of Domitian, not in the 5th of Hadrian, as M. Champollion (Cailliand, iv. 51.) says. It may also be remarked that this Zodiac is evidently Astrological, as are all others hitherto discovered in Egypt, which all belong to the Roman period: Astrology, as Letronne has justly observed, (*Ecclaireissements*, p. 98.) was a Chaldaean Science, scarcely known among the Greeks before the beginning of our era: never much in vogue among them, but eagerly cultivated by the Romans so soon as they had any intercourse with the East.

† If the Egyptians subdivided their months into halves, these figures might represent the Year, and then this triple division would indicate the three Seasons; the green the first, red the second, and yellow the third, marked by a garden, a house, and water, in the hieroglyphic character. On other monuments the hours of night are represented as following a crocodile, the symbol of Darkness and the West. (Horapollo. i. 70. 89.)

MUMMY. Canary Islands have been already noticed in this Work, (xix. 231.) and it is a mistake to suppose that when removed from their coverings, they "fall to dust." Many have been brought into Europe, and every one who has seen the Library of Trinity College, Cambridge, will recollect the specimen which is preserved there, and is still entire. It is deserving of notice that the Guanches were an African race, a branch of the widely extended Berbers, who appear, from time immemorial, to have occupied both sides of Mount Atlas, and the Oases in the Great Desert. (Sahrá.) Their Language, moreover, has some points of resemblance to the Coptic, though it is not yet sufficiently known to admit of any positive judgment, as to further traces of affinity. The ancient Peruvians possessed a similar Art, and Garcilasso de la Vega* was allowed, before he left his Country in 1579, to see the bodies of his Royal ancestors, who were placed in a sitting posture with their hands crossed upon their breasts. Something of the kind has also been observed among the Abipones in another part of South America. The natives of Nukahiva, in the Marquesas, as we learn from M. Krusenstern, (i. 173.) harden, and thus preserve the bodies of their friends by continual friction with cocoa-nut oil during nine months; after which, the body is broken in pieces and deposited in a chest in the Moraï or burying place. A somewhat similar custom also was noticed by Captain Cook at Tahiti; and he mentions the extraction of the intestines, which seems to have been overlooked by the Russian circumnavigator. The mere desiccation of dead bodies, as is practised in some parts of Europe, cannot be considered as a branch of this Art, since it is owing to some peculiar local advantages rather than to any exertion of skill, and is very defective in one essential point, the prevention of distortion. The lead cellars (*Bleikellers*) at Bremen, crypts of the Cordeliers at Toulouse, vaults of the Abbey at Quedlinburg, and grottoes in the Convent of Capuchines near Palermo, are all celebrated for their antiseptic properties. Honey also is said to have been occasionally used by the Egyptians for the preservation of bodies, (Abdul latif, 148. 199.) and glass by the Æthiopians, (Herod. iii. 24. Diod. Sic. ii. 15.) rock crystal, or some fusible and transparent mineral, being probably the substance employed, unless the whole account be fabulous: it is likewise affirmed that in modern times, Kerkring preserved the body of an infant by enclosing it in amber.

Embalming
in the
Middle
Ages.

The practice of embalming the bodies of Princes and persons of distinction, was probably introduced, with Christianity, from the East, but could not have been established in the West before the downfall of Paganism. Its commencement, therefore, may be dated from the IVth century, while the Art was yet flourishing in Egypt; whence it was probably communicated to other Countries. Of the processes used in the Middle Ages little is known. A copious application of salt, ardent spirits, wine, and vinegar, or the immersion of the body in a balsamic solution, the air having been carefully excluded, are supposed to have been the methods most frequently adopted; but the bodies of those who died within the limits of that period (A. D. 300 to 1500) have seldom been found in any very high degree of preservation. The coffin of Edward IV., who died in 1483, when opened in 1789, contained nothing but a skeleton,

a little brown hair, and a small quantity of fluid arising, as appeared on analysis, from decomposition. Among the processes adopted within the last half century the following are most worthy of notice. William Hunter's (Crell, *Neue Entdeck.* x. 55.) consisted in, first, injecting into the inguinal arteries this mixture: oil of camomile, two parts; oil of lavender, eight parts; and oil of rosemary, sixteen parts; or pure oil of turpentine, coloured with a little cinnabar: it was injected with such force as to fill even the cellular membrane. After a short time, the intestines were carefully removed, cleansed, and dried, the arteries cleared of blood and the injected mixture, by a powerful friction of the body, preparatory to the infusion of an antiseptic mixture, consisting of oil of turpentine, six pounds; turpentine, five ounces; cinnabar, eleven ounces; camphor, two ounces; alcohol, three pounds. The muscular parts were next carefully washed with this mixture, and the vessels of the intestines filled with it; they were then replaced, and every cavity filled with a powder composed of yellow rosin or pitch, ten pounds; saltpetre, six pounds; and triturated camphor, five ounces. Some of the above mixture was then poured into the pectoral and abdominal cavities, the skin sewn up again, and all the orifices of the body, including the eyes, cleansed and filled with the powder as above; and lastly, spirit of camphor, and then oil of rosemary and lavender were well rubbed in over the whole surface of the body. Thus prepared it was laid in a coffin half-filled with roasted and pulverized gypsum, bits of camphor being scattered about, and open phials of ethereal oil placed round. The coffin was then well closed up. After a lapse of four years the gypsum was renewed; and again, if necessary, for the complete desiccation of the body. Boudet, who was commissioned to embalm the bodies of the French Senators, prepared 1st, a powder consisting of tan, deflagrated culinary salt, Peruvian bark, cinnamon, and other astringent and aromatic substances, asphaltus, benzoë, &c. The tan in the proportion of one-half and the salt of one-fourth of the whole weight. 2dly, alcohol saturated with camphor. 3dly, camphorated vinegar mixed with the above. 4thly, a varnish composed of balsam of Peru and Copaiba, liquid storax, oils of nutmeg, lavender, and thyme. 5thly, alcohol saturated with muriated mercury. When all these preparations were ready, an incision was made in the great cavity, and the intestines were removed, the head opened in the common manner for the extraction of the brain, the intestinal canal divided, deep incisions made in the bowels, and all washed, after having been well cleansed, with camphorated vinegar and camphorated spirit of wine, and then sprinkled with the powder No. 1. Deep incisions were next made in the outer surface of the great cavities and lengthways in all their muscles, which had been previously washed with camphorated vinegar and camphorated spirit of wine, and afterwards touched with a solution of corrosive sublimate. The cavities and incisions were then coated with the varnish No. 4, sprinkled with the powder, the intestines replaced, the cavities filled with the powder, and the integuments sewn up, those lying over bones being internally varnished and powdered. The whole outer surface having been varnished and sprinkled with powder, the body was swathed with cere-cloths, varnished, powdered, and laid in a leaden coffin, the cavities being all filled with the prepared powder, and the cover was then soldered down. M. G. H. Ritter proposes

Ritter's
method.

* Not the Spanish Poet of that name, but a native of Cuzco who wrote a *History of Peru and the Incas*.

MUMMY. (*Encyklopæd. v. Balsamiren*) to use a solution of arsenic, distilled water, and spirit of wine for the injection into the arterial system; and to cleanse carefully all the cavities of the body after the removal of their contents. The whole outer surface should be bathed with the same solution till the skin is quite dry. The body in the mean time should be frequently turned, and from the third to the eighth day constantly kept in a room heated to the temperature of 86° (Fahrenheit.) On the ninth every remnant of moisture should be removed from the cavities, and replaced by the following liquid balsam and aromatic powder. 1. Canadian turpentine, four pounds; balsam of Copaiba, half a pound; oil of cinnamon, eight ounces; oil of nutmegs, four ounces; spirit of wine, so much as is necessary to give the mixture a proper consistency. 2. Dried leaves of marjoram, thyme, and sage, two pounds each; Peruvian bark, one pound; ginger, cloves, and nutmegs, half a pound each; all to be reduced to a very fine powder. When the preparation is complete, the body should be sewn up tight in fine linen, the face covered with a linen mask, and the whole thickly laid over with the above balsamic varnish, before it is placed in the leaden coffin and soldered down. It is probable, however, that now a more simple, expeditious, and economical process might be devised by the use of pyrolignous acids or chlorurets of lime.

Mummies of birds, &c. For the Mummies of sacred animals, asphaltus seems to have been the principal ingredient used by the Egyptians. Arsenic, or arsenic and alum, pulverized and mixed with wood ashes, are the most convenient desiccatories for the skins of large animals, but, where bone or flesh remains, spirit of camphor and oil of turpentine must be first rubbed in. For the preservation of birds, Cuckham recommends a varnish of turpentine, oil of turpentine and camphor, and a dry application of musk and corrosive sublimate, one part each; saltpetre, alum, and purified sulphur, two parts each; black pepper and coarsely ground tobacco, four parts each. Chaptal recommends the injection of sulphuric ether through the beak with a syringe. Drapiez takes dry soap, made of kali and blubber, and moistens it with a solution of camphor and musk, in alcohol, and with this liniment,

MUMP, v. See MUMBLE. To speak, to eat, to MUMPS, } move the lips with the mouth nearly
Mu'MPER. } closed; consequentially, to beg.

Also the trivial name of a kind of quinsy, (*Cynanche*), from its swelling the chaps.

TER. The tailor will run mad upon my life for't.

PED. How he mumps and bridles; he will ne'r cut clothes again.
Beaumont and Fletcher. The Maid in the Mill, act iii. sc. 1.

I speak
Not out of passion neither (leave your mumping,)
I know you're well enough.

ELDER LO. Not such another as I was, *Mumps*; nor will not be.
Id. The Scornful Lady.

Where's Junius?

PETILL. In's cabin,
Sick o' th' mumps, sir.

Id. Bonduca, act i. sc. 2.

All other trades demand, verse-makers beg;
A dedication is a wooden leg;
And barren Labeo, the true mumper's fashion,
Exposes borrow'd brats to move compassion.

Young. The Love of Fame. Satire 4.

bathes all the skin when cleansed of fat, sprinkling pulverized soap between the feathers, and placing the bird in a moist place, after which it is dried a second time. Culinary salt dissolved in one-third of its weight of water has been found sufficient for the preservation of anatomical preparations, and spirit of wine has long been used for subjects of small bulk meant to be preserved entire; but great care must be taken to keep the vessels filled with it, air-tight; and the softness and colour of the preparations will be preserved by the addition of one-fifth part of dilute ammoniated alcohol.

MUNDIFICATION, } *ficare*; Sp. *mundificar*; Lat.
MUNDIFICATIVE, *adj.* } *mundare*, (from *mundus*.) to
MUNDIFICATIVE, *n.* } cleanse.
To cleanse, to purify.

The leaves of the wild olive reduced into a cataplasme, serveth well to cleanse and *mundifie* where need is.

Holland. Plinie, book xxiii. ch. iv.

And so doth fire cleanse and purifie bodies, because it consumes the sulphureous parts, which before did make them foul: and therefore refines those bodies which will never be *mundified* by water.

Sir Thomas Brown. Vulgar Errours, book vi. ch. xii.

The juice both of the braunches and hearbe itself as also of the root, is singular for to scour the jaundice, and all things els which have need of clensing and *mundification*.

Holland. Plinie, book xxiv. ch. vi.

The powder of this stone [the calamine] is commended principally in medicines for the eyes, for a gentle *mundificative* it is, and cleanseth the ulcers and sores incident unto them.

Id. Ib. book xxxvi. ch. xxi.

Stale butyr that hath been long kept, is mingled in many compositions: for by nature it is astringent, emollient, incarnative, and *mundificative*.

Id. Ib. book xxviii. ch. ix.

MUNICH, in German *München*, the Capital of the Kingdom of Bavaria, is situated on the left bank of the Isar, in a plain enclosed to the East by a range of low hills. In consequence of its elevation, amounting to 1920 feet above the level of the sea, and the vicinity of the Tyrolese Alps, the temperature is low in proportion to the latitude and the weather often harsh, variable, and unfavourable to health. It is a well-built city, having, in addition to many handsome streets, several fine Squares. Abundance of water is supplied by canals and conduits from the Isar; and the streets are paved, provided with *trottoirs*, and well lighted. The greatest ornament of the city is the Royal Palace, 540 feet long and 280 broad, of the Doric order, built externally in a lofty and magnificent style, and internally finished with much elegance and splendour. The King's Cabinet of miniatures is rich, and the Maximilian Gallery is among the most celebrated in Europe. Of the twenty-two Churches of Munich the most worthy of notice is that of Our Lady, which contains thirty altars,

a number of valuable pictures, and a curious monument of the Emperor Lewis the Bavarian. It has two turrets 330 feet high, from the top of which the view is extensive and beautiful. There are two public Theatres in Munich. The Royal Academy was founded and munificently endowed in 1757 by the Elector Maximilian Joseph III. Under its management is placed the Royal Library, containing 8500 MSS. and 400,000 volumes, among which are many of the earliest specimens of Printing. Besides this are the following Institutions devoted to Art or Science. A Royal Museum of Painting, a Cabinet of Medals, a Museum of Natural History, a Botanic Garden, an Observatory, and Schools of Chemistry and Anatomy. In 1826, the University was removed from Landshut to Munich; in addition to which there is a Central School of Polytechny and a Royal Institute of Instruction, containing the Schools, 1st, of Philology, 2dly, of Medicine, 3dly, of Veterinary Science, 4thly, an establishment for the gratuitous instruction of poor students from all parts of Bavaria. The charitable Institutions of Munich are still more praiseworthy than the scientific. The Hospital has accommodations for 700 patients, besides 60 chambers for the use of those whose easier circumstances permit them to remunerate the charity. At an establishment founded in pursuance of the suggestion of Count Rumford, provisions are daily distributed to above 600 paupers, and such as wish to avoid publicity in their solicitations, are allowed to carry off their portion from a wicket unobserved by any eye. Such liberality might be expected to encourage mendicity, but checks so judicious and effectual are applied, that perhaps no city suffers less from this evil. Culpable vagrants are immediately apprehended and placed in a well-managed House of Industry; and the destitute children of both sexes are taken charge of by proper persons, and maintained and educated at the public expense. There is little either of commerce or manufactures in Munich, and such of the inhabitants as have no independent income, derive their support from the revenue expended by the Court and the wealthy residents. It is a Bishop's See. Population, in 1825, 75,000. Latitude 48° 7' North, longitude 11° 35' East.

München, Von Müller, Mainz, 1816, 1817, 2 vols. 8vo.; Huber, *München im Jahr* 1819.

MUNICIPAL, } Fr. *municipal*; It. *municipale*;
MUNICIPALITY, } Sp. *municipal*; Lat. *municipalis*;
Municipes, a munere capiendo, sic appellantur, and were thus, *muneris cum populo Romano honorarii participes. Municipalis lex, quæ propria est cujusque municipii*. See Vossius. *Municipal*, as now used, is

Of or pertaining to a town or township; to a district of a certain number of towns; and (as by Blackstone extended) to one whole State or Nation.

The greatest part of this booke is bestowed in the description of the colleges and collegiate houses founded in this citty, for the professors of the *municipall* or common law of this land.

Stow. Works, fol. 961. *Geo. Buck to Sir Edward Coke*.

Episcopacy is and hath long been settled in this kingdom, and (as it were) incorporated into it, and enwoven into the *municipall* laws of this land.

Hall. Works, vol. iii. fol. 544. *The Modest Offer*, &c.

Municipal law is also "a rule of Civil conduct." This distinguishes *municipall* law from the natural, or revealed; the former of which is the rule of moral conduct, and the latter not only the rule of moral conduct, but also the rule of faith.

Blackstone. Commentaries. Introduction, sec. 2.

MUNICH.
—
MUNICI-
PAL.

MUNICI PAL. We provide first for the poor, and with a parental solicitude, we have not relegated religion (like something we were ashamed to shew) to obscure *municipalities* or rustick villages.

 MUNITE. *Burke. Works*, vol. v. p. 195. *Reflections on the Revolution in France*.

MUNI'FICENCE, } Fr. *munificence*; It. *munifi-*
 MUNI'FICENT. } *cenza*; Sp. *munificencia*; Lat. *munificentia*; applied to libe-
 MUNI'FICENTLY, } rality or largess, in *munis fa-*
 MUNI'FIC. } *ciendis*, i. e. in exhibiting the usual public Games to the
 people; and then generally to
 Liberality, generosity, bountifulness.

By *munificence*, Spenser means *defence* or *fortifica-*
tion, from *munio*, and *facio*: and Warton justly calls
 it an injudiciously coined word.

This land invaded with like violence,
 And did themselves through all the North display:
 Untill that Locrine for his realmes defence,
 Did head against them make and strong *munificence*.
Spenser. Faerie Queene, book ii. can. 10.

That God doth graciously accept, and *munificently* recompence
 our good works even with an incomprehensible glory, wee doubt
 not.

Hall. Works, vol. ii fol. 12. *The Old Religion*, ch. v. sec. 2.

Who [King Edward the Sixth] is not to be mentioned, without
 particular honour, in this house, which acknowledges him for her
 pious and *munificent* founder.

Atterbury. Sermon 2, vol. i. p. 79.

But our princely guest
 Must though impatient, for a time defer
 His voyage, that with due *munificence*
 Our gifts may be prepar'd.

Fenton. Homer Imitated.

To thee, *munific* ever-flaming Love!
 One endless hymn united nature sings.

Blacklock. Hymn to Divine Love.

From a thorough conviction of this truth, our *munificent* bene-
 factor Mr. Viner, having employed above half a century in amassing
 materials for new modelling and rendering more commodious the
 rude study of the laws of the land, consigned both the plan and
 execution of these his public-spirited designs to the wisdom of his
 parent university.

Blackstone. Commentaries. Introduction, sec. 1. p. 27.

The institution of a school of statuary in the house of a young
 nobleman [the Duke of Richmond] of the first rank rivals the
 boasted *munificence* of foreign princes.

Walpole. Anecdotes of Painting, vol. i. *Preface*, p. xii.

MUNITE, } Fr. *munir*, *munition*; It. *munire*,
 MUNITION, } *munizione*; Sp. *municion*; Lat. *mu-*
 MUNITING, n. } *nitio*, from *munire*, to enwall, or sur-
 MUNITY, } round with walls, (*muris*), to defend,
 MUNIMENT. } to fortify.

To defend, to fortify, to strengthen, to secure.

Muniments; securities, writings, evidences, records,
 as securities for right or title.

The distroyer is come before thy face keep thy *munition*, loke to
 the way, make (thy) loynes strong: increase (thy) strength
 mightily. *Geneva Bible*, 1561. *Nahum*, ch. ii. ver. 1.

By protractyng of tyme and longe space Kyng Henry might
 fortifie & *munite* all daungerous places and passages w^t souldiours
 & men of warre. *Hall. Henry VII. The eleventh Yere*.

The archbishop answered that hee tooke nothing in hand against
 the king's peace, and he was in armour, & *munited* with men only
 for feare of the king whome hee coulde not safely come vnto to
 speake. *Stow. Henry IV. Anno 1405*.

Upon a day, as she him sate beside,

By chance he certain *muniments* forth drew,

Which yet with him as relickes did abide,

Of all the bounty which Belphebe threw

On him, whilst goodly grace she did him shew.

Spenser. Faerie Queene, book iv. can. 8.

Men must be ware, that in the procuring or *munition* of religious
 unity they do not dissolve and deface the lawes of charity and of
 humane society. *Bacon. Essay 3*, p. 16.

MUN-
STER.

To those I may answer, that I have put up these colours in deed,
 that those vessels I would speak with, might not fly from piety at
 first sight, as from an enemy to pleasure, that speaking with them,
 I might shew them how devotion coming and possessing our minds,
 doth rather compose the *munition*, then infringe the true liberty of
 our affections.

Mountague. Devoute Essayes, Treat. 4, part i. sec. 2. p. 35.

This action of our death especially
 Shows all a man. Here only he is found.
 With what *munition* he did fortify
 His heart.

Daniel. A Funeral Poem upon the Death of the Earl of Devonshire.

I [do] confess a Beaumont's book to be
 The bound and frontier of our Poetry:
 And doth deserve all *muniments* of praise,
 That art, or engine, or the strength can raise.

Jonson. On the Poems of Sir John Beaumont.

The inward firmness of one must be corroborated by the exterior
munitions of the other. *South. Sermons*, vol. vii. p. 75.

The defenced city shall be desolate: no defence or *munition* can
 keep out a judgment, when commissioned by God to enter.

Id. lb. vol. viii. p. 110.

MUNNOZIA, in *Botany*, a genus of the class *Syn-*
genesia, order *Superflua*. Generic character: calyx
 bell-shaped, tiled with narrow, three-cleft scales; down
 pilose; seeds truncated, striated.

Four species, natives of Peru.

MUNSTER, a possession of the Prussian Monarchy,
 and one of the three Circles of Westphalia, is bounded
 on the North-West by the Kingdom of the Netherlands,
 North-East by Hanover, East by the Circle of Minden,
 South by that of Aensberg, South-West by Cleves.
 The superficial extent is 2688 square British miles,
 maintaining a population of 353,283 individuals, of
 whom 319,026 are Roman Catholics, 31,958 Protes-
 tants, and 2304 Jews. It is divided into the following
 districts:—

	Population.	Chief Towns.	Population.	Lat. N.	Long. E.
Munster.....	46,867	Munster.....	18,218	51° 58'	7° 32'
Ludinghausen..	28,900	Ludinghausen..	1,324	51 46	7 26
Recklinhausen..	36,332	Recklinhausen..	2,223	51 37	7 10
Kosfeld.....	34,989	Kosfeld.....	5,455	51 57	7 9
Borken.....	34,467	Borken.....	2,083	51 50	9 50
Ahaus.....	33,470	Ahaus.....	1,103	52 4	9 16
Steinfurt.....	34,402	Steinfurt.....	1,856	52 9	7 20
Teklenburgh..	33,076	Teklenburgh..	901	52 31	
Warendorf....	29,496	Warendorf....	3,958	51 57	
Beckum.....	28,492	Beckum.....	1,943	51 45	

The Circle of Munster is remarkably level, containing
 extensive sandy tracts, which are, however, judiciously
 employed in the culture of such crops as do not require
 great fertility of soil. Turnips and similar green crops
 for the food of cattle are extensively grown; still a con-
 siderable proportion of the ground is rich, and there
 both corn and flax are largely produced. The latter is
 one of the staple articles of the Country, as the object
 both of agricultural and manufacturing industry, afford-
 ing support to above 10,000 weavers. There are no
 forests but many small woods in Munster; the fuel
 however consists principally of peat and coal, of which
 there are productive beds worked to a considerable
 extent. The rivers are the Lippe, Ems, Emster, Werre,
 Berkel, and Aa. The places of importance, in addi-
 tion to the chief towns already mentioned, are, in the
 district of Munster, *Graven*, population 3434; *Notteln*,
 population 2906; in the district of Ludinghausen,
Senden, population 2016; in the district of Reckling-

MUN-
STER.
—
MU-
RÆNA.

hausen, *Boer*, population 4506; in the district of Kosfeld, *Dulmen*, population 2013; in the district of Steinfurt, *Rheina*, population 2254.

MUNSTER, the chief town of the district and circle of the same name, as well as of the Province of Westphalia, is situated on the Aa. The ramparts form a delightful promenade, being through their whole circuit ornamented with four rows of luxuriant trees. The Archiepiscopal Palace, built on the former site of the citadel, is a handsome edifice surrounded by beautiful gardens. There are ten churches besides the cathedral; in that of St. Lambert may be seen the three cages in which the bodies of those notorious fanatics, John of Leyden, Knipperdoling, and Krechting were exposed. The Council-house is adorned by a handsome Gothic façade, and its principal apartment is kept in the state in which it appeared in 1648, when the assembled envoys signed the celebrated Treaty of Westphalia, by which Religious toleration was established in Germany. The town is well built with broad and regular streets: it has a University attended by 400 students, under the instruction of a Director and ten Professors. This Institution is provided with a Library of 25,000 volumes, a Botanic Garden, and a Collection for the study of the Fine Arts. Munster was formerly a place of more importance than at present, having been an influential member of the Hanseatic League. At the time of the Reformation it was noted as the focus of the outrageous and fanatic spirit of innovation which, under the influence of the Anabaptists, threatening Society with ruin, created apprehensions unfavourable to the cause of Religious improvement. After this ebullition, the People attempted to render Munster a free town, but their warlike Prelate, John of Gallen, in whom the sovereignty vested, reduced them to obedience. The majority of the townsmen is at present Roman Catholic; but the number of those who profess Protestantism is increasing, as well from the influx of people professing that Faith, as from its influence in consequence of being the Religion of the ruling power. Munster is advancing in population and wealth, deriving great commercial advantages from the Ems having lately been made navigable, and connected both with the town and the river Lippe by two well-projected canals. Mallinkrodt, *Geschichte Geologie und Statistik von Westphalen*, Dortmund, 8vo. 1816; *Beyträge zur Geschichte und Verfassung des Herzogthums Westphalen*. Damst. 8vo. 1803.

MUNTINGIA, in *Botany*, a genus of the class *Polyandria*, order *Monogynia*, natural order *Tiliaceæ*. Generic character: calyx five-parted; corolla, petals five; berry five-celled.

One species, *M. calabura*, native of Jamaica.

MURÆNA, from the Greek *μύραινα*, Lin. Bloch; *Eel*, Pen. In *Zoology*, a genus of animals belonging to the family *Anguilliformes*, order *Malacopterygii Apodes*, class *Pisces*.

Generic character. Body snake-like, furnished with pectoral fins, underneath which are the narrow lateral branchial apertures.

The fishes belonging to this genus are distinguished from the *Gymnothoraces* in having pectoral fins, which however are small, and their branchial apertures being of greater size. Among themselves there is some variation as to the extent of the dorsal and anal fins, but hardly sufficient to divide them into distinct genera.

a. *Anguilla*, Thunberg. *True Eels*.

Have the dorsal and anal fins elongated beyond the tail, so as to form a pointed caudal fin; and some of

them have the dorsal fin commencing far behind the pectorals, with the upper jaw very short; such are

M. Anguilla, Lin.; *l'Anguille Vulgaire*, Lacep.; *Common Eel*, Shaw. The back dusky green, the belly whitish, inclining to yellowish or brownish, according to the water in which they live; sometimes they are speckled with deep brown. They are found only in fresh water, but indifferently in streams or ponds; feed by night upon the spawn of fishes, insects, &c.

According to Cuvier the *Lepidopus Diaphanus* of Risso is an Eel, and belongs to this division.

With the same disposition of the dorsal fin some have the upper jaw longest; as the

M. Longicollis, Cuv.; *M. Myrus*, Lacep.; *Long-necked Eel*.

Some of the Eels have the dorsal fin arising either close to the pectoral fins or immediately with them, and the upper jaw always the longer. Of these are the

M. Conger, Lin.; *le Congre Commun*; *Conger Eel*, Pen. Occasionally attains the length of eight or nine feet, and the thickness of a man's leg, and weighs a hundred pounds; its back dusky, the belly whitish, the lateral line consisting of numerous white dots; the dorsal and anal fins edged with black. It is found throughout the European seas; its flesh is very coarse, and little esteemed.

M. Myrus, Lin.; *le Myre*; *Rondeletian Eel*, Shaw. Is very similar in its form to the Conger Eel, but much smaller, and distinguished by some small spots on the nose, a streak across the occiput, and two rows of dots along the nape of a white colour; the dorsal and anal fins white with a black edge. Found in the Mediterranean, as are also the following, described by Laroche and Risso.

M. Balearica vel Cassini.

M. Mystax.

M. Nigra.

M. Strongylodon, Schneid.

β. *Ophisuri*, Lacep. *Snake Eels*.

In this division the dorsal and anal fins do not reach quite to the end of the tail, which remains pointed and finless; in some the pectoral fins are of the ordinary size, and the teeth pointed; such are

M. Serpens, Lin.; *le Serpent de Mer*, Salv.; *Snake Eel*, Shaw. About five or six feet long, and as thick as a man's arm, with a slender, pointed muzzle; brown above, silvery beneath; the lateral line dotted. Found in the Mediterranean.

M. Ophis, Bl.; *Spotted Eel*, Shaw; and the *Ophisurus Punctatus* of Cuvier, from Surinam, belong to this division.

In some of this division the teeth are obtuse, and the pectoral fins are so small as almost to escape observation, and thus lead from the *Murænæ* to the *Gymnothoraces*; such are the

M. Colubrina, Boddaert; *M. Annulata*, Thunberg; *Murenophis Colubrinus*, Lacep.

M. Fasciata, Thunb.

M. Maculosa, Cuv.; *Ophisurus Ophis*, Lacep.

MURCIA.

Extent and boundaries.

Mountains.

Rivers.

Segura.

Sangonera.

Aspect of the country.

MURCIA, a Province of Spain, in the State documents of which Country it is styled "the Kingdom of Murcia." It lies between $37^{\circ} 10'$ and $39^{\circ} 10'$ latitude, and between $50'$ and $3^{\circ} 5'$ West longitude, is 110 miles in length, the same extent in breadth, and has an area of 7770 square British miles. It is bounded on the North-West by La Mancha, North by Cuenca, East by Valencia, South-East and South by the Mediterranean Sea, West by Granada. Much of the country is mountainous. The Spanish Geologists have divided the mountains of the Peninsula into seven groups, or systems, as they style them. Of these the Iberian Range, stretching from Biscay in a South-East direction, the Marianian Range, or the *Sierra Morena*, running nearly under the 38th parallel of latitude, and the Bætic Range, or *Sierra Nevada*, lying more to the South, and almost parallel to this last, as well as to the coast of the Mediterranean, all join in Murcia. The elevation of this uniting group, which bears the name of the *Sierra de Segura*, is in general moderate, though some summits about the town of Segura are covered with snow throughout the year: the Pico de Peñalosa is ascertained to have an altitude of about 2300 feet. In the North-Western part of the Province is the ridge which in this part of the Peninsula divides the waters flowing to the Atlantic from those received by the Mediterranean; as the Guadalimar, a tributary of the Guadalquivir, falls down the Western side, while the Segura proceeds Eastward. The Xucar, a considerable river flowing Eastward for some distance, forms the Northern boundary of Murcia. The Segura, however, is the only river that can be considered to belong to the Province, which it completely traverses from West to East, accompanied by fertility and picturesque beauty in all parts of its course. It rises amidst rocky mountains near the town of Segura; and after receiving the tributary waters of the Mundo Taibilla and Moratalla, passes into the Kingdom of Valencia, where it falls into the Mediterranean, having completed a course of 170 miles. It is not navigable, unless that term can be applied to it in consequence of timber being floated down it during floods; but the productiveness of the Huerta of Murcia, a tract extending along the course of the Segura, and every where exhibiting a luxuriant growth of the most valuable objects of cultivation, results from the irrigation afforded by this river. The Sangonera is a stream also rising in the West, and flowing Eastward. Part of its water is conveyed to the sea by means of a canal passing to Carthagena, but most of it, dispersed over the country in innumerable water cuts, is lost by absorption or evaporation; a small quantity is conveyed by these canals to the Segura, but the Sangonera itself has no natural channel to the sea. Besides these there are no streams of a size greater than brooks; and much of the country is, from want of water, a waste as dreary and barren as the deserts of Africa. Of this nature is part of table-land, or *Paramera*, stretching between Carthagena and Granada. In such parts the cactus is in general the sole vegetable production, though the scene is sometimes enlivened by copses of cistus, rosemary, lavender, and similar aromatic shrubs. A tract of the same nature, under the name of *El Campo*, extends from the City of Murcia to the coast. It is enclosed to the North and East by a low range of calcareous mountains, consisting generally of alabaster, or limestone, formed of petrified *echini* and bivalve shells

dissimilar from those at present to be found in the contiguous sea. In the Northern part of the Province there is an extensive plain, the continuation of the table-land of Castille. Lakes are as rare as in other parts of Spain. A salt lake is situated near Villena; and some shallow pieces of water rendered the neighbourhood of Albacete very unhealthy, until drained by means of a canal, which, about eight miles long, thirty feet wide, and seven feet and a half deep, conveys the superfluous waters into the Xucar; and besides salubrity, confers fertility on the country from the aid which it affords to irrigation. On the coast a shallow inlet, the Mar Menor, or Encansada of Murcia, extends about three miles in breadth and ten in length, separated from the sea by a narrow spit of sand, like those which enclose the *Hafs* of the Southern shore of the Baltic, and the *Lagunes* of North America. A narrow strait gives admittance to small vessels, which find good anchorage here, and shelter from the waves.

The sea-shore is low and sandy from the Eastern extremity to Carthagena, where it assumes a bolder character. The haven of Carthagena is the best in Murcia, and indeed in Spain. The celebrated Doria used to say that he knew but of three good ports—June, July, and Carthagena. It is very large and deep, and land-locked on the East and West by two ranges of hills, and on the North by the eminence on which the town is built. The Island of Escombrera, (the *Scombraria* of the Ancients,) lies before the entrance, and breaks the violence of the waves. In the entrance a ridge of sunken rocks causes risk to navigators not acquainted with the coast. Forts on the headlands at each side command the passage, though not with complete effect in consequence of the breadth, which is about a mile. The coast Westward to the confines of Granada consists for the most part of cliffs rising precipitously from the sea, and scarcely admitting a landing except at the port of Aquilas. From what has been stated it results that there are three ports in the extent of coast amounting to eighty miles. Cape Palos, though a striking object from its projecting far into the Mediterranean, is not of great elevation.

The principal mineral productions are lead, alum, sulphur, and a few precious stones. The Romans formerly wrought silver mines near Carthagena, and very extensive excavations evidence the activity of their operations, but the superior productiveness of the American mines at present prevents such employment of labour and capital. In the neighbourhood of Almazaren is found a soft, fine, unctuous, red clay used for polishing mirrors, and employed to mix with tobacco for the purpose of diminishing its volatility, and giving it that softness and moisture which makes the Spanish mixture so favourite an article with those addicted to the use of snuff. The surface of the mountains is in many places a mere calcareous rock, incapable of culture from a deficiency of vegetable mould; and as the extent of such tracts is considerable from this cause, as well as from the want of water on the table-lands and the coast, two-thirds of the lands are totally unproductive. Where there is water, however, the soil is one of the most productive in the world. There are natural hot baths at Archena and at Monbuy, and in various parts of the Province springs impregnated with sea-salt, and some containing such other mineral admixture as renders them serviceable in the medical treatment of diseases.

MURCIA.

Sea-coast.

Mineralogy.

MURCIA. The heat in Summer is very great, and, when the Solano or South wind blows, nearly insupportable. During the prevalence of this wind, which corresponds with the Sirocco of Italy, and comes loaded with noxious gases, and totally deprived of moisture by its passage over the African desert, the Sun is dimmed, and the atmosphere presents the appearance of a dull, blue haze. The air is hot like the blast of a furnace, and scorches the vegetable productions, whilst the fish lie gasping on the warm surface of the water. The land animals suffer exhaustion, sometimes so great as to produce death; in the human race the intellectual faculties often become temporarily deranged, and many individuals are attacked by swooning or vertigo. Such at the same time is the nervous excitement which it produces, that its duration is invariably attended by an increase of debauchery and crime. At other times during the Summer months, the heat, though very great, is not prejudicial to health or longevity, though it greatly accelerates the period of puberty, insomuch that it is not uncommon that girls should become mothers at twelve or thirteen years of age; and, as is the usual result of such premature development, their personal attractions early fade away. On the coast, intermittents and other febrile diseases sometimes prevail; and the yellow fever, introduced from America, has occasionally made frightful ravages. Rain falls very seldom in the low grounds; ice and snow is almost unknown, and the Winter is described as a delightful season, healthful, and of moderate temperature, while the country is adorned by fresh verdure and orange groves in full bearing.

Natural productions. The wild quadrupeds of Murcia are few; principally wolves, foxes, wild swine, and a few small species of the genera *Felis* and *Mustela*. The productions of the vegetable kingdom, however, are varied and important, supplying some of the most valuable articles of commerce. Palms are extensively planted; and in the season of gathering the crop, the trees, laden with gold-coloured bunches of dates, exhibit an amusing picture, as the peasants are suspended by means of ropes from the boughs for the purpose of reaching the fruit. It is a common practice to wrap boughs of this tree in matting, until, by the exclusion of light, the leaves become completely blanched, when the branches are cut for the purpose of exportation to Italy, where they are in demand for decorations on Palm Sunday. The alkalescent salts, which, under the names of soda and barilla, this Country supplies to commerce, are obtained principally from two plants, glasswort (*Salicornia*) and barilla. (*Salsola sativa*.)

Barilla. Barilla affords the most valuable salt for bleaching, as the others are too acrid, and contain a large proportion of muriate of soda; its cultivation, however, is troublesome and expensive, as the ground must be well manured, and subsequently allowed to lie fallow for a year before the plant be sowed. It grows to the height of about four inches, and spreads out into a number of sprigs resembling samphire. The colour is a dark green, turning slightly brown when the crop is fit for cutting. The ashes are obtained by piling the plants several feet above a shallow pit and burning them, when the residuum falls down in a liquid mass red hot; and after some days, during which it is left to cool, is sent to market. The less valuable kinds are generally much more productive; and one species, the Gazul, requires little labour, and neither irrigation nor manure. **Esparto.** the *spartum* of the Ancients, (*Stipa tenacissima*.) a sort of tough rush, is produced in abundance about Carthagena. Of forty-

five purposes to which, according to the Spanish writers, it is applied, the most important and extensive is the making of cables, which are cheaper and more durable than those of hemp, and have the valuable quality of floating on the water. In the North-Western part of the Province are extensive woods of pine, oak, and other valuable timber, the remains of the great forest, which, so late as the last century, covered that quarter. About the middle of the XVIIIth century a Commission, appointed by the Crown to preserve the timber for the service of the Royal Navy, ascertained that there were then 458,000,000 trees; but in consequence of the neglect of those appointed to protect them from devastation, the number has sunk to about 44,000,000. The mulberry thrives remarkably well; and there are above 350,000 of those trees, which supply food for so great a number of silkworms, that 40,000 ounces weight of eggs are yearly produced.

Swinburne observes, that he has never seen elsewhere a plain exhibiting so luxuriant and beautiful vegetation as the Huerta of Murcia, or valley through which the Segura flows. Innumerable water-courses and tanks, the production of Moorish industry, dispense and preserve this invaluable agent in agriculture; and such is the advantageous result from its employment, that where there is an unlimited supply of water, wheat will produce the amazing return of a hundred-fold. As the attention of the cultivator is much directed to the production of oil, fruit, silk, and barilla, not more than 160,000 quarters of wheat are annually produced, and the quantity requisite for the consumption of the inhabitants is supplied by the importation of 300,000 quarters. The staple produce is silk, of which 250,000 pounds are reeled every year, and nearly the whole sent away in a raw state. Maize and barley are cultivated to a considerable extent; and the carob, (*Ceratonia*), or St. John's bread, an esculent produced in pods borne on a tree, is used as food both for cattle and for the labouring people. Its taste is slightly sweet but rather insipid, and its nutritive powers are but moderate. Wine of excellent quality, and in considerable quantity, is made, especially in the Northern part. There is a great profusion of all the fruits suited to the warmer part of the temperate zone, and the quality is almost unequalled; so that, besides affording an important and delicious ingredient in the diet of the inhabitants, they constitute a great article of export. The principal are grapes exported both in their natural state and prepared as raisins, olives, oranges, lemons, citrons, Seville oranges, pomegranates, figs, almonds, hazel-nuts, pistachio-nuts, chestnuts, capers, sweet acorns. Pulse is produced in great quantities, and forms a large proportion of the diet of the inhabitants, in addition to melons, gourds of various sorts, and onions.

Hassel states the value of the most important produce as follows:—

	Florins.
Corn	7,926,750
Olive oil	540,000
Wine	600,000
Alkaline salts	93,750
Saffron	84,375
Silk	2,343,750
	11,588,625
or, taking the florin at 2s.	£1,158,862

MURCIA.

Woods.

Huerta of Murcia.

Irrigation.

Amount of agricultural produce.

MURCIA. About one-sixth of the lands belongs to Ecclesiastics. Grazing is not much attended to. The principal live stock is sheep and goats. Like the rest of the Spaniards the people of Murcia are very fond of swine's flesh, and have a proverb, "No good dish without bacon, no good sermon without St. Augustin." Yet from some mismanagement the number of hogs is not very great. Miñano states the farming stock as follows: Oxen 22,240, horses 6314, mules 22,710, sheep 368,338, goats 282,874, asses 48,361, hogs 37,766, stocks of bees 39,060. Some cochineal is produced, and the sugar-cane is cultivated rather as a variety in diet when used fresh, than for the production of sugar. Cork and nutgalls are supplied in large quantities from the woods. The salt-works produce annually 42,000 bushels of that indispensable article.

Political organization and divisions.

Murcia, in military affairs, forms part of the *Capitaneria* of Valencia, in Civil matters it is subject to the jurisdiction of the Chancery of Granada. It is a Diocese the Bishop of which, bearing the title of Carthage and Murcia, is suffragan of Toledo; his income is estimated at about £5000 per annum. There are 101 Parish Churches, 91 Religious Houses, besides 14 Eleemosynary Establishments. The number of the regular Clergy is 3002, of the secular 1571. The population of the Province 455,400, inhabiting 102,971 houses; there are, consequently, 55 persons to each square British mile. It is divided into nine *Partidos* bearing the names of their chief towns, which are respectively:

	Population.
Albacete	11,874
Cartagena	13,000
Chinchilla	13,598
Cieza	6,856
Hellin	8,229
Lorca	40,366
Murcia	35,390
Segura della Sierra	3,998
Villena	9,563

Almanza and *Carthage* have been separately noticed.

Lorca.

Lorca, the *Eliocroca* of the Romans, is the largest, most populous, and probably the richest place in the Province. It contains a Collegiate and seven other Churches, seven Convents for men, and two for women, a Royal College, and a Citadel in a commanding position. It cannot boast of architectural beauty, as its streets are narrow and ill built. It is seated on the banks of the Sangonera, a shallow and scanty stream, but invaluable for the means of irrigation and consequent fertility which it affords. In the close of the XVIIIth century a vast work was projected for conveying into the Sangonera the waters which flow into the upper part of the Guadalentin: but after some progress had been made in its execution, the difficulties which presented themselves were so great as to cause the undertaking to be relinquished. In 1802 a dreadful calamity visited the town. Some projectors had collected into an extensive reservoir the torrents descending from the surrounding hills, and hoped to derive a great profit from the assistance which the collected water would give to irrigation in time of drought. The pressure unfortunately was too great for the wall of the reservoir, and it consequently gave way, so that the town was inundated, many houses and much property destroyed, and above six hundred people drowned. The

pecuniary loss on this occasion was estimated at above £600,000. During the time when the piratical powers of Barbary were formidable, this part of Spain suffered much from their ravages, and Colmenar in his account of Lorca mentions a singular circumstance which occurred in one of their incursions. A body of Algerine Corsairs having penetrated into the Country surprised and drove off a herd of horses, having made the keeper prisoner. He being allowed to ride, selected a mare, and when mounted, instantly set off at full speed followed by all the horses of the herd, each bearing an Algerine, who, not being provided with bridles, and not having courage to throw themselves off, were borne headlong into the midst of the town of Lorca where they were made prisoners. The arms of Lorca have the following motto in Leonine verse:

*Lorca solum gratum castrum super astra locatum,
Ense minans pravis, regni tutissima clavis.*

It lies in 37° 41' North latitude, 1° 36' West longitude.

Murcia, the Capital of the Province, is seated on the Segura, which divides it into two unequal parts connected by a handsome bridge. The embankment constructed to restrain the inundations of the river is about twelve feet broad, fourteen high, and one-third of a mile in length, and forms a delightful promenade. There are some other walks tastefully laid out, and in consequence of the luxuriant fertility and exquisite beauty of the neighbourhood, the views from them are of uncommon variety, richness, and picturesque effect. The town is large, and well built in a handsome style, with wide streets well paved and lighted. It contains a Cathedral and ten other Churches, twelve Convents for men, nine for women, five Colleges, and the Palace of the Bishop. The Cathedral is large and in a massive style, with handsome portals of red marble in the Corinthian order. It has, externally, a singular decoration, a huge chain wrought in stone extending round the building. The steeple is lofty, and has on the outside an ascent so gradual and broad that the top may be reached on horseback, or in a wheel-carriage. Thirty-two Statues with a profusion of well-executed arabesque ornament various parts of the building. On the walls are suspended the banners of such Jews as have from time to time been burned here by the sentence of the Inquisition. Murcia lies in 38° North latitude, 1° 11' West longitude.

The people of Murcia, according to Miñano, are tall, well made, and with handsome features. They are considered to possess talents for war and literature, and remarkable for a kind disposition. He doubts the justice of the charge of apathy and indolence often made against them, and observes, that they are active and persevering where encouraged by a prospect of *dulce lucellum*; and that, throughout the most inclement nights, they will continue abroad regulating the irrigation of their fields. The voice of travellers, however, is unanimous against the people of Murcia on these points, and the fact that almost the whole of the rich exports of the Country are sent out in a raw state, is unquestionable evidence of the small extent of manufacturing industry. Colmenar and Peyron give striking accounts of the rough manners and customs of the people, especially in the tract about Lorca. The inns, (*posadas*), generally kept by Gypsies, afford accommodation far inferior to that which the hostels of Britain are represented in contemporary records to have yielded five hundred years ago. The first apartment which the traveller

MURCIA.

MURCIA. enters is a stable filled with asses and mules, among which he must make his way to the kitchen, a large square room usually with a pyramidal roof open at the point to allow exit for the smoke. A range of stone benches along the walls serve, during the day, as seats for the muleteers, who usually crowd these places, and at night are occupied as bedsteads by the innkeeper's family as well as his guests. In the middle of the room is the fire fed with straw, wood, and dried cow-dung, and the cookery is confined to frying every sort of food in a profusion of bad oil. Those who wish for more retirement must content themselves with a close, dingy cell styled a chamber, and if furnished at all, having no other accommodation than a wretched mattress, and a scanty and dirty coverlet. By an unaccountable regulation of police there is a positive prohibition against the supply of provisions at the inns, so that the traveller must bring all with him. Murcia is assessed to contribute to the Royal Treasury the sum of 3,581,250 reals, or £42,646.

Historic
outline.

Murcia can scarcely be considered to have a distinctive History. Its possession was long and obstinately contested by the Romans and Carthaginians. In the II^d Punic War it was the scene of the sanguinary campaigns which terminated in the slaughter of the Roman armies, and the death of the brothers Cneius and Publius Scipio. Africanus, the son of Publius, subsequently avenged the death of the unfortunate commanders by totally defeating the Carthaginians, whom he drove out of the Country, placing it permanently under the dominion of the Romans. It remained an unmolested Province of the Roman Empire, until the

fall of that colossal structure, when it was first overrun by the Alani, who, in the VIIth century, were expelled by the Gothic King Suinthila. On the Moorish invasion its Governor, Theodemir, made an advantageous capitulation, and the new possessors, in admiration of his valour and conduct, styled the Country Tedmir, a name which it retained so long as their dominion lasted. Some, however, suppose that the appellation Tedmir was given from the palms abounding in Murcia, as in Arabic the word signifies that tree. It was wrested from the Moors in the beginning of the XIVth century by James II. King of Arragon, and from him passed by cession to the Crown of Castille. It then merged permanently in the Spanish Monarchy. During the Moorish insurrection in the reign of Philip II. it had its share of resistance and chastisement, and when the Mohammedans were expelled by order of Philip III. a large number were expatriated from Murcia, though some families of the obnoxious race are said still to lurk in the woods and mountains. Those who are desirous of minute information on the local history of the Province will find it detailed in *Cascales Discursos Historicos de Murcia*, fol. Murcia, 1621.

If Phocas be a coward (said the Emperor Mauritius) then is he
murtherous.

Ralegh. History of the World, fol. 588.

2 Y

MURDER.
MUREX.

The first great disturbance in the world after the fall of man was by a *murderer*; whom the vengeance of God pursued to that degree, that he professed that his punishment was greater than he could bear, though he himself could not say, that it was greater than he had deserved. *South. Sermons*, vol. xi. p. 40.

He delights to commission his curse to arrest a bloody Ahab, just as he is going to take possession of the price of blood, and to dash out the brains of a *murderous* Abimelech in the very head of his army. *Id. Ib.* p. 46.

Diana's vengeance on the victor shown,
 The *murdress* mother, and consuming son.
Dryden. Palamon and Arcite.

The name of *murder* (as a crime) was anciently applied only to the secret killing of another; (which the word *moerda* signifies in the Teutonic language;) and it was defined, *homicidium quod nullo vidente, nullo sciente, clam perpetratur.*

Blackstone. Commentaries, book iv. ch. xiv. vol. iv. p. 195.

This [amercement] was an ancient usage among the Goths in Sweden and Denmark, who supposed the neighbourhood, unless they produced the *murderer*, to have perpetrated or at least connived at the *murder*; and, according to Bracton, was introduced into this kingdom by King Canute, to prevent his countrymen the Danes from being privily *murdered* by the English. *Id. Ib.*

Cruel with guilt, and daring with despair,
 The midnight *murderer* bursts the faithless bar,
 Invades the sacred hour of silent rest,
 And leaves, unseen, a dagger in your breast.
Johnson. London.

MURE, *v.* } Fr. *murer*, *muraille*; It. *murare*,
 MU'RAL, } *murale*; Sp. *murar*, *mural*; Lat. *mu-*
 MU'RAGE, } *rus*, a wall, *muralis*. *Murus*, anciently
 MU'RING, *n.* } written *mærus*, is derived by Scaliger and
 Vossius from Gr. *μοῖρα*, *pars*, *rata scilicet cujusque civis*
pars, Scaliger; *quia quisque pro ratâ parte muros, ex-*
truebat, reficiebat, ac tutabatur.

To wall or enwall; to compass or surround with walls; to fortify, to strengthen; to enclose, to shut up.

By Stat. William I. c. 30. citizens and burgesses to whom the King (Edw. I.) or his father had granted *murage* to enclose their walls, are declared subject to forfeiture and fine for taking such *murage* otherwise than granted. See in Rastall. Tolles.

At last, when as he found his force to shrink,
 And rage to quail, he tooke a muzzle strong
 Of surest yron, made with many a linke;
 Therewith he *mured* up his mouth along,
 And therein shut up his blasphemous tong.
Spenser. Faerie Queene, book iv. can. 11.

It is a witty and good observation of Gregory that the prophet prays, set a door before my lips; a door, not a wall: he would not have his tongue *mured* up for all occasions.

Hale. The Enemies of the Cross of Christ. Sermon 13.

Other durst not front the battle of the Macedonians, which was so strongly imbattered on every side, and so *mured* in with a wall of pikes, presenting their armed heads on every side a man could come, that it was impossible to break them.

Sir Thomas North. Plutarch, fol. 213. *Paulus Aemilius.*

Walls are either entire and continual, or intermitted; the entire *muring* is by writers diversly distinguished.

Reliquiæ Wottonianæ. Elements of Architecture, part i. p. 19.

Moreover, hee [Dentatus] woun 26 crowns or triumphant chaplets, wherof 14 were civick, for rescuing of Roman citizens in jeopardy of death; 8 of beaten gold; three other of *murall*, for mounting first over the enemies wall.

Holland. Plinie, vol. i. ch. xxviii.

Where you desire *mural* fruit-trees should spread, garnish, and bear, cut smoothly off the next unbearing branch.

Evelyn. Kalendarium Hortense. January.

MUREX, in Zoology, a genus of *Gasteropodous Mollusca*.

Generic character. Shell oval or oblong, canaliculated at the base, with rough, spinous, or tubercular veins;

aperture rounded or oval; three or more varices in each turn of the spine, the lower ones uniting obliquely with the upper into longitudinal rows; *operculum* horny.

Type of the genus, *M. erinaceus*, Linnæus; Pennant, *Brit. Zool.* vol. iv. pl. lxxix. fig. 1. Inhabit various seas; the type is found on the coast of Britain; the genus is distinguished by having three rows of ridges on each whorl; many of the species are of lively colours, and of considerable size.

MURICARIA, in Botany, a genus of the class *Tetradynamia*, order *Siliculosa*, natural order *Cruciferae*. *Generic character*: calyx segments erect; petals entire, equal, seed vessel coriaceous, globular, one-celled, one-seeded, spiny; seeds globular.

One species, native of the North of Africa. Decandolle.

MURICIA, in Botany, a genus of the class *Monocla*, order *Syngenesia*. *Generic character*: male flower, calyx five-parted; corolla, petals five; filaments three: female flower, calyx and corolla as the male flower, berry one-celled, seeds orbicular, tuberculated.

One species, a large shrub, native of Cochinchina.

MU'RMUR, *v.* } Fr. *murmurer*; It. *mormorare*,
 MU'RMUR, *n.* } Sp. *murmurar*; Lat. *murmurare*;
 MU'RMURER, } Gr. *μωρμύρειν*, properly spoken of
 MU'RMURING, } flowing waters, a little roughened.
 MU'RMUROS. } Vossius does not think from the
 verb *μωρμύρειν*, to flow, but formed from the sound. And
 the application certainly is

To make the noise, to utter the sound of roughly or hoarsely flowing water; or a similar noise or sound: to utter an indistinct, continuous, hoarse sound: met. to utter the sounds of complaint, repining or discontent; to complain, to repine.

As many heds, as many wittes ben
 They *murmured*, as doth a swarme of been,
 And maden skilles after hir fantasies.

Chaucer. The Squieres Tale, v. 10517.

Murmur also is oft among servants and grutchen when hir soveraines bidden hem do leful thinges.

Id. The Persones Tale, p. 156.

And with that soun he herd a *murmuring*
 Ful low and dim, that sayde thus, "victorie"

Id. The Knights Tale, v. 2435.

Hir name is *murmure* and compleint,
 Ther can no man hir chere peint
 To sette a glad semblant therin.

Gower. Conf. Am. book i. p. 27.

But wordes dare I speake none,
 Wherof she might be displeased:
 But in myne herte I am diseased
 With many a *murmure*, God to wote.

Id. Ib.

Make ye no *murmuration*.
 Though I write after this facion.

Shelton. The Boke of Colin Clout.

Those *murmurers* against God, as soone as they repented were healed of their deadly woundes, thorough lookynge on the brasen serpent onely, without medicine or any other help.

Tyndall. Workes, fol. 14. *Prologue to Leviticus.*

Great *murmuring* ther arose in Inglande bitwene the noble herôs and y^e kyngs counsell.

Lord Berners. Froissart. Cronycle, vol. i. ch. vi. p. 4.

The silver-sounding instruments did meet

With the base *murmure* of the water's fall.

Spenser. Faerie Queene, book ii. can. 12.

But as they shewed themselves no lesse than ingrat infidels in the behalfe, so the Lord considered their vnthankfullnesse, and gaue them euer since such scarsitie, as the greatest *murmurers* haue now the least store.

Holinshed. Works, vol. i. p. 392. *The Description of England*, ch. viii.

MUREX.
MURMUR.

MURMUR.
MUS.

But with his clownish hands their tender wings
He brusheth oft, and oft doth mar their *murmurings*.
Spenser. Faerie Queen, book i. can. 1.

What, if God, willing to show the riches of his mercy, calls and
accepts of some at the very last hour of the day, and rewards them
equally with those that came in at first; have we any thing to
reply against such a proceeding, or to carp at his justice, or *murmur*
at our brother's felicity?

South. Sermons, vol. ix. p. 220.

By long obedience he confest
That serving her was to be blest
Ye *murmurers*, let True evince
That men are beasts, and dogs have sense!

Prior. True's Epitaph.

This should silence the proud regrets and *murmurings* of our
hearts, at the absoluteness of God's decrees and purposes: for why
may not his decree be as absolute as his power?

South. Sermons, vol. viii. p. 241.

Round his swoln heart the *murmurous* fury rolls.

Pope. Homer. Odyssey, book xx.

Yet hark, how through the peopled air
The busy *murmur* glows!

Gray. Ode on the Spring.

In the mean time I shall make a shew of some of my defences, if
it be only to convince the *murmurers*, that I shall not capitulate upon
the first summons.

Observer, No. 91.

MURR, } Skinner from Lat. *mori*; Minshew
MU'RRAIN. } from Gr. *μαραινειν*, *tabescere*. It is
from the A. S. *myrr-an*, to *mar*: to dissipate, to de-
stroy.

The old noun *murr*, was applied to that which *mars*
or destroys, (*sc.* the speech or utterance.) *Murrain*:
to that which destroys life: a destructive disease,
plague, pestilence.

And God on hem sendeþ oþer meschaunce *moreyne*.

Piers Plouhman. Vision, p. 42.

The hande of the Lord shal be vpon thy catel which thou hast in
y^e felde, with a mighty great *morayne*.

Bible, Anno 1551. Exodus, ch. ix.

The wodhackle that singeth churre
Horsly as hee had the *murre*.

Skelton. The Boke of Philip Sparow.

This plague of *murrein* continued twenty-eight yeare ere it ended,
and was the first rot that euer was in England.

Stow. Edward I. Anno 1257.

His cattle must of rot and *murren* die,
Blotches and blaines must all his flesh emboss,
And all his people.

Milton. Paradise Lost, book xii. l. 179.

In the latter part of the book he relates the diseases incident to
cattle; and ends with the description of a fatal *murrain* that for-
merly raged among the Alps.

Dryden. The Georgics, book iii. The Argument.

I then had plann'd a life
Where wealth attends the middle stage,
And rest and comfort wait on age,
Where rot and *murrain* ne'er commence.

Cotton. Fable 6.

MURRAYA, in *Botany*, a genus of the class *Decan-*
dria, order *Monogynia*, natural order *Hesperides*. Generic
character: calyx five-parted; corolla, petals five, bell-
shaped; nectary encircling the germen; berry one-
seeded.

One species, *M. exotica*, native of the East Indies.

MUR'REY, *adj.* } From Fr. *morée*, *morel*, *mo-*
MU'RRY, *n.* } *reau*; It. *morello*; Sp. *morado*,

so called from the colour of the *Moors*, *sc.* obscure or
dark, or rather from the colour of the mulberry, (*mori*,)
verging from red towards black. Skinner. Menage
prefers the former.

The chanons of the same chappell in their mantles of *murrey*, and
roundlet of S. George.

Stow. Edward IV. Anno 1476.

The leaves of some trees turne a little *murray* or reddish; and
they be commonly young leaves that do so.

Bacon. Natural History, Cent. vi. sec. 512.

So stibium or glass of antimony, appears somewhat red in glass,
but in its powder yellow; so painted glass of a sanguine red will
not ascend in powder above a *murrey*.

Sir Thomas Brown. Vulgar Errors, book ii. ch. i. p. 58.

On the other side with a shippe, called the Tryumphe, with a
case of *murrey* velvet, weighing three score and thirteen ounces.

Walpole. Anecdotes of Painting, vol. ii. Appendix, sig. x.

And add beside a *murry*-colour'd vest,
Which, in their places, may receive the pest.

Dryden. Juvenal. Satire 6.

MURRION. See MORION.

MURUCUIA, in *Botany*, a genus of the class
Monadelphia, order *Pentandria*, natural order *Passi-*
floræ. Generic character: calyx five-parted, coloured,
furrowed; corolla, petals five; crown of filaments
simple, tubular, truncated; fruit a large berry on a foot-
stalk.

A genus allied to *Passiflora* containing three species,
natives of St. Domingo.

M U S.

MUS, Lin. Cuv.; Rat, Mouse, Pen. In *Zoology*, a
genus of animals belonging to the family *Claviculata*,
order *Rodentia*, class *Mammalia*.

Generic character. Incisive teeth two in either jaw,
those of the lower narrower and more pointed; molar
three on a side above and below; of the upper, the first
has six blunt tubercles, the first two of which are placed
in transverse lines, and the next three in a second, and
the sixth singly in a third; the second and third molars
have four tubercles, of which one is placed in front,
another behind, and two in the middle situated obliquely
from without to within; of the lower, the first has five
tubercles, a single one in front, the others in pairs, the
second four in pairs, the third three, one in front, and a
pair of tubercles behind; tail moderate sized or long,

ringed, scaly, and generally but little covered with hair;
front feet four-toed with a rudimental thumb, hind feet
five-toed; claws falcular.

Linnæus and Pallas have included almost all the
smaller gnawing animals under this generic term, but
they have been separated by Gmelin, Illiger, and
Cuvier into numerous genera, and the genus *Mus* has
been restricted only to such as exhibit the characters al-
ready mentioned. They differ materially in size, varying
between twelve and two and a half inches. They are
distinguished from the Dormice by the obtuse form of
their head, by their less prominent eyes; from the
Hamsters by not having cheek-pouches; from the
Jerboas and others by the equal length of their legs,
which are furnished with delicate toes armed with slender

MUS.

and pointed claws; the toes are not webbed like the Water Rats, nor have they the edges furnished with strong hairs like the Musk Rats. The length of the tail is very various, in some it exceeds, in others equals, and in some is less than that of the body; it is round at its root, tapers towards the point, and the skin covering it is disposed in rings or verticillated scales, between which a few hairs are implanted, but not sufficient to cover the stump of the tail, by which they are distinguished from the laterally flattened tail of the Musk Rat, and the horizontal expansion of that of the Beaver; and by its slight covering from the well-clad tail of the Jerboa and the Water Rat. The greater number of Rats are covered with coarsish hair, but some few have the hair spiny. In their habits, they are omnivorous, feeding indiscriminately on grain, roots, fresh and putrid animal matter, and hence are very frequently found in butchers' shops and slaughter-houses; but when impelled by hunger, they attack each other and the stronger feed on the weaker. Some of them, but not all, lay up store of winter provisions, in burrows which they construct a slight distance below the surface of the ground. They multiply with great facility, and some of them live in the woods and fields, whilst others follow the steps of man, and colonize every part of the Globe in which he settles, becoming one of his greatest pests; their increase on shipboard is often to such extent that it becomes necessary to unlade the vessel completely in order that these troublesome companions may be put to flight, or destroyed by starvation, which is the only remedy for their total removal.

M. Giganteus, Hardwiche; *le Rat Géant*, Desmarest; *Bandicote Rat*, Pen. This is the largest species of the whole genus, the body including the head twelve inches, and the tail of equal length: body thick and arched, so that it has the appearance of a young pig; the muzzle rounded, the lower much shorter than the upper jaw, the incisive teeth very broad; the ears pretty large, rounded, naked, and the lower edge folded; body covered with close hairs of a dusky brown on the back, grey on the belly, and black on the legs; the outer toe of the hind feet very broad and high upon the leg; the tail slightly covered with hair, but quite naked for an inch from its tip, and marked with many indistinct rings. It lives about houses, making great ravages in the gardens and farm-yards, where it destroys not merely grain, but young poultry; it is said to undermine houses, in burrowing, so as to make them fall. It is found on the Malabar and Coromandel coast, in the Mysore, and in Bengal, between Calcutta and Hardwar, and is eaten by the poorer natives.

M. Decumanus, Lin.; *le Surmulot*, Buff.; *Brown Rat*, Pen. About nine inches long, the tail of same length; head, back, and sides light brown, mingled with tawny and ash; the sides lighter, and under parts dingy-white; feet naked and dirty flesh-colour; the front feet four-toed, with a claw instead of the fifth; on the tail may be counted two hundred rings. The Brown Rat is originally native of India and Persia, whence it was introduced into England about the year 1730; in France it did not make its appearance till twenty years after, but since that time it has spread in every direction, and has been imported even into America. They had not penetrated into Russia and Siberia in 1766, but at that period were observed, according to Pallas, coming up from the Westward to the towns of Jaitzkoi, Gorodok, and Astracan, filling the whole bed of the Wolga, and

infesting the houses so that nothing could escape. Like the Water Rat they swim and dive readily, and burrow on the sides of ponds and streams; feed on fruit and corn, and will destroy poultry and game, and if other food cannot be procured, fight and destroy each other. They are very fierce and courageous, and if they cannot escape, will turn and defend themselves boldly, fastening with their teeth on their pursuer. During Summer they live in the fields, but in Winter resort to houses. They have almost completely destroyed the Black or English Rat, and are not unfrequently called Norwegian Rats, but why does not appear. It is said that they have great aversion from the smell of Rabbits and Guinea pigs, which are sometimes kept for the purpose of driving them away. Both in England and France they are now exceedingly common.

M. Javanus, Hermann; *Javan Rat*. About the size of the Brown Rat, but with a shorter tail, of a reddish-brown colour above, with white under parts and legs; the root of the tail is very hairy, but the rest of it covered with large scales. From Java.

M. Indicus, Geoff.; *Indian Rat*. About the size of the Brown Rat; the upper parts and legs greyish-red; under parts greyish. Found at Pondicherry.

M. Alexandrinus, Geoff.; *Alexandrian Rat*. About six inches long, with a tail of eight inches; greyish-brown above tinged with rusty, under parts ashy-grey; legs same colour as the back; tail naked, encircled with a hundred and thirty or forty rings; some of the hairs on the back are remarkable for being flattened and grooved, thus making a transition to the Spiny Rats. About the neighbourhood of Alexandria.

M. Pilorides, Desm.; *Velvet Rat*. A little smaller than the Brown Rat, and of similar form, but its coat is of a bright, shining black colour, except the chin, the throat, and the root of the tail, which are pure white. It is a native of Martinique. It has often been confounded with an animal bearing the same name, and mentioned by Rochefort in his *Travels*, and included by Pennant and Erxleben among the Cavies.

M. Rattus, Lin.; *le Rat*, Buff.; *Black Rat*, Pen. Length of the body seven inches, of the tail rather more; its coat is finer than that of the preceding, of an iron-grey, nearly black above, and cinereous beneath, with a few white hairs on the upper part of the feet. Some varieties are quite black, others yellowish, and some white or albinos. It is carnivorous; makes its nest in a hole near the chimney, and lines it with wool, bits of cloth or straw; is very courageous, and during rutting time often fights fiercely with its fellows. This was formerly the most common European species, but has given way to the Brown Rat, which exterminates it wherever they meet. It does not seem to have been known to the Ancients, and Cuvier imagines it was not known in Europe before the Middle Ages. It was introduced into South America about 1544, during the Viceroyalty of Blasco Nunez, and is now a great nuisance throughout that continent. It was probably imported into this Country from France, as the Welsh still call it *Llygoden Frengig*, or the French Mouse. They are very common in the Society Islands, and at Otaheite are extremely numerous, feed on the bread fruit, and are said to attack the natives when asleep; they are held in great detestation, and the fruit which they have run over is not eaten.

M. Caraco, Pall.; *Caraco Rat*, Pen.; *Characho* and *Jike-Cholgonach* of the Mongols. Body about six inches

MUS.

MUS. and a half long; tail four and a half; colour reddish, mingled with grey, deeper on the back than the sides, under parts ashy-white, the legs dingy-white; tail brown above, ashy beneath, and having a hundred and fifty rings; the toes of the fore-feet, and the middle three of the hind, slightly webbed. It inhabits the Eastern parts of Siberia, and especially Mongolia, and is thought to have come from the Eastern parts of Asia and the Southern Provinces of China. It swims well, and burrows on the banks of rivers and ponds.

M. Brasiliensis, Desm.; *Brasilian Rat*. Much smaller than the Black Rat; the hair short and soft, of a brownish-yellow colour on the back, almost tawny on the sides, and grey beneath; the tail a little longer than the body.

M. Musculus, Lin.; *le Souris*, Buff.; *Common Mouse*, Pen. This elegant though destructive little animal is almost too well known to require description; the length of its body is about three inches and a half, and the tail of nearly equal length; the colour of its sleek, soft coat is above and on the sides ashy-black shot with yellow, each hair being deep ash at its root and throughout the greater part of its length, then merging to yellowish and tipped with black; all the under parts light ash tinged with yellow, especially about the vent; the tail covered with short and very fine hair. Several varieties of this species are found, a very common one of which are the White Mice with red eyes, which are merely albinos; others are yellowish, some light grey, some deep black, and others spotted with white. They are sometimes found in the woods, but most commonly in houses, and are amongst those animals which almost invariably accompany the steps of man. They burrow among the floors, in the walls amidst the plaster, forming long and very complicated galleries, in which they nestle during the day, but during night steal out in search of food. They increase rapidly, the female producing five or six young several times during the year. Nothing seems to come amiss to them; animal or farinaceous food, books, leather, and even linen, are continually subjected to the destructive attacks of such as live in houses, whilst those which inhabit the woods feed on roots and wild fruit. They do not become torpid by cold, and are found as well in the frozen regions of Iceland as in the warm climate of Egypt. This species was the *Mus* of the Ancients.

M. Sylvaticus, Lin.; *le Mulot*, Buff.; *Field Mouse*, Pen. Larger than the preceding, the body measuring above four inches, and the tail three and a half; the head larger and longer, the eyes more full and prominent; the ears of greater length and width, and the legs higher; the upper parts of the body, of the head, the sides of the head and neck, and the external surface of the limbs covered with short, fine, tawny hairs mingled with black; the sides of the muzzle, under parts of the head and body, and insides of the limbs whitish, tinged with ash wherever the fur is longer; on the chest a little tawny spot mingled with blackish, tail brown above and whitish beneath. Like the preceding, they are subject to variety of colour. They never frequent houses, but are found in woods, fields, and gardens, where they burrow and lay up great store of Winter food, nuts, acorns, corn, &c., the scent of which attracts pigs, which do considerable mischief in their endeavours to rifle these magazines. Field Mice are very destructive to corn, and especially to beans which have been just sown, and hence in some parts of England they are called *Bean Mice*. They are common in Europe, and

also in the United States of America, and make their nests either in thick tufts of grass, or just below the surface.

M. Leucopus, Rafinesque; *American Field Mouse*, Richardson. Is considered by the latter author as the representative of the European Field Mouse; it varies from three and a half to rather more than four inches in length, and the tail from two to nearly three inches; the upper parts of the body are brown-black, darkest on the head and back, the sides approaching to yellowish-brown, and with the hips sometimes to reddish-brown; the upper lip, a space on each side of the mouth, the chin, the under parts, insides of the thighs, legs, and feet white; the tail thickly covered with short hairs which hide the scales, its upper surface dark black-brown, under white. This little animal is often mistaken by Europeans for the English Mouse, the peculiarity of its tail being overlooked. It hoards grain and lumps of fat, depositing them in shoes left by the bedside, in the pocket of a coat, nightcap, a bag hung against the wall, &c. Frequently also, Dr. Richardson states, barley was found deposited in drawers, through chinks which were too small to admit the entrance of the animal, and often in a single night as much was laid up as equalled the Mouse in size, making it probable that more than one animal was engaged in the business. In gardens they do much mischief by tracking the maize recently sown, and collecting it into heaps under the loose earth by the side of a stone or a piece of wood. They are found as high as Great Bear Lake, and so soon as a fur post is established they are observed to domicile themselves in the houses; they extend across the American Continent from Hudson's Bay to the mouth of Columbia River, and are, perhaps, not uncommon in the United States. Pennant considers it merely as a variety of the *M. Sylvaticus*.

M. Agrarius, Pall.; *Corn Mouse*, or *Shitnik* of the Russians. About the size of the Field Mouse; head and body ferruginous with a dusky line extending along the back; belly and limbs whitish, the hind legs surrounded with a dusky circle just above the feet. In Russia is found about the villages and corn fields, in Siberia in the woods. Sometimes they are migratory, of which an instance occurred in 1763, or 1764, in which they ravaged the Country about Casan and Ausk; entered the houses, and even carried away bread from the table. They burrow just below the surface of the earth, giving it somewhat the appearance of mole-hills, and forming long galleries, at the end of each of which is a chamber where they lay up their stores, consisting of various kinds of seeds.

M. Vagus, Pallas; *Wandering Mouse*, Pen. Between two and three inches long, with a tail of three inches; pale ash above mixed and waved with black, and with a black line along the ridge of the back; ends of the limbs whitish. Inhabits the Tartarian Deserts, and occasionally wanders about in large flocks migrating from place to place during night. It is seen as high as latitude 57°, about the Irtysh, in beech woods; it is easily affected by cold, and sleeps rolled up on cold nights even in the month of June. It lives in the fissures of rocks, under stones, and in hollow fallen trees.

M. Betulinus, Pall.; *Beech Mouse*. Rather less than the former; the upper parts ashy-rust mingled with dusky, tip of the nose red, with a dark streak along the back, under parts pale ash. Found in the same district as the preceding, and runs up trees, to the branches

MUS.

MUS. of which it clings by the tail. Desmarest considers this and the preceding but as one species, and calls it *M. Subtilis*.
MUSA.

M. Campestris, Desm.; *le petit Mulot, ou Mulot des Champs*, Buff. *Short-tailed Mouse*, Pen. This very nearly resembles the last species, but differs from it in having the tail more than half an inch shorter, instead of half an inch longer than the body; the roots of the hairs on the upper parts of the body are greyish-slate, and their tips tawny, but on the sides the latter colour fades; the under part of the neck, chest, belly, and legs white; the tail scaly and slightly covered with grey hairs. It lives in burrows at a little distance from villages.

M. Messorius, Shaw; *le Rat des Moissons*, Desm.; *Harvest Mouse*, Pen. Two inches and a half long, the tail two inches more; very similar to the preceding; the upper parts very tawny, as is also the tail; under parts and legs white; a yellowish-grey, longitudinal streak on the sides of the body separates distinctly the tawny colour of the back from the white belly. It prefers rocky districts, but spreads over the fields, making great destruction among the corn. During Summer it builds a spherical nest of blades of corn, which it suspends either among the stalks of corn or on high grass, and in Winter it burrows very deep, making a round nest which it lines with moss. Desmarest thinks that it is probably the same species as the *M. Pendulinus* of Hermann, on account of the similarity of its manners. It is found in Germany and England, especially in Hampshire.

M. Soricinus, Hermann; *le Rat Nain*, Desm.; *Dwarf Mouse*. Is about the same size as the preceding, but the tail equals the length of the body, and it is characterised by the great elongation of the muzzle; the upper parts are yellowish-grey, the under white. It is found about Strasburg.

M. Striatus, Lin.; *Oriental Mouse*, Pen. About half the size of the Common Mouse; is of a grey colour and marked with twelve longitudinal rows of pearly spots from the head to the rump. It is found in India and Guinea.

M. Barbarus, Lin.; *Barbary Mouse*. Brown, marked with ten slender whitish lines on the back; the fore feet only three-toed with a rudimental thumb. Native of Barbary.

M. Pumilis, Sparrman; *Lineated Mouse*, Pen. General colour cinereous-brown; forehead and occiput black, from the latter four black lines extend along the back; tail light coloured and small. Found in the Sit-

sicamma Forest on the Slangen River far to the Eastward of the Cape of Good Hope.

M. Minutus, Pall.; *Little Mouse*, Pen. Little more than two inches long, the tail not so long; upper parts deep tawny with a whiteness at the corner of the mouth; under parts white; feet grey. Found in the temperate parts of Russia and Siberia, in the fields, barns, and among the beech forests.

Two other Rats are described by M. Rafinesque Smaltz, as existing in Sicily, but Desmarest thinks they probably belong to the Dormice. They are the

M. Frugivorus, Rafinesq.; *Frugivorous Mouse*. Of which the fur is brownish-red, with a few longer brown hairs above, and white beneath, the tail of equal length with the body, brown, ringed, ciliated and cylindrical. It lives on fruit, and builds in the trees.

M. Dichrurus, Rafinesq.; *Square-tailed Mouse*. Tawny, mingled with brownish above and on the sides; belly white; head marked with a brownish band; tail brown above, white beneath, rather squarish, like that of the Shrews. It lives in the fields, and falls asleep during the Winter.

The following Rats are remarkably distinguished from the preceding by the increased hardness and roughness of some of the hairs on the back, which resemble spines, and seem to connect this genus with the Porcupines.

M. Perchal, Gmel.; *le Rat Perchal*, Buff.; *Perchal Rat*. Above a foot in length, and the tail eight or nine inches; upper parts of the body deep brown, the under parts grey, lighter on the neck and belly; the fore legs very strong. It inhabits the houses at Pondicherry, and is occasionally employed by the natives as food.

M. Cahirrinus, Geoffr.; *Cairo Rat*. Body four inches long, and tail of the same length; its back covered with rough spines of a deep ash-grey colour, becoming softer on the sides and the colour inclining to red; throat and belly whitish-grey; feet dirty white; tail greyish, scaly, with a few scattered grey hairs. Native of Cairo.

The American Rats mentioned by Molina are not sufficiently characterised, according to Cuvier, to determine their proper station, but they are all included by Desmarest in this genus.

See Linnæi *Systema Naturæ* a Gmelin; Cuvier, *Règne Animal*; Desmarest, *Mammalogie*; Pennant, *History of Quadrupeds*; Richardson, *Fauna Boreali Americana*.

MUSA, in Botany, a genus of the class *Hexandria*, order *Monogynia*, natural order *Musæ*. Generic character: calyx a one-leaved sheath, many-flowered; corolla of one strap-shaped, five-toothed petal, nectary of one leaf, opposite the petal; berry many-seeded, inferior, in some of the flowers: sometimes the stamens or pistil are abortive.

There are four species of this genus, natives of Tropical Countries, where their magnificent foliage adds very considerably to the beautiful scenery produced by the luxuriant vegetation.

M. paradisiaca, the plantain tree, is a native of the East Indies, and is cultivated very generally in hot Countries, and constitutes a large proportion of the food

of the inhabitants. The root of the plant is perennial, but the shoots are annual, and rise to the height of from fifteen to twenty feet, one leaf, and its stalk is as much as a man can carry. The fruit is about the size of a cucumber, and is produced in long pendent bunches, one on a plant.

M. sapientum, the Banana, is also cultivated for its fruit, which is very grateful.

MUSCA, in Zoology, a genus of *Dipterous* insects.

Generic character. *Antennæ* incumbent, three-jointed; the third joint elongate, obtuse, prismatic, compressed; the base of the latter with a plumose, dorsal seta; *abdomen* ovate, setose; wings two, divaricating, with a transverse nerve at the apex.

MUS.
MUSCA.

MUSCA. Type of the genus, *M. domestica*, Linnaeus; Degeer, *Ins.* vol. vi. pl. iv. fig. 5—10.

MUSCICAPA. A very numerous genus, containing upwards of fifty European species, of which at least thirty are found in Britain.

MUSCADEL, } Fr. *muscadell*, *muscat*; It. *mos-*
MUSCADINE. } *catello*, so called either from their scent of *musk*, or because flies (*muscae*) feed eagerly upon them; in confirmation of the latter the *Uvæ Apianæ* of Pliny are referred to. See Menage and Skinner; and the Quotation from Pliny.

And at night to banquet with dew (as they say) of all manner of fruits and confections, marmelade, succad, grene ginger, comfeittes,

sugar plate, with malmesay & romney burnt with sugar, synamon & cloues, with hastarde, *muscadell* and ipocrasie. Tyndall. *Workes*, fol. 229. *Exposition upon the sixth chapter of Mathew.*

As touching the *muscadell* wines, (*Apianæ*) they tooke that name of bees, which are so much delighted in them, and desirous to settle and feed of them. Holland. *Plinie*, book xiv. ch. ii.

Most decoctions of astringent plants, of what colour soever, do leave in the liquor a deep and *muscadine* red.

Sir Thomas Brown. *Vulgar Errours*, book vi. ch. xii. p. 412.

This will buy brawn this Christmas yet, and *muscadine*.

Beaumont and Fletcher. *The Loyal Subject*, act iii. sc. 4.

The fluid and finer part of the mixture passing through in the form of a liquor, high coloured, almost like *muscadine*.

Boyle. *Workes*, vol. iii. p. 118. *Usefulness of Natural Philosophy*, part ii. ch. ii. ess. 5.

MUSCA.
—
MUSCICAPA.

MUSCICAPA.

MUSCICAPA, from the Latin *musca*, a fly, and *capio*, I take, Lin. Tem.; *Flycatcher*, Pen. In Zoology, a genus of animals belonging to the family *Dentirostres*, order *Passeres*, class *Aves*.

Generic character. Beak of moderate size, strong, angular, depressed at the base, and more or less wide, compressed at the tip, which is strong, hard, curved, and deeply toothed; long, rough bristles at the base of the beak; nostrils ovoid, basal, lateral, covered partially by bristles directed forwards; tarsi rather longer than the middle toe; three toes in front, of which the lateral are generally of equal length, and the outer connected at its base with the middle, and one toe behind; the first alar quill the shortest, the second longer, the third and fourth longest.

A large proportion of the birds forming this genus belong to warm climates, and exhibit great variation in the form of their beak, dependent on the different kinds of insects upon which they feed. In some the beak becomes flattened and elongated so as nearly to approach the *Todi*; in others it runs on the one hand to the broad-based beak of the *Platyrhynchi*; in others to the strong curved beak of the *Edolii* and *Lanii*; some pass to the slender delicate beaks of the *Sylviae*, whilst others run towards the *Tamnophyli* and *Myotheræ*. In their habits the Flycatchers approach the Shrikes, being of a quarrelsome and spiteful disposition, driving away from their haunts all other insectivorous birds, and even chasing each other. They feed on flies and other winged insects, which they take on the wing, but never on the ground, and rarely even on the leaves of trees. In Europe, for the most part, they live alone in the forests, upon the tops of the trees, and lay but once a year.

They have been divided into Geographical sections, as they are generally distributed in particular districts, and do not pass from one to the other.

Sect. I. European Flycatchers.

M. Grisola, Lin.; *le Gobe Mouche proprement dit*, Buff.; *Spotted Flycatcher*, Pen. Rather larger than the Common Sparrow; the upper parts ashy-brown; the forehead inclining to whitish; the feathers of the head marked with a longitudinal brown streak; throat and middle of the belly white; sides of the neck, chest, and belly marked with longitudinal ashy-brown streaks. The Spotted Flycatcher makes its appearance in England and France in the Spring and leaves us about Sep-

tember, when the dipterous insects on which it feeds become scarce. It is of a dull aspect and naturally fierce, never sings, but utters a piercing, disagreeable cry. It lives in the woods, and builds its nest of moss, wool, or hairs, intermingled with roots, in the hollows of rotten trees, and sometimes in holes of walls, or even in bushes, and lays five or six eggs bluish-white spotted with rust colour. It is common throughout Europe.

M. Albicollis, Tem.; *M. Atricapilla*, Gmel.; *le Gobe Mouche à collier de Lorraine*, Buff.; *White Collared Flycatcher*. The size of a Sparrow; the top of the head, cheeks, back, lesser wing-coverts, and all the tail quills deep black; the forehead, a broad collar on the back of the neck, and all the under parts pure white, excepting the rump, in which is mingled some black; on the alar quills near their origin a white band, and the middle and lesser wing-coverts white, the latter tipped with black on their inner edge. Such is the Spring plumage of the old male; from which the female differs, in having all the upper parts greyish-ash, except a very small ashy-white space on the forehead, the externally white great wing-coverts, and the two lateral caudal quills, which are edged with white; all the under parts are pure white; the white collar on the neck does not exist, and is merely indicated by the ashy colour being lighter at that part than elsewhere. In Winter the male assumes the same plumage. This bird is found more commonly in the central than in the other parts of Europe, it is less frequently seen in Germany, and the North of France, and never in Holland; it is occasionally, but by no means frequently, found in England. It lives in thick and extensive forests, builds in the holes of trees, and lays five or six greenish-blue eggs, dotted at the larger extremity with delicate brown spots.

M. Luctuosa, Tem.; *le Traquet d'Angleterre*, Buff.; *Pied Flycatcher*, Pen. Size of the last; all the upper parts and the tail quills deep black; the forehead and under parts clear white; the wings black, their middle and greater coverts white, and the inner webs of the latter tipped with black. Previously to the plumage of the male acquiring its deep black colour, numerous grey feathers are observed scattered about on a black ground; the alar and caudal quills are blackish, and merely the outer two of the latter edged with white; in the second year the outer caudal quill alone is edged with white, and in the third, in which the plumage attains its perfection, neither of the caudals have the white edge. The old female has no white mark on the wing, the upper

MUSCI-
CAPA.

parts are of a uniform ashy-brown, and the three lateral caudal quills are edged with white: the same characters also distinguish the young and the males in Winter, and have been described as a separate species under the name *Motacilla Ficedula*, Gmel.; the *Becfigue* of Buffon.

There is great difficulty in distinguishing the Pied from the White Collared Flycatcher. In Summer the males are easily distinguished after the second Spring moult, the latter having the neck completely encircled with a white collar, whilst the former has the back of the neck still black. Of the females, the White Collared is distinguished by the little white patch on the wings, whilst the Pied Flycatcher has none; and as to the caudal quills, in the White Collared the two outer have a more or less broad white edge according to their age, whilst the Pied has the outer three edged with white. They are commonly found in the Southern parts of Europe, along the Mediterranean, in the central parts of Germany and France, rarely in England, and never in Holland. They live in woods, in parks, and even in gardens, in Italy among the olive and fig-trees, and build their nests in the united branches of adjoining trees, and lay about six eggs of a very light greenish-blue colour. They feed on flies and other little insects, which they pick off the surface of ripe fruit and leaves; Vieillot, however, states, that these birds feed rather on the pulp of the fruit than on insects.

M. Parva, Bechstein; *le Gobe Mouche Rougeâtre*, Tem.; *Little Flycatcher*. About half an inch shorter than the preceding; the upper parts of a reddish-ash colour, which assumes a bluish tinge about the ears; alar quills ashy-brown; the middle four caudal, and the tips of the lateral blackish, the latter white from their roots; the throat, front of the neck, and chest bright rust; the sides reddish; the other under parts white; the beak and legs brown; the hairs at the base of the beak very long. In the female all the colours are paler. These birds are very rare in Europe, and are found only in the extensive forests of Germany, where they remain just long enough to bring up their young; but towards the East they are common.

Sect. II. Asiatic Flycatchers.

M. Cyanocephala, Gmel.; *Blueheaded Flycatcher*, Lath. About the size of a Linnet; the head deep blue, almost black, the throat and upper parts of the body deep red, the under parts light brown; the tail forked. From the Ile de Luçon.

M. Sinensis, Gmel.; *Chinese Flycatcher*, Lath. Rather larger than a Sparrow; is distinguished by a white streak, which, proceeding from the angle of the upper mandible, encircles the black top of the head.

M. Subflava, Vieill.; *Oranor Flycatcher*. About the size of our Linnet, but the body is more slender, and the tail very long; the head, throat, and upper parts black, glossed with bluish-grey, the under parts, rump, lateral tail feathers bright orange; legs and claws blackish-brown. Native of Ceylon.

M. Melanictera, Gmel.; *Ceylonese Flycatcher*. The size of a Goldfinch; the head and cheeks black; chest yellow; back yellowish-ash; alar and caudal quills blackish; legs pale blue. Native of Ceylon, where it is called *Malkala Kourla*, and is kept in cages on account of its singing.

M. Aëdon, Gmel.; *Musical Flycatcher*. About the size of a Nightingale; the upper part of the body rusty-

brown, the under white; tail ashy-brown, the central quills of which are of equal length, but the others shorter. It is found especially among the rocks and in the valleys of Eastern Tartary, and its nightly song is compared by Pallas to that of a Nightingale.

M. Cantatrix, Tem.; *Singing Flycatcher*. Rather larger than the Common Sparrow; the beak flat, and in form of an elongated cone on its upper surface; the tail long, and its quills equal, and not more than a third covered by the wings; a narrow, azure-blue stripe passes across the forehead above the eyes, in the male; the lore velvet-black; the top of the head, neck, back, wings, and tail white; the remiges and under parts of the tail black; throat, front of the neck, and under parts light ferruginous. In the female the lore and ocular circlet are whitish, the head and neck ash, the back olive. It is found in the woods of Java, where it sings very sweetly.

M. Miniata, Tem.; *Vermilion Flycatcher*. In the male the top of the head and the throat are black, and of a steel-like lustre; the upper part of the back and scapulars golden-red; the lower part of the back, chest, belly, rump, and under surface of the wings very bright vermilion-red; alar quills vermilion, tipped with black, and caudal black, tipped with vermilion, and slightly graduated. In the female the colours are more dingy. Found in the mountains of the interior of Java.

M. Flammea, Forster; *Parus Peregrinus*, Sparrman; *P. Malabaricus*, Lath.; *Flaming Flycatcher*. This species is connected with the preceding, and with the Oranor Flycatcher, by its graduated tail; the head, nape, back, part of the wings, the four central caudal quills, and the origins of the lateral ones, in the adult male, shining black; the other parts of the tail, the alar quills, the chest, and under part of the body orange. The female has the forehead and rump olive-yellow; the top and back of the head, the nape, and back blackish-ash, and all the under parts yellow. Native of Java, Sumatra, Banda, Ceylon, &c.

M. Javanica, Gmel.; *Longtailed Javan Flycatcher*. About the size of the common Flycatcher, but with a very long and rounded tail; beak, legs, upper part of the throat, and caudal quills black, except their tips, which are white, as is also the belly. From Java.

M. Hirundinacea, Tem.; *Swallow-like Flycatcher*. The upper parts black, with blue glossings, the under white in the male; the female has the upper parts deep brown and blackish.

M. Rosea, Vieill.; *Rosy Flycatcher*. Head, back, and wing-coverts grey, the rump and upper surface of the tail grey, tinged with rose colour; the chin and throat white; front of the neck and chest rose colour, several of the alar quills reddish-brown, which is best seen when the wings are closed; tail graduated, the outer webs partly red. In those which are considered females, a jonquil-yellow replaces the red. From Bengal.

M. Hyacinthina, Tem.; *Hyacinthine Flycatcher*. About the size of a Sparrow, and similar in form to the common European Flycatcher; lore black, forehead, throat, and chest brilliant azure-blue; top of the head, back of the neck, and all the upper parts beautiful blue, slightly inclining to ash; alar and caudal quills brown, edged with bluish; belly and other under parts bright ferruginous. In the female the upper parts and wings are tinged with greenish-ash, and the under with rose

MUSCI-
CAPA.

MUSCI-
CAPA.

colour. From the Timor Islands in the Indian Archipelago.

To the Indian species may also be added, the *M. Carinata* of Swainson, and the *M. Obscura*, *Indigo* and *Banyamas*, enumerated by Horsfield in his *Zoological Researches in Java*.

Sect. III. *African Flycatchers.*

M. Cyanomelas, Vieill.; *Blue-black Flycatcher*. Both sexes have crests, which are elevated when they expand the tail in a similar way to the Turkeys; in the male the crest and neck are black with a bluish tint; the back and rump bluish-grey; the wings crossed by a white stripe; under parts clouded with bluish-grey on a white ground; beak and legs bluish-black; irides cinnamon colour. The female has the scapulars, wings, and tail light brown. These birds are found about the Cape of Good Hope, in the forests of Anteniquoi, and in the Mimosa woods of Cafreland; the male utters a little, shrill, lisping cry, *schrett, schrett*.

M. Lunulata, Le Vaill.; *Spectacled Flycatcher*. Has the same mode of expanding the tail as the last mentioned; the eyes surrounded with a white circlet resembling spectacles; the upper parts of the body brown; the male has the upper part of the neck black, which extends down on the white under parts.

M. Scita, Vieill.; *Zizit Flycatcher*. Has the same size and elegant form as the Longtailed Titmouse; the general plumage is bluish-grey above, and white beneath; a black streak passes from the beak to the ears; the middle of the throat and chest slightly clouded with reddish, but in the female is not seen till the feathers are separated. It is found in Cafraria, especially in the Great Namaquois, and on the banks of the Orange River, where it discovers itself by the cry *zizizit*, among the tufts of bushes, in which it lies in ambush for the gnats, and on their approach it is seen flying about with great agility.

M. Undulata, Gmel.; *Undulated Flycatcher*. According to Le Vaillant this so closely resembles the common European Flycatcher, as to be easily confounded with it. Whilst Vieillot finds it so similar to the Flycatchers described by Buffon as coming from the Isle of France, that he thinks them the same species. The distinctive characters, however, according to Le Vaillant, are, in this having the outer caudal quills shorter, whilst in the European they are longer, and render the tail slightly forked, and in having only fourteen instead of seventeen alar quills. It is very common in the Anteniquoi Country and on the coast of Natal: the cry of the male is *tzirer chrest*.

M. Stellata, Vieill.; *Stellated Flycatcher*. The head bluish-grey; between the beak and eye on each side a little white star, and a collar of the same colour at the lower part of the neck; upper parts olive-green, under yellow. In the Spring the male utters a cry similar to that of the Chaffinch. They build in trees, in the forking of the lower branches, a nest composed of interlacing grass covered with moss, and lined internally with fine roots.

M. Aurea, Vieill.; *Golden Flycatcher*. Upper parts azure-blue; under orange-red in the male, white in the female. They are rather fierce, feed on caterpillars and spiders, and make their nest in the forks of the Mimosa branches; their cry is *pict-pict-piereret, piereret*.

M. Pistrinaria, Vieill.; *Miller Flycatcher*. The male

is about the size of the greater Titmouse, of a reddish-brown colour, clouded with olive on the head and upper parts of the body; wings and tail blackish, edged with white; a black streak passes through the eyes; a white band separates the black throat and chest, the sides are red, the other under parts white. The female is rather smaller, and has the throat, breast, and belly ferruginous-red. In the neighbourhood of the Anteniquoi Country they are found, and the male utters a rough cry, *grerrrrar, grerrrrar*, very similar to the grating of a pair of millstones, and hence the Dutch colonists have called them Moolenars or Millers.

M. Pririt, Vieill.; *Pririt Flycatcher*. The same size as the last, and like it the chest of the male has a large black mark; the white of the throat and front of the neck descends on either side, forming a kind of collar; the top of the head and upper parts of the body are slaty-grey; the under parts white. It is common on the Eastern and Western coasts of Africa. Both the latter species approximate to the *Saxicola*.

M. Cærulea, Lath.; *Cærulean Flycatcher*. The head, back, and front of the body azure-blue, excepting two black spots, one on the nape and the other on the chest; the belly is white: the female is of a lighter blue, but unspotted with black. This bird is found on the coast of Natal and in Cafreland; it builds on the tops of trees, amongst the thickest branches, a nest consisting externally of moss and internally of fibrous twigs.

Sect. IV. *American Flycatchers.*

M. Canadensis, Lath.; *Canadian Flycatcher*. About four and a half inches long, therefore not quite so large as our Common Sparrow; the middle of the top of the head black, the occiput ash; the back, upper tail-coverts, and under parts of the body yellow, spotted on the front of the throat with black; rump whitish; alar and caudal quills brownish-grey. Canada.

M. Cristata, Vieill.; *Motacilla Crist.* Gmel.; *Sylvia Cristat.* Lath.; *le Figuier Huppé*, Buff.; *Crested Flycatcher*. Four inches long; the upper parts of the body whitish-grey, the under brown inclining to green; the crest consists of little rounded feathers, edged with white on a brown ground. Found in the open districts of Guiana.

M. Atra, Gmel.; *Black Flycatcher*. The head blackish, as also the alar quills, which are edged with white; chest ash, and belly pale yellow; legs black. It is found about New York, and there called the Bee Eater, from its feeding on those insects.

M. Fuliginosa, Lath.; *Dusky Flycatcher*. Brown above, white beneath, except the chest, which is yellow. From Cayenne.

M. Virgata, Lath.; *Striped Flycatcher*. Top of the head yellowish; upper parts brown; the wings crossed with two rusty bands; under parts ash, marked with little, longitudinal, brown spots. From Cayenne.

M. Agilis, Gmel.; *Agile Flycatcher*. About four inches and a half long; has the form and colour of the European Yellow Wren, but the beak is flattened. From Cayenne.

M. Ruticilla, Lath.; *Yellow-tailed Flycatcher*, Edwards. Same size as the last; head, throat, upper parts of the body, and tail black; the roots of the caudal, the middle of the alar quills, and the sides of the chest, orange yellow, this in the female is simply yellow, and the black replaced with deep grey and brownish-black. In the

MUSCI-
CAPA.

MUSCI-
CAPA.

Summer it is found in the United States, from Autumn to Spring in Mexico and the Great Antilles.

M. Alector, Pr. Max. de Neuwied; *Alectorian Flycatcher*. Is remarkable for the disposition of its tail-feathers in two vertical planes, in which it resembles the *Alectores*. Vieillot formed of it a new genus, under the name *Alectrurus*, but De Neuwied and Temminck consider it as belonging to the Flycatchers. The male has the forehead and cheeks marbled with black and white, all the other upper parts and a semicircular badge on the sides of the chest deep black when the moult is perfect, but till then varied with brown; the shoulders, roots of the alar quills, and part of their outer webs, the throat, and under part of the body white; caudal quills black, the middle two have their webs elongated into a delicate thread half an inch in length. The female differs from the male in having the tail always pendent, slightly arched, and in form of an inverted groove; the upper part of the body dull brown, the throat white, the semicircular badge reddish, and the other under parts reddish-white. Its habits are similar to those of the Flycatchers. From the Brazils and La Plata.

M. Diops, Tem.; *Double-eyed Flycatcher*. Has a yellowish-white spot between the beak and the eye, giving the appearance of a second eye; the upper mandible is brown, the under white; upper parts of the body light green, slightly inclined to olive; edges of the alar and caudal quills olive; throat and chest ashy-grey; belly white. From the Brazils.

M. Eximia, Tem.; *Beautiful Flycatcher*. Top of the head bluish-ash; ocular circlet white; lore and throat varied with green and white; front of the neck and chest yellowish-green; upper part of the body light green. From the Brazils.

M. Flammiceps, Tem.; *Flaming Flycatcher*. The feathers on the top of the head longish, those of the centre in the male of a fiery colour, in the female rusty; all the upper parts golden-brown, with spots of the same on the whitish ground of the neck and chest; the wings black-brown, and their coverts crossed with little reddish bands; tail brown. From the Brazils.

M. Gularis, Natterer; *Gorgeted Flycatcher*. Top of the head and back of the neck blackish-ash; cheeks light red, which is extended above the eyes and on the sides of the neck; back, alar and caudal quills greenish; throat and under parts ash. This species leads from the *Muscicapæ* to the *Todi*. From the Brazils.

M. Straminea, Natt.; *Straw-coloured Flycatcher*. About three inches and a half long; the male has a little reclining crest, white in the centre and blackish on the edges; cheeks leaden, nape ash, back ashy-olive; wings and tail blackish edged with white; throat and chest light ash, under parts straw colour. This species very nearly approaches the *Pari* in the form of its beak. From the Brazils.

M. Sternera, Tem.; *Slender-tailed Flycatcher*. About four inches long; the lore, forehead, and band which passes through the eyes pure white; the feathers on the head and neck black with white edges; the general colour is rusty-red, with black streaks upon the upper parts; the blackish tail is tipped with white; the throat and middle of the belly yellowish-white; beak and legs black. Temminck has some doubts in placing this species among the Flycatchers, on account of the plane surface of its mandibles, in which it resembles the *Meriones*, and of the shortness of its wings, and the length of its tail, which is graduated and consists of very delicate feathers. It comes from Brazil.

M. Cæcio, Pr. Max. de Neuw.; *Leaden Flycatcher*. The male is almost completely bluish-ash, and the beak black; the female has the head, neck, and back tawny-brown; the chin whitish; belly deep rust; wings and tail brown. Temminck thinks this had better be placed in the last section of the *Laniæ*, or with the *Myotheræ*, its tarsi being but little longer than those of the latter, and its beak less strong than some of the former.

MUSCI-
CAPA.Sect. V. *Oceanic Flycatchers.*

M. Rhodoptera, Lath.; *Rosy-winged Flycatcher*. Back brown; head feathers slender and spotted with black; the middle of the alar and the greater part of the caudal feathers rose colour; under parts white; beak and legs brown. From New South Wales.

M. Rufifrons, Lath.; *Rufous-fronted Flycatcher*. About the size of a Nightingale; the forehead, cheeks, dorsal region, and origin of the caudal quills deep rufous; top of the head pale brown; wing-coverts, part of the caudal quills, belly, and rump, and other under parts, yellowish-white, spotted with black. It makes its appearance in New South Wales about November, and is called the Burriel.

M. Coccinigastra, Lath.; *Red-bellied Flycatcher*. Rather larger than our Common Sparrow; the forehead and eyes included in a large black spot; chin and sides of the neck white; upper parts of the body olive; wings partly white, partly black; tail long, its quills white, except their base, which is black, the middle two are completely black; chest and belly deep red; beak and legs brown. New South Wales.

M. Melanocephala, Lath.; *Black-headed Flycatcher*. The head and neck black; the under parts of the body white, streaked on the chest with black.

M. Barbata, Lath.; *Black-cheeked Flycatcher*. The upper part of the body brown, the under yellow; tail very long.

M. Flavigastra, Lath.; *Yellow-bellied Flycatcher*. About the size of a Sparrow; the back and wing-coverts slaty-grey, alar and caudal quills black; under parts of the body pale yellow.

M. Cucullata, Lath.; *Hooded Flycatcher*. The head profusely covered with black feathers, which give it the appearance of great size; the upper parts of the body of the same colour; the under white.

M. Australis, Lath.; *Ash-brown Flycatcher*. Upper parts ash-brown; under parts yellow.

All the above are from New South Wales: the following from the South Sea Islands.

M. Nigra, Gmel.; *Black Flycatcher*. About five and a half inches long; entirely black. Found at Otaheite and the Sandwich Islands.

M. Erythrogastra, Lath.; *Carmine-bellied Flycatcher*. Head, neck, back, wings, and tail black; forehead and middle coverts white; chest and belly carmine; rump reddish. In the female those parts are brown which in the male are black; chest and belly pale orange; sides and anal quills yellowish-white.

M. Obscura, Lath.; *Dusky Flycatcher*. About seven inches long, three inches of which belong to the tail; the prevailing colour is brown, inclining to reddish on the belly.

See Linnæi *Systema Naturæ* a Gmelin; Temminck, *Manuel d'Ornithologie*, and *Planches Coloriées*; Le Vaillant, *Ornithologie d'Afrique*; Latham, *General History of Birds*; Pennant, *British Zoology*.

MUSCI-
PETA.

MUSCIPETA, from the Latin *musca*, a fly, and *peto*, I seek, Cuv., Tem.; *Flyseeker*. In Zoology, a genus of animals belonging to the family *Dentirostres*, order *Passeres*, class *Aves*.

Generic character. Beak long, very much flattened from above downwards, and often swelling at the sides; upper mandible with a very obtuse ridge hooked and curved on the lower; its tooth very feeble; lower mandible much depressed and pointed towards the tip; base of the bill beset with long hairs which often exceed its whole length; nostrils basal, open, and slightly hidden by the long hairs; wings of moderate size, the first three quills graduated, the fourth and fifth the longest; legs slight, of moderate length or short; lateral toes of unequal length, the outer united to the middle as far as the second joint, the inner only at the base.

The birds forming this genus have been separated from the Flycatchers by Cuvier and Temminck on account of the greater width and comparative weakness of their beak, the length of the hairs situated about its base, and the unequal length and connection of the lateral toes. They are generally of slender make, and therefore only capable of catching insects. Some are furnished with crests on the head or long feathers in the tail, and some have a remarkable membranous circlet about the eyes. None are found in Europe.

Sect. I. Asiatic Flyseekers.

M. Plumbea, Tem.; *Todus Plumb.* Pallas; *Plumbeus Flyseeker*. About the size of a Wren; leaden-grey above, becoming dusky towards the head, milk-white beneath; the alar and caudal quills black, the former and the secondary coverts edged with white, as are also the lateral caudal quills; beak cinereous. From Surinam.

M. Paradisea, Tem.; *Upupa Paradisea*, Gmel.; *le Promerupe*, Buff.; *Paradise Flyseeker*. About the size of a Starling; head and neck shining black; the top of the former adorned with a crest two inches long; the back, shoulders, wings, rump, and tail pale brown; under parts and under tail-coverts pale ash; caudal quills three inches long, except the middle two, which are fourteen inches. Native of India.

M. Borbonica, Tem.; *le Gobe Mouche huppé de l'Isle de Bourbon*, Buff. *Bourbon Flyseeker*. Rather larger than our Common Sparrow; head greenish-black, glistening with violet; back, lesser wing-coverts, and tail pale brown; alar quills black edged with brown, middle coverts black with a rufous tip, greater coverts black tipped with white; beak grey; legs dusky. From the Isle of Bourbon.

M. Mutata, Cuv.; *le Schet-all*, Buff.; *Schet Flyseeker*. About the size of a Finch; the head crested; bluish streak above the eyes; head, neck, and back greenish-black, the latter varied with white; under parts white; wings black, streaked in the middle with white; tail wedge-shaped, seven inches and a half long, the two middle quills exceeding the length of the others by more than four inches, and marked with a black spot at the tip, the others white on their inner and black on their outer web; beak and legs black. From Madagascar.

M. Philippensis, Cuv.; *Philippine Flyseeker*. About the size of a Nightingale; the upper part of the body greyish-brown, the under white; above each eye a white stripe.

M. Luzoniensis, Cuv.; *Luzonian Flyseeker*. Head, throat, upper part of the neck, back, wings, and tail black, inclining to violet; chest, belly, and sides blackish-

grey; on the middle of each wing a white spot; beak and legs black.

M. Flavicollis, Cuv.; *Yellow-necked Flyseeker*. About six inches long; forehead and spot on the cheeks black; ocular circlet yellow, as is also the neck, which assumes a reddish tinge on the sides of the chest; upper parts of the body and belly green, the latter marked with three yellow spots; wings and tail blackish with yellow edge, the latter much forked; beak red. From China.

M. Cyanea, Cuv.; *Blue Flyseeker*. About the size of a Wheatear; the general colour of the male is deep blue, except the belly and rump, which are red; the beak black and the legs brown; in the female the upper parts are bluish-grey; the throat, the front of the neck, and chest red. From the Isles of Timor.

Sect. II. African Flyseekers.

M. Afra, Cuv.; *African Flyseeker*. About seven inches and a half long; upper part of the head red streaked with black; wings and tail red; other parts of the body dingy yellow, marked irregularly with blackish spots. From the Cape of Good Hope.

M. Deserti, Cuv.; *Desert Flyseeker*. In form this bird resembles the Long-tailed Tit; the whole plumage soot coloured, beak pale yellow, and legs black; the tail once and a half as long as the body. Found in the African Deserts, on the borders of the river Hevi, and towards the source of the Quamodacka.

Sect. III. American Flyseekers.

M. Petechia, Cuv.; *Petechial Flyseeker*. About the size of the Crested Lark; the head, upper parts of the body, wings, and tail deep brown; under parts transversely undulated with white and grey tinged with rusty-brown, which becomes reddish on the tail-coverts; tail square. From Martinique.

M. Armillata, Cuv.; *Ringed Flyseeker*. Rather more than six inches in length; ocular circlet and spot on each side of the throat white; head and upper parts slaty-grey; alar and caudal quills blackish, of the latter the three outer partially white; under part of the body rusty-brown, around the lower part of the legs a beautiful yellow ring. From the Antilles, and especially common at Martinique.

M. Spadicea, Cuv.; *Brown Flyseeker*. About six and a half inches long; the head and upper parts of the body reddish-brown; under parts dusky; rump yellow.

M. Cinnamomea, Cuv.; *Cinnamon Flyseeker*. Is very similar to the preceding. Both are found at Cayenne.

M. Cayanensis, Cuv.; *Cayenne Flyseeker*. The male has a long occipital crest of a beautiful orange colour; throat white; under parts jonquil-yellow.

M. Martinica, Cuv.; *Martinique Flyseeker*. General colour brown above and ashy beneath; it has a crest consisting of feathers, which are white at the base and brown at the tip, but is only visible when the bird erects its feathers.

M. Fusca, Cuv.; *Dusky Flyseeker*. Tip of the head blackish; upper parts of the body and sides of the chest dingy grey; middle of the chest and under part of the body white; the head of the female is dingy grey.

M. Forficata, Cuv.; *Swallow-tailed Flyseeker*. Size of the Common Lark, and has the tail of equal length with the body, its outer quills the longest, and diminishing to the middle; head and back very light grey, with a reddish tinge; greater wing-coverts blackish, lesser

MUSCI-
PETA.

MUSCI-
PETA.

ashy, both edged with white; alar quills black with reddish edges; caudal quills velvet-black; under parts of the body white.

M. Ruficapilla, Cuv.; *Redheaded Flyseeker*. More than five and a half inches long; the head deep rufous; and upper parts of the body almost entirely reddish and brown; under parts longitudinally spotted with black and white. It lives permanently in Paraguay among the bushes, and is not shy.

M. Colon, Cuv.; *Planter's Flyseeker*. Five inches long; the middle two caudal quills extending three inches and a half further, have their middle barb-less, and their origin and tip furnished only with short webs; the other five on either side of equal length with each other, and webbed as usual; plumage almost entirely black. Never quit the great Forests of Paraguay, do not hide themselves, but hunt for insects among the higher branches of withered trees.

M. Cyanirostris, Cuv.; *Blue-beaked Flyseeker*. Nearly six inches long, the plumage black, and the beak blue. It may be observed flitting about the borders of woods, among the bushes in search of insects.

M. Nigricans, Cuv.; *Blackish Flyseeker*. Of similar size to the last; the head, neck, and back blackish; the throat and belly white; front of the neck and chest, sides and rump, spotted longitudinally with blackish and reddish-white; legs black.

M. Icterophrys, Cuv.; *Green and Yellow Flyseeker*. About six inches long; a yellow streak above each eye; upper parts of the body deep green, under parts bright yellow.

M. Punctata, Cuv.; *Dotted Flyseeker*. Body dotted with white; alar quills edged with green, their upper coverts with white, as also are the outer edges of the external caudal quills.

M. Varia, Cuv.; *Varied Flyseeker*. Head blackish, but when the feathers are raised, they are seen orange and white; upper parts of the body blackish; belly and under wing-coverts pale yellow; on the remaining under parts they are blackish in the centre with white edging on the front of the neck, and pale yellow elsewhere.

M. Rubra, Cuv.; *Red Flyseeker*. Body crimson, front of the neck reddish-white, chest and belly white, tinged with yellow.

M. Sibilator, Cuv.; *Hissing Flyseeker*. About seven inches long; top of the head black; upper part of the neck and the back brown in the middle, on the sides and the rump deep green; alar quills blackish with white edges; tail nearly black.

M. Phaenoleuca, Cuv.; *Yellow-crowned Flyseeker*. Principal part of the head and the tail black; on the head a yellow crown surrounded with white; back and upper parts brown; under white.

M. Psalura, Tem.; *Yetapa Flyseeker*. About five inches and three-quarters long; the feathers of the head have no webs, are rough and of a leaden colour, as also are the neck and chest; upon each ear is a spot of bright rust, which descends on the sides of the neck forming a kind of collar; back and upper wing-coverts blackish; alar and caudal quills brown and white intermingled, with a reddish spot on the wings. The tail of this bird is very long, and it possesses the remarkable property of being able to stop its flight suddenly by expanding the tail like the blades of a pair of scissors. It lives in small companies among the marshes, and utters a hissing note; it runs along the ground in search of worms and insects, on account of which habits it differs remarkably

in its habits from the genus among which Vieillot has placed it.

M. Melanops, Cuv.; *Black-eyed Flyseeker*. The male has a crest consisting of very long silk-like feathers; the sides and back of the head, and the upper part of the neck and body are brown; the under parts reddish-white. This bird is shy, and merely seen flying from one wood to another in Paraguay.

M. Caudacuta, Cuv.; *Narrow-tailed Flyseeker*. Little more than four inches long; top of the head blackish, streaked on the edges with brown; neck and back also blackish, the feathers of these parts edged with red; under parts golden-white mingled with red; beak and legs black.

Sect. IV. Oceanic Flyseekers.

M. Lutea, Cuv.; *Yellow Flyseeker*. About five and a half inches long. The general colour of the plumage ochrous-yellow, with a tinge of black on the wings and tail; beak leaden; legs ash with black claws.

M. Passerina, Cuv.; *Passerine Flyseeker*. Upper parts dingy black, under whitish.

M. Novæ Hollandiæ, Cuv.; *New Holland Flyseeker*. Seven inches long; brown above, white beneath; a yellow streak passes from the eye to the ear.

M. Caledonica, Cuv.; *Caledonian Flyseeker*. Six inches long; upper parts olive-green; under parts dingy white and yellow.

M. Nævia, Cuv.; *Wavy Flyseeker*. Eight and a half inches long; back waved with black and whitish; under parts white.

M. Flabellifera, Cuv.; *Fantailed Flyseeker*. Six and a half inches long; plumage mostly olive; about the neck a white collar; under parts of a rusty tinge inclining to white towards the lower part of the belly; tail wedge-shaped, its lateral quills white: it spreads its tail as it flies, and is so bold as to pursue the gnats even on people's heads. It is a native of New Zealand, and called by the natives *diggo wagh-wagh*.

M. Ochrocephala, Cuv.; *Yellow-headed Flyseeker*. Rather more than five inches long; the head, neck, and chest of a golden-yellow colour; upper parts of the body yellowish-green, except the rump, which is ash; under parts white.

M. Melanopsis, Cuv.; *Black-faced Flyseeker*. Six inches long; forehead and face velvet-black; front of the neck and upper part of the body deep grey; under parts bright red; beak greenish with a blue base. New South Wales.

M. Barbata, Cuv.; *Bearded Flyseeker*. Eight or nine inches long; almost the whole plumage pale green; from the corner of the mouth a black stripe passes above the eyes and behind the head where it is edged with yellow. New South Wales.

M. Pectoralis, Cuv.; *Pectoral Flyseeker*. Seven and a half inches long; general colour yellow; part of the head, the sides of the neck and chest black; throat and front of the neck white.

Dumeril doubts whether the *Djou*, or *Muscicapa Crepitans* of Latham, on account of its feeding principally on honey, and its pugnacious disposition, belongs to this genus.

See Linnæi *Systema Naturæ* a Gmelin; Vieillot, *Histoire Naturelle des plus beaux Oiseaux Chanteurs de la Zone Torride*; Temminck, *Manuel d'Ornithologie*, and *Planches Coloriées*; Latham, *General Synopsis of Birds*.

MUSCLE
—
MUSE.

MUSCLE, Fr. *muscle*; Sp. *musculo*; Lat. *musculus*, *ab similitudine aliquâ muris*. Vossius, *a tenui, quo mures referunt, strepitu*. Junius, who observes that *μύες* was the general denomination of shell-fish, ἀπὸ τοῦ μύειν, from their shutting themselves up.

Frydays and fastyng dayes ferthyngworth of *muscles*
Were a feste for suche a folk.

Piers Plouhman. Vision, p. 152.

A *muskel* in a blewe shell, had enclosed a margarite perle, the most precious, and best that euer tofore came in my sight.

Chaucer. The Testament of Loue, book i. p. 471.

The *mussel* often trimm'd
With orient pearl within, as thereby Nature show'd,
That she some secret good had on that shell bestow'd.

Drayton. Poly-olbion, song 25.

ESLIP. And here's a chain of whittings' eyes for pearls,
A *muscle-monger* would have made a better.

Beaumont and Fletcher. Rule a Wife and have a Wife, act iv. sc. 1.

MUSCLE, Fr. *muscle*; It. *muscolo*; Sp. *musculo*; Lat. *musculus*; Gr. *μῦς*; because it resembles a skinned mouse; or the fish so called. See **MUSCULARITY**, **MUSCULOUS**. Vossius. More probably from the Greek verb *μύειν*, to cover; because the *muscles* cover or clothe the bones. Cotgrave calls the Fr.

Muscle: the instrument of voluntary motion, compounded of sinews, veins, arteries, tendons, and flesh, and having a skin peculiar to itself.

And with fell tooth accustomed to blood,
Launched his thigh with so mischievous might
That it both bone and *muscles* ryved quight.

Spenser. Astrophel.

The tendinous (fibers) are parallel and direct between the two ends of a *muscle*. And upon these the far greater stress of the muscular action doth depend.

Grew. Cosmo Sacra, book i. ch. iv. sec. 14. fol. 19.

The guts of a sturgeon, taken out and cut to pieces, will still move, which may depend upon their great thickness and *muscularity*.

Id. Museum.

The uvous coat or iris of the eye hath a *muscular* power, and can dilate and contract that round hole in it, called the pupil or sight of the eye.

Ray. Of the Creation, part ii. p. 291.

And therefore almost the whole *muscular* flesh of the body is bestow'd upon the tail and back, and serves for the vibration of the tail, the heaviness and corpulency of the water, requiring a great force to divide it.

Id. Ib. part i. p. 176.

She [Sculpture] saw the head,
Breathing the hero, small, of Grecian size,
Scarce more extensive than the sinewy neck;
The spreading shoulders, *muscular* and broad.

Thomson. Liberty, part v.

[Isaac Fuller] understood the anatomic part of Painting, perhaps equal to Michael Angelo, following it so close, that he was very apt to make the *muscelling* too strong and prominent.

Walpole. Anecdotes of Painting vol. iii. ch. i. p. 7.

This part was very bad, and the colouring of the Saturn too raw, and his figure too *muscular*.

Id. Ib. p. 10.

MUSE, v. Fr. *muser*, *musard*; It. *musare*; in
MUSE, n. Dutch *muysen*. From Lat. *mussare*, or
MU'SARD, Gr. *μύζω*, from *μύειν*, *claudere*. Skinner.
MU'SER, It is more probably formed upon the
MU'SEFUL, noun *muse*, Lat. *musæ*: and intended
MU'SELESS, to denote (see **AMUSE**, and **MUSICK**)
MU'SING. To follow the *Muses*, to be contemplative or thoughtful, as one who follows the *Muses*; to meditate, dwell upon, keep the mind fixed or employed upon; to weigh, to ponder.

Musard, one who *muses* or spends his time in *mus-ing*; a dreamer.

Muse, the noun, is sometimes applied to the Poet.

Comen is þe Sarazin to speke with Sir Edward,
Clad in cloþes fyn, himself is a *mosard*.

R. Brunne, p. 229.

Desherite Edward of alle his seignorie,
Of Jon Baliol *musard* sulk was his courtesie.

Id. p. 266.

The more ich *muse* þer on. *mýstiloker* hil semeþ.

Piers Plouhman. Vision, p. 190.

Farisees hirden the puple *musyng* of hem thise thingis.

Wiclif. John, ch. vii.

And whanne he hadde seide these thingis iewes wenten out fro him and hadden mych questioun, either *musyng* among hemself.

Id. Dedis of Apostles, ch. xxviii.

For he *mused* so in the well,
That shortly the sooth to tell,
He lou'd his owne shadow so,
That at last he strafe for wo.

Chaucer. The Romant of the Rose, p. 182.

O lady mine, that called art Cleo,
Thou be my spede fro this forth, and my *Muse*,
To rime well this till I have do;
Me needeth here none other art to vse.

Id. Troilus and Creseide, book ii. p. 237.

All men hold thee for *musarde*.

Id. The Romant of the Rose, p. 200.

To *muse* in his philosophie
Sole without companie.

Gower. Conf. Am. book iii. p. 82.

As he laye *musyng* on a nyght
Of the tidinges, which he herde,
He thought assaie howe that it ferde.

Id. Ib. book viii. p. 252.

Sir, leave your *musyng* and come into y^e hall, if it please you, your dinner is all redy.

Lord Berners. Froissart. Cronycle, vol. i. ch. lxxvii. p. 99.

At this question, all the Lords sate sore astonied, *musyng* much by whom this question should be meant, of which euery man wist himselfe cleere.

Stow. Edward V. Anno 1483.

So may some gentle *Muse*
With lucky words favour my destin'd urn:
And, as he passes, turn
And bid fair peace be to my sable shroud.

Milton. Lycidas, v. 29.

And touching this matter, it is reported that the theater being full of people, Phocion walked all alone upon the scaffold where the players played, and was in great *muse* with himself: whereupon, one of his friends seeing him in one of his *muses*, said unto him, Surely Phocion thy mind is occupied about somewhat.

Sir Thomas North. Plutarch, fol. 624. Phocion.

It is to be wonder'd how *muselless* and unbookish they were, minding nought but the feats of war.

Milton. Works, vol. i. fol. 143. Of Unlicens'd Printing.

There flowry hill Hymettus, with the sound
Of bees' industrious murmur, oft invites
To studious *musyng*.

Id. Paradise Regained, book iv. l. 246.

The morning, we know, is commonly said to be a friend to the *Muses*, but a morning's draught is never so.

South. Sermons, vol. iv. p. 356.

Meanwhile, in *musical* mood
Absorpt in thought, on vengeance fix'd he stood.

Pope. Homer. Odyssey, book xviii.

Here Grief with holy *musings* may converse
In sounds, that best shall greet the glorious hero's herse.

Warton. Ode 10.

Then, Goddess, guide my pilgrim feet
Contemplation hoar to meet,
As slow he winds in *musical* mood,
Near the rush'd marge of Cherwell's flood.

Id. Ode 11.

MUSE.

MUSE.

Say, scenes of science, say, thou haunted stream,
(For oft my *Muse-led* steps didst thou behold)
How on thy banks I rifled every theme,
That Fancy fabled in her Age of gold.

Mason. *Elegy 3. To the Rev. Mr. Hurd.*

Hesiod.

The MUSES, as we learn from the *Theogony* of Hesiod, the eldest authority on such matters, dwell on Mount Helicon, where they dance round its dark fountain and the altar of Saturn, bathing in Permessus, or Hippocrene, or Olmeius. Flying abroad by night, and enveloped in clouds, they chant the praises of the Gods; and in one of those "visitings" they taught Hesiod himself his song, presenting him with a laurel branch, as Burns afterwards, in like manner, received a holly from his inspiring Genius. Concerning themselves they stated to the Ascræan Bard that they were in the habit of delighting Jupiter by their songs in his state at Olympus; where they related to him things past, present, and to come, amid the smiles and approbation of the attendant Deities. They drew their birth from a nine days' intercourse between Jupiter and Mnemosyne, Queen of Eleuther, a part of Bœotia, who in due season produced nine daughters in Pieria. Besides their customary abode on Helicon, they had a splendid Palace allotted for their residence on the summit of Olympus, in the immediate neighbourhood of Cupid and the Graces. Hesiod then gives their names in three memorial lines, from the last of which it appears that Calliope takes precedence of her sisters, and hence she is the *Regina Calliope* of Horace.

Κλειώτ', Εὐτέρπητι, Θάλιᾳτι, Μελπομένητι,
Τερψιχόρῃτι, Ἑρατώτι, Πολύμνιατ', Οὐρανίῃτι,
Καλλιόπῃ, ἥ δὲ προφειριστάτῃ ἴσθιν ἅπασάνων. (77.)

Clioque, Euterpeque, Thaliaque, Melpomeneque,
Terpsichoreque, Eratoque, Polymniaque, Uranique,
Calliopeque, illas inter quæ maxima Musa est.

Calliope is the assessor of Kings; and together with her Sisters she pours suavity of speech upon the lips of such Rulers as they delight to honour, so that their decisions are regarded with reverence. The Muses also are the solacers of human cares; and the old Poet has expressed himself on this point in glowing and melodious verse, sufficiently proving that he believed and acknowledged, and, as there can be little doubt, had satisfactorily experienced the truth of his assertion. Some of the commentators have been unwilling to leave Hesiod in full possession of this strain of higher mood, and have ascribed the lines to Homer. Their commencement is always printed in the short, and probably fragmental Hymn of the latter Bard *To the Muses and Apollo*.

ὃ δ' ὀλβιος ὕμνῳ Μῦσαι
φιλοῦνται· γλυκερὴ οἱ ἀπὸ στόματος ῥέει αὐδὴ.
εἰ γὰρ τις καὶ πένθος ἔχων νοσηδὶ θυμῷ
ἔζηται κραδίη ἀπαχήμενος, αὐτὰρ ἀοιδός,
Μουσῶν θεράπων, κλέῃα προτέρων ἀνθρώπων
ὑμνήσῃ, μάκαρές τε θεὸς οἱ Ὀλύμπῳ ἔχουσιν,
αἵ ψ' ὅγε δυσφρονέων ἐπιλήθεται, ἐδὲ τι κηδίων
μύμνηται, ταχὺς δὲ παρέτραπε δῶρα θεῶν. (96.)

Theocritus.

The sentiment of Hesiod, as may readily be supposed, became a favourite with later Poets, and it has been reechoed frequently, and in various forms. Even the Cyclops in Theocritus admits the power of the Muses as a sedative of the pangs of Love; for the Poet in his opening means no doubt to express the feelings of the one-eyed Lover.

ὣδ' ἐν ποσσὶν ἔρωτα πιφύκει φάρμακον ἄλλα,
νικίᾳ, ἔσ' ἔγχριστον ἱμοὶ δοκί, ἔσ' ἐπίπαστον,

ἢ καὶ Πιερίδης· κῦφον δὲ τι τῶτο καὶ ἀδὺ
γίνεται ἀνθρώποις.

MUSE.

Callimachus has condensed Hesiod's thought with unexampled beauty in the last distich of the Epitaph which probably was intended for his Father's monument. (*Epig.* 22.) After stating that the Son of Callimachus, who lies beneath, was the Father of another Callimachus, who *ἤειπεν κρείσσονα βασκανίης*, silenced even Envy by his Song, he adds,

Οὐ νέμισις, Μῦσαι γὰρ ὄσους ἴδον ὁμμάτι παῖδας
ἄχρ' εἰς πολὺς ἐκ ἀπείθιντο φίλους.

And the expansion of this idea by Horace in his noble Ode *Quem tu Melpomene semel*, must be familiar to every reader. It should be added, that Callimachus in another Epigram, cited by Natalis Comes, but which we do not find in the Poet's own Works, distributes to the several Muses by name the Arts over which they preside. He has been followed by Ausonius. (*Edyl.* 20.)

It has been remarked that Homer, when opening his Catalogue of the Grecian forces, invokes the Muses; because so numerous were the men of valour among his Countrymen, that memory, unless divinely assisted, could scarcely do them all full justice. When he reviews the Trojans, on the other hand, he contents himself with mere human powers, for Hector was almost the only hero whom he had to bring forward. It may be doubted whether this refined compliment is more than imaginary; but perhaps belief in it is strengthened by the few occasions in which the aid of the Muses is solicited afterwards; and the particular persons concerning whom it is required, viz. when the Poet is preparing to speak of the deeds of Agamemnon, (*Λ.* 218.) of other Greeks, (*Ξ.* 508.) and lastly of Hector when about to fire the fleet. (*Π.* 112.)

The origin of the general name of these Goddesses, Etymology. as implied by Theognis, may be traced to their spirit of inquiry and investigation.

Χρὴ Μουσῶν θεράποντα καὶ ἄγγελλον, εἴτι περισσὸν
εἰδίη σεφίης, μὴ φθονερὸν τελέειν,
ἀλλὰ τὰ μὲν ΜΩΣΘΑΙ, τὰ δὲ δεκνύσαι.

So also Plato, in *Cratylus*, p. 406. Plutarch, *de Fraterno amore*, gives ὁμοῦ οὔσαι, from their concord and agreement. Diodorus Siculus (*iv.* 7.) μνέω, from their power of initiating their votaries in the mysteries of knowledge. Others μαιῶσθαι, from their invention.

Apollodorus says little about these Ladies; we find in him a catalogue of their names, a mention of Mnemosyne as their mother, the priority of Calliope, a few of their adventures, and notwithstanding their reputed virginity, a register of their children; thus among the most illustrious, for of others we need scarcely take note, Orpheus was a son of Calliope. Clio became enamoured of a youth named Pierus, in consequence of the revenge of Venus, at whom she had sneered on account of her passion for Adonis. The issue of this Muse was Hyacinthus, a youth unhappy on more accounts than his premature death, if all that Apollodorus states concerning him be credited. Thamyras, one of his admirers, hazarded a contest with the Muses; the conditions of which were the love of each if he vanquished, the surrender of whatever they might please to deprive him if he were beaten; and he went away after the decision, without eyes and without his skill in harping. Rhesus, the victim of Diomedes's attachment to the turf, sprang from an amour between

Callimachus.

Homer.

Apollodorus.

Their children.

MUSE. Euterpe and the River Strymon, a point in which Euripides (*Rhesus*, 347.) agrees with Apollodorus, although Homer names Eioneus as the Father; (*Il.* K. 435.) the Corybantes from Thalia and Apollo; and the Sirens from Melpomene and Achelous. (*T.* 3.) So that Urania is the only one who preserved her maiden honour inviolate, or to speak more cautiously, who has not been detected in maternity. In another place, the same writer tells us that the Sphinx was taught her plaguy Riddle by the Muses, who might have been better employed than in promulgating it. The rash daring of Thamyris the Thracian is noticed by Homer. (*Il.* B. 595.) The scandal attaching to these Ladies of Parnassus has not escaped Juvenal, who sarcastically alludes to it,

*narrate Puella
Pierides; prosit mihi vos dixisse Puellas.* (iv. 35.)

Lucian. Strange to say, however, they have escaped scot free from Lucian, no great respecter of divine personages in general. In a Dialogue between Venus and Cupid, the Goddess asks him how it happens that he has never directed his shafts at the Muses; and he answers in terms very respectful to their reputation, but which, perhaps, the sly Satirist meant to be interpreted in modern parlance, that they are rather too *blue* for him: *αἰδοῦμαι αὐτάς, ὃ μήτηρ, σεμναὶ γὰρ εἰσὶ, καὶ ἀεί τι φροντίζουσι.*

Euripides. Euripides has sometimes been mistakingly supposed to affirm that Harmonia was the mother of the Muses, and that they were born in Attica; but the fine passage in the *Medea*, (827.) upon which the notion rests, probably means no more than that they were brought into Attica to be *educated* by Harmonia. Musgrave, indeed, denies that *φύγεῖν*, the word employed by the Poet, is ever used otherwise than in the sense *gignendi*; but even if this were clear, it may be remarked that Euripides is speaking of Athens when he says that *there* (*ἐνθά*) Harmonia, &c. the *εννέα Πιερίδες*. Now if he had supposed the Muses to have been born in Attica he never would have called them *Pierides*; and if they were born in Pieria, Harmonia could not have been their mother in Attica; *φύγεῖν*, therefore, most probably is used in a peculiar sense.

Diodorus Siculus. Most writers of approved authority, says Diodorus Siculus, call the Muses daughters of Jove and Mnemosyne; a few of the Poets, among whom is Alcman, speak of Cœlum and Terra as their parents. There is like dissension about their number; some count three, others, far more to be trusted, nine. He then presents some dull and sufficiently obvious derivations of their several names.

Plutarch. Plutarch, in his *Symposiaca*, has a long Chapter (viii. 14.) on the question why the Muses are nine in number. To the suggestion of one of his interlocutors, Herodes, of the abstract fitness of that number, on two very fanciful accounts, first as being the square of the first uneven number, and secondly as being unevenly uneven, *i. e.* itself an uneven number, and divisible into three equal uneven numbers, Ammonius replies with a smile, that he might add because of the composition of the number 9 from two cubes, 1 and 8; or from two triangles, 3 and 6, but that such a reason bears no more upon the Muses than upon other Deities who are *not* nine. It might, therefore, be almost equally sound reasoning to pronounce that they are nine, because there are nine letters in the name of their mother M, n, e, m, o, s, y, n, e. Ammonius next observes that the Ancients had no more than three Muses, not because there are

only three Musical modes, the diatonic, the chromatic, and the enharmonic; nor because there are three Musical intervals, *netè*, *mesè*, and *hypatè*; but because there are three chief genera of Knowledge, namely, Philosophy, Oratory, and Mathematics. In the time of Hesiod, further ramifications had taken place, and he therefore extended the number of presiding Goddesses according to the triple subdivision which the three leading heads admitted. Thus Mathematics included Music, Arithmetic, and Geometry; Philosophy, Ratiocination, Morals, and Physics; and Oratory, the Arts of the Rhetorician, (*τὸ ἐγκωμιαστικὸν*), of the Counsellor, (*συμβουλευτικὸν*), and of the Judge: (*δικανικὸν*;) and this trifling continues much in the same strain to the end of the Chapter.

Cicero notices three distinct Families of Muses, four born from the eldest Jupiter, Thelxiopè, Aædè, Archè, and Meletè; the nine which are most commonly known, from the third Jupiter and Mnemosyne; and nine more also with the same names (who therefore are altogether supererogatory) from Pierus and Antiopa. (*De Nat. Deorum*, iii. 21.) Hyginus, in the Preface to his Fables, speaks of a mother, who, till our own days, has not often been considered by common fame to stand in the relation of grandmother to the sons of the Muses, namely Moneta. The same writer makes them umpires of the contest between Apollo and Marsyas. (*Fab.* 165.)

Pausanias dwells longer than is his general custom upon the history of the Muses. Ephialtes and Otus are said to have been the first who consecrated Helicon to them, and offered sacrifices to their divinity; but those primitive worshippers acknowledged no more than three, Meletè, Mnemè, and Aædè; that is to say, Thought, Memory, and Song. Pierus the Macedonian increased the number to nine, whether from his own discretion, or from the warning of an Oracle, or from obedience to the discipline of the Thracians, who were more skilled in Religious lore than the Macedonians, is not certain. Some think (we believe Aristotle is of the number in his *Tract de Choris*, iii.) that Pierus had nine daughters, named respectively after the Muses, and that it is from the children of those Pierides (lawfully begotten) that the reputation of the maiden damsels of Castaly has unjustly suffered. On Helicon stood a marble statue of Euphemè, the nurse of the Muses. (ix. 29.)

Among the Moderns, Spenser, a great innovator on received Mythology, has twice named Apollo and Mnemosyne as parents of the Muses; although in other places he has adopted their most commonly acknowledged descent.

MUSET, Steevens refers to the Fr. *trouée*, in Cotgrave, "A gap or *muset* in a hedge."

The many *musits* through the which he goes,
And like a labyrinth to amaze his foes.

Shakspeare. *Venus and Adonis.*

MUSEUM, Gr. *μουσεῖον*, a place dedicated to the Muses, to Literature, to Philosophy; to the preservation of rare and curious articles.

Of *museums*, galleries of paintings and statues, public libraries, &c. I need only say that they exist in almost every town in Italy, and open an ample field to the exercise of observation and curiosity.

Eustace. *Italy*, vol. i. p. 66. *Preliminary Discourse.*

MUSHROOM, Fr. *mouscheron*. Salmasius thinks they are so called a *musco*, because they grow *ubi brevissima est herba, et plerumque nonnisi muscus*, where

Alle pe musons in musyk. ich made hure to knowe.

Piers Plouhman. *Vision*, p. 189.

For the armony
And sweet accord was so good musike,
That the uoice to angels most was like.

Chaucer. *The Flower and the Leaf*, p. 395.

And of musike also the note
In man's voyce or softe or sharpe,
That fonde Juball.

Gower. *Conf. Am.* book iv. p. 113.

And she, more sweet then any bird on bough
Would oftentimes amongst them bear a part,
And strive to passe (as she could well enough)
Their native musicke by her skilful art.

Spenser. *Faerie Queene*, book ii. can. 6.

Therein the merry birds of everye sorte
Chaunted aloud their chearefull harmonie,
And made amongst themselves a sweete consort,
That quickned the dull spright with musical comfort. Id. *Ib.* book ii. can. 5.

The sweet lip'd sisters musically frighted,
Singing their fears, are fearfully delighted.

Crashaw. *Music's Duel*.

And I thinke
The nightingale if she should sing by day
When every goose is cackling, would be thought
No better a musitian then the wren?

Shakspeare. *Merchant of Venice*, fol. 183.

She said;—in air the trembling music floats,
And on the winds triumphant swell the notes:
So soft, though high, so loud, and yet so clear,
Ev'n listening angels lean from heaven to hear.

Pope. *The Temple of Fame*.

How soft the music of those village bells,
Falling at intervals upon the ear
In cadence sweet, now dying all away,
Now pealing loud again and louder still,
Clear and sonorous, as the gale comes on!

Cowper. *The Task*, book vi.

Thine too those musically falling founts,
To slake the clammy lip.

Dyer. *Ruins of Rome*.

The peculiar musicalness of the first of these lines, in particular, arises principally from its consisting entirely of iambic feet.

Dr. Warton. *Essay on Pope*.

The name of the *Muses*, and universally that of *music*, was derived, as it seems, from *μῦσθαι*, to enquire, and from investigation and philosophy.

Taylor. *The Cratylus of Plato*, p. 60.

MUSK, } Fr. *musc*; It. *muschio*; Low Lat. *mus-*
MU'SKY. } *cus*; in Arabic *mosch*, or *musch*. The word is applied to a perfumed substance said to be obtained from an animal of the same name. *Musky*,

Sweetly scented, or perfumed, sweetly odoriferous, **MUSK.**

Their vessels of yuory comprehendeth al their combes, their muske balles, their pomander pottes, &c. **MUSKET.**

Bale. *Image of bothe Churches*, part iii.

And yet, as Paracelsus encourageth, ordure makes the best musk, and from the most fetid substances may be drawn the most odoriferous essences.

Sir Thomas Brown. *Vulgar Errours*, book iii. ch. xxvi. p. 216.

And though the problem of Aristotle enquire why none smells sweet beside the parde? yet later discoveries add divers sorts of monkeys, the civit cat and gazela, from which our musk proceedeth. Id. *Ib.* book iv. ch. x. p. 253.

There eternal Summer dwells,
And West winds, with musky wing,
About the cedarn alleys fling
Nard and cassia's balmy smells.

Milton. *Comus*, l. 989.

The glowing violet,
The musk-rose and the well attir'd woodbine,
With cowslips wan that hang their pensive head,
And every flower that sad embroidery wears.

Id. *Lycidas*, l. 146.

Jove! what a coyle these muske-wormes take to, to purchase another's delight? for, themselves, who bear the odours, have ever the least sense of them.

Ben Jonson. *Cynthia's Revels*, act v. sc. 4.

Nor this part musk or civet can we call,
Nor amber, but a rich result of all;
So she was all a sweet, whose every part,
In due proportion mix'd, proclaim'd the maker's art.

Dryden. *Eleonora*.

Thee April blithe as long of yore
Bermuda's lawns he frolick'd o'er
With musky, nectar-trickling wing,
(In the new world's first dawning spring)
To gather balm of choicest dew.

Warton. *Ode 11*.

MU'SKET, } Fr. *mosquet*; It. *moschetto*; Sp.
MUSKETE'ER, } *mosquete*.
MUSKETO'ON. } A very small species of hawk was so called, from *moschetto*, a little fly, or a troublesome stinging fly, as Warburton expresses it. And a musket (or small gun) is supposed to be a further consequential usage.

Some shall stop muskets, and so kill a foe.

Donne. *Upon Mr. Thomas Coryat's Crudities*.

He will never come within the signe of it, the sight of a cassock, or a musket-rest againe.

Ben Jonson. *Every Man in his Humour*, act ii. sc. 5.

* Colonel Thomas Morgan; whose veteran troops were the first perfect harquebusiers of our nation, and the first who taught us to like the musket.

Oldys. *Life of Sir Walter Raleigh*, fol. 12.

Raleigh leaving his gally, took eight musketiers in his barge, and with Gifford and Calfield in their wherries, having eight musketiers more, enter'd the mouth of that river. Id. *Ib.* fol. 80.

Quoth he, "My head's not made of brass,
As Friar Bacon's noddle was;
Nor like the Indian's skull so tough,
That, authors say, 'twas musket proof."

Butler. *Hudibras*, part ii. can. 1.

And into pikes and musqueteers
Stamp beakers, cups, and porringers?

Id. *Ib.* part i. can. 1.

One of them ventur'd upon him (as he was going to church, accompanied with the chief magistracy,) and shot him with a musketoon dead in the place.

Wood. *Athenæ Oxonienses*, vol. ii. fol. 338.

MUSKETS do not appear to have been in general good repute with the English Military writers of the XVIIth century. Sir Roger Williams, who published his *Briefe Discourse of War* in 1590, states indeed, that they are "the best small shot that ever were invented;" and

MUSKET. that 500 Muskets are better than 1000 Calivers; few armours being of sufficient proof to resist them at 10 or 12 score yards. His contemporary, Sir John Smythe, in his *Instructions, Observations, and Orders Mylitarie*, differs widely from the above judgment. "The Mosquetiers," he says, should be ordered "to charge their Mosquets with 5 or 6 round hailshot of war, of the heighth of Reistre's pistol bullets, which are called by the Spaniards *Perdigones de guerra*; (partridge-shot of war;) and that they do thrust between the powder and the haileshot some convenient quantity of brown or soft paper, or something else to restraine and keep the powder close together, and then to put in the round haileshot of warre, and againe to thrust after the same a convenient quantity of browne paper, or something else to keep the haileshot close together, and to restraine both powder and shot; in such sort as therby the powder may carry the haileshot the further, and give the greater blow, which within 10, 15, or 20 paces is of great effect. But in this case the Mosquetiers must take great heed that they do not overcharge their peeces with powder, nor with above the number of 5 or 6 haileshot of warre at the most, as aforesaid; least that their peeces should break or recoile, and so overthrow them to the trouble of the piquers from under whose piques they are to discharge their peeces;" taking especial care "so as they give no volee at the enemy above 20 paces at the furthest." (30.) The same writer afterwards contends, that 1500 archers would readily break 3000 Musketeers, if the trial were made in an open and plain field; for that the Musketeers, "if they meane to worke any effect, of necessitie must stand still to discharge their peeces, during which time of their standing still they shall, to their great error and mischiefe receive the continuall volees of the archers arrowes upon all parts of their bodies, in such sort as the archers, there is no doubt, being well instructed and led in their troupes by their Captaines and other officers, would, with great facilitie, with a verie few volees of arrowes breake all the Mosquetiers, although they were of a far greater number. For although Mosquets will carrie their bullets point and blanke a great deale further distance then archers are able to work any effect with their arrowes, yet their wonderfull uncertenties are such and so manie, as against archers, reduced into great numbers of troops, and assailing them in motion with infinite volees of arrowes, they would be found to be of a wonderful and incredible small resistance against the blows of such innumerable arrowes as aforesaid." (155.)

The excellent Knight then recommends that "Mosquetiers be elected of such men as are of good force and strength of bodie, although they were but of meane stature,"—"in respect of the heaviness of their weapons and furniture,"—"and I would wish that they should be everie waies apparallled, and that they should weare theyr swords in strong girdles, without any daggers, and that they should be armed with the like morrions to the harquebuziers before mentioned." These morrions are not the least important portion of their attire; they are to be "upright or sharp, fast tied with a red scarf under their chins after the Spanish fashion, all white and graven, or at least white ungraven, and in no wise any black morrions, because that the white doth beutifie the soldiers more, and is of greater terror in the eie and sight of the Enemy."

Harquebuziers, no less than Archers, are preferred by the same authority to Musketeers, on account of the

VOL. XXV.

heaviness of the piece used by the latter, which often "overmaistring his forces, doth make him to shoot just either at the centre of the Earth, or else at the seven stars, without doing any hurt to the enemy. Besides that when he hath once or twice discharged, to recharge againe, it doth not onlie, through the great length and heaveth of his peece, require a much longer time then for a harquebuzier to recharge his harquebuz, but also doth so weary the Mosquetier, that it doth bereave him of his forces, in such sort as he is to work in a manner no effect other than by his seldom discharging, to make a great noise." (157.)

The unwieldiness of this most cumbrous weapon when first employed with a matchlock and rest, may be well perceived in the *Wapen Handelinghe* of Jacob de Geyn, published in French, German, Dutch, and English, in 1619. Each of the movements in the Musket exercise is explained at large, and illustrated with a well-executed figure; and of these movements there are no less than forty-three! We may content ourselves with one instruction, that of "Give fire." "Here he shall present well, and hold the Musket and the rest in the left hand, bearing the right arme or elbow somewhat up, and turning a little the body to the left side, the left knee bowed and the right legge straight, and this not onely for fashion's sake, but also that the Musket may be hold (held) and shoot off the surer. Besides must be regarded, that when he will present, he set the Musket hard, not against the shoulder, but against the brest, for it is so more gracefull; besides, he shall not laye his cheeke to the stocke before he have set the Musket to his brest, because it hath other wayes no grace, much less can he shoote surely, but to the contrarie, for the most part slubbers it over in haste."

Sir John Smythe renews his attack in his *Discourses*, and informs us that Muskets were first used in Italy about the year 1530, "as I have divers times heard auncient Captaines of the Italian and Spanish Nations say, and that at that time they were employed for the defence of places fortified, as also out of trenches against places fortified being besieged; which were very natural places, and of greatest effect for that weapon. Howbeit since that time they have been used in most armies in the field, both on horsebacke and on foote, but chieflie on foote; but never in anie great number untill the Duke of Alva came to governe the Lowe Countries, who greatlie encreased the number of that weapon for soldiers on foote. To the which encrease of Mosquetiers he long before had perswaded with the Emperor Charles; howbeit he could never bring it to passe, because there were divers great and notable Captaines, such as the Marquesse of Guast, Don Fernando Gonzaga, Juan Baptista Castaldo, Antonio Dorea, and the Marquesse of Marinan, with divers other principal men of his Councell of Warre, that did utterlie mislike the encrease of that weapon for the field, as too burdensome and heavie for soldiers to use in battailes or great encounters; but for within tounes besieged, or out of trenches against places fortified, they did greatlie allow of them. (13.) The Spaniards accordingly were long reckoned the most skilful Musketeers in Europe, never however shooting at more than 8 or 10 score." The defects of the Musket, continues Sir John Smythe, are, that if the soldiers "in taking their sight doo faile butt the length of a wheate corne in the heighth of their point and blanke, they worke none effect at the marks that they shoote at, although they be verie great." The Muskets "also

MUSKET. being discharged but 7 or 8 shootes in hast, doo growe hote, and then doo worke small effect but daunger o the soldiers that doo occupie them." The powder moreover, if ill corned, "furreth the peeces and carrieth the bullet poynt and blanke but a little way, and many times goe not off at all." The match also frequently "giveth no fire to the touch powder." Unless the mouth of the piece be kept elevated the bullet often falls out; "whereupon it happeneth that many Mosquetiers, thrusting nothing after their bullets to keep them close to the powder, doe in vain discharge the powder without the bullets." The pieces also require a very troublesome attention to cleanliness. Moreover, in the field few Musketeers can be prevailed upon to use wadding, so that they "doo discharge much of the powder whole out of their peeces unfired, unless the powder be marvellous dry and good." "Besides all which defaults and defects the Mosquet in wet weather in the field does not work any effect." "All which so many imperfections of Mosquetiers as are before declared, with manie others that I omit, are the causes that upon manie great skirmishes and encounters that have been verie hot, and continued manie houres with new supplies on everie side, it hath often happened that in discharging on both sides manie thousand bullets, within 3, 4, or 5 scores and neerer, there hath not been on both sides slaine and hurt with bullets thirtie men; which greatlie argueth the insufficiencie of these kinds of weapons for batailles and great encounters."

Notwithstanding these pointed strictures, the Musket, as is well known, has become the chief weapon of modern infantry. Grose informs us, on the authority of Sir Thomas Kellie, in his *Art Militaire*, 1621, that the barrel of a Musket in those days was four feet in length, and the bore capable of receiving bullets twelve to the pound. The Rests, for the pieces were too heavy to be used without them, were carried on a march in the right hand, or hung upon it by a loop. Sometimes these Rests were armed with a tuck, (called a swine's feather,) which issuing from the head, if the Musketeers were in line, acted as a bayonet, and protected the front against cavalry like a palisade. The powder was carried in small wooden, tin, or leather boxes, each containing one charge; twelve of which, fixed to a belt worn over the left shoulder, were called *bandileers*; and to prevent the burning matches from being seen in the night they were carried in small metallic tubes pierced with numerous holes; from these tubes were derived the match boxes till within a few years worn by the English Grenadiers. The match was often carried lighted between the head and the crown of the hat, or in the pocket; and it is no matter of surprise, therefore, that it often

lighted his bandalier,
And woefully scorched the hacbutteer.

The cost of a Musketeer's equipment in 7th Charles I. was made out, as below, by a Council of War.

	s.	d.
For a new Musket, with mould, worm, and scowrer.....	15	6
For a Musket rest	0	10
For a new Bandalier with twelve charges, a primer, a priming-wire, a bullet-bag, and a strap, or belt, of two inches in breadth	2	6

MUSLIN, Fr. *mousselin*; so called from a town in Mesopotamia named *Moussul*, where Muslin was first manufactured.

In half-whipt *muslin* needles useless lie,
And shuttle-cocks across the counter fly.

Gay. *Trivia*, book ii. l. 339.

MUSOPHAGA, from *musa*, a banana, and *phagw*, I eat, Isert; *Banana Eater*. In *Zoology*, a genus of animals belonging to the order *Scansores*, class *Aves*.

Generic character. Beak short, strong, and wide; its ridge elevated, often very highly, always arched, and notched at the point; extremity of the lower mandible angular; nostrils basal, close to the ridge of the beak, partly closed by a horny substance, often covered and hidden by the frontal feathers; legs strong, tarsus as long as the middle toe; lateral toes of equal length, the outer reversible, all three connected by a rudimental membrane at the base; first three alar quills graduated, the fourth and fifth longest.

The birds forming this genus were divided into two genera by Illiger, under the names *Corythaix* and *Musophaga*, and this arrangement has been followed by Vieillot (who has substituted the title *Opæthus* instead of the former) and by Cuvier. The distinction stated to exist between the two consists in the beak of the *Musophagæ* forming a disc covering part of the forehead, which does not exist in the *Corythaices*, whilst their head is crested, which is not the case with the *Musophagæ*. According to Vieillot the beak of the latter is thicker, slightly triangular at the base, carinated above, slightly inclined at the tip, and the nostrils completely bare and uncovered by feathers. Temminck, however, includes all under the single genus *Musophaga*, and the variation cannot be so great as Vieillot imagines, since Cuvier, though dividing the genus like Vieillot, places in one genus some of the species enumerated by the latter author in the other.

All the *Banana Eaters*, which have in one instance been improperly called *Plantain Eaters*, belong to Africa, and feed on the two species of Banana, *Musa Paradisica* and *Sapientum*; they fly sluggishly, and move their wings very frequently without making much progress; but they vault from branch to branch of the forest trees, among which they live, with great agility, and run up their trunks with much quickness. They build in hollow trees; both male and female participate in the process of hatching, and their young ones follow them a considerable time.

M. Persa, Tem.; *Cuculus Persus*, Lin.; *le Touraco de Guinée*, Buff.; *Cape Banana Eater*. About the size of a Woodpecker; general colour grass-green; two white streaks enclose the eye; the crest green tipped with white, and disposed in a fanlike shape similar to that of the Manakins; (*Pipra*;) alar quills bright red; beak dusky red; legs and feet cinereous. Found in the neighbourhood of the Cape of Good Hope. It is of a lively and inquisitive disposition, following Man without fear, and hopping from branch to branch, at the same time uttering a cheerful cry. It builds in hollow trees, and lays four eggs of a bluish-white colour.

M. Buffoni, Tem.; *le Touraco Buffon*, Vieill.; *Buffon's Banana Eater*. Above each eye a black spot, crest tufted and inclined backwards; upper part of the back, under part of the body, green; wings, rump, and tail violet-blue. From Africa, but from what part is not known.

M. Paulina, Tem.; *Opæthus Erythrolophus*, Vieill.;

MUSLIN.
MUSOPHAGA.

MUSO-
PHAGA.
—
MUSS.

Pauline Banana Eater. The crest bright red tipped with white; cheeks white; general colour bright green, deeper on the body and tail, lighter on the belly, middle alar quills bright red, those on the outer edge violet; beak yellow; legs ash. From Southern Africa; it is often brought alive to Europe.

M. Violacea, Lath.; *le Touraco Violet ou Masqué*, Le Vaill.; *Violet Banana Eater*. About eighteen inches long, one-third of which belongs to the tail; the beak extends to the top of the head, forming a kind of mask, the upper part of which, however, according to Latham, is not attached to the skull, and in Le Vaillant's plate is surrounded with short hairs directed forwards; it is of a yellow colour, and the base of both mandibles covered by a naked skin or broad red caruncle, which occupies the place of the lore, and reaches behind the eyes; but in Latham's figure these parts are covered with feathers. The head is not crested, but covered with short, close feathers, which descend along the nape, and, like the rest of the body, are violet, glossed with purple, except the alar quills, which are crimson; the tail is long and cuneiform; the legs and claws black-brown. From Guinea and Senegal.

M. Gigantea, Vieill.; *le Touraco Géant*, Le Vaill.; *Gigantic Banana Eater*. About twenty-five inches long; beak strongly toothed and orange coloured; it has a fine black crest glossed with blue, and capable of elevation; cheeks, back of the head, neck, shoulders, and other upper parts very brilliant blue; chest yellowish-green; belly, femoral and anal feathers cinnamon; alar quills deep black at their tips; caudal black at their origin, ferruginous in the centre, and black at their tips; legs, toes, and nails black. Lesson considers the species described by Vieillot as the *M. Cristata*, to be identical with this.

M. Variegata, Vieill.; *Phasianus Africanus*, Lath.; *le Touraco huppé col*, Le Vaill.; *Variegated Banana Eater*. Eighteen inches long; ocular circlet feathered; beak black; crest but indistinct, placed on the back of the neck like a mane, consisting of long, narrow, very delicate, blackish-brown feathers edged with white; the head and neck, to the chest, chestnut-brown; upper part of the back and scapulars ashy-grey, with a longitudinal streak down the centre of each feather; alar quills black and white; under parts white, and each feather streaked with black; caudal quills slaty-grey, tipped with black; legs, toes, and nails black. In the female the colours are not so vivid. From Senegal.

See Vieillot, *Analyse d'Ornithologie*; Temminck, *Manuel d'Ornithologie*; Cuvier, *Règne Animal*; Latham, *General Synopsis of Birds*.

MUSS, Fr. *mousse*; the play called *musse*. Mr. Nares observes, that *musse* is one of Garagantua's Games, book i. c. xxi.; and is mentioned again, iii. 40. "*a Muscho inventore*." In our Poets it is used as equivalent to

A scramble.

Authority melts me of late. When I cried, ho,
Like boyes unto a *musse*, kings would start forth,
And cry, "your will."

Shakspeare. *Anthony and Cleopatra*, fol. 357.

Cos. Buy any peares, very fine peares, peares fine.

(Nightingale sets his foote afore him, and he falls with his basket.)

Cox. Gods so! a *musse*, a *musse*, a *musse*, a *musse*.

(Cokes falls a scrambling, &c.)

Ben Jonson. *Bartholomew Fayre*, act iv. sc. 2.

Bauble and cap no sooner are thrown down,
But there's a *muss* of more than half the town.

Dryden. *Prologue to the Widow Ranter*. (By Mrs. Behn, 1690.)

MUSSÆNDA, in *Botany*, a genus of the class *Pentandria*, order *Monogynia*, natural order *Rubiaceæ*. Generic character: corolla funnel-shaped, stigmas two, rather thick; berry oblong, two-celled, many-seeded; seeds in four sets, stamens inserted into the inside of the tube of the corolla.

Two species, natives of the East Indies.

MUSSINIA, in *Botany*, a genus of the class *Syngenesia*, order *Frustranea*. Generic character: calyx simple, many-leaved, cylindrical, toothed; petals of the radius strap-shaped; receptacle villose; down pilose.

Six species, natives of the South of Africa.

MUST, anciently written *mote*, *moste*; A. S. *mot*, *most*; Ger. *mussen*; D. *moeten*, *moetten*. The old Eng. *mote*; A. S. *mot*; Ger. *mussen*, were used as we now use both *may*, and *must*, (*posse*, *oportere*, *necessè esse*.) and are of the same origin as *mought*, *mote*, *q. v.*

To be behoveful, needful, necessary: to be bound or obliged; to be under a necessity.

"We *mote*," he sayde, "be hardy, & stal worþe, & wyse,
gef we wol habboure lyf, and holdeoure franchise."

R. Gloucester, p. 155.

For if I preche the gospel glorie is not to me, for nedeliche I
mote doon it; for wo to me if I preche not the gospel.

Wiclif. 1 *Corinthians*, ch. ix.

For this ye knowen al so wel as I,
Who so shall telle a tale after a man,
He *moste* reherse, as neighe as ever he can.

Chaucer. *The Knightes Tale*, v. 734.

On of us two *most* bowen doutelees:
And sith a man is more resonable
Than woman is, ye *mosten* ben suffrable.

Id. *The Wif of Bathes Tale*, v. 6024.

Wherefore they *musten* of necessitee,
As for that night departen companie.

Chaucer. *The Nonnes Preestes Tale*, v. 14998.

As ever *mote* I drinken win or ale,
Who so is rebel to my judgement,
Shal pay for alle that by the way is spent.

Id. *The Knightes Tale*, v. 834.

This open thyng whiche is befall
Concludeth hym by such a wey,
That he the faith *moste* nedes obey.

Gower. *Conf. Am.* book ii. p. 50.

The *must* three times together; I wear as sharp steel as another
man, and my fox bites as deep, *musted*, my dear brother.

Beaumont and Fletcher. *A King, and no King*.

Much thou hast yet to see, but I perceive
Thy mortal sight to faile; objects divine
Must needs impaire the wearie human sense.

Milton. *Paradise Lost*, book xii. l. 10.

Of systems possible, if 'tis confest
That wisdom infinite *must* form the best,
Where all *must* fall or not coherent be,
And all that rises, rise in due degree;
Then, in the scale of reasoning life, 'tis plain,
There *must* be, somewhere, such a rank as man.

Pope. *Essay on Man*, ep. 1. l. 45.

Where then shall Hope and Fear their objects find?

Must dull suspense corrupt the stagnant mind?

Must helpless man, in ignorance sedate,

Roll darkling down the torrent of his fate?

Must no dislike alarm, no wishes rise,

No cries invoke the mercies of the skies?

Johnson. *The Vanity of Human Wishes*.

MUST, Fr. *mouste*; It. and Sp. *mosto*; Lat. *mustum*; Gr. *μόσχος*, young, new. *Mustum* is applied

MUSS.
—
MUST.

MUST. to any thing, not wine merely, *new*. *Must*, in English,
to
MUS-
TELA. New wine, or other fermented liquor, in its uncleansed
state.

And othere scorniden, and seiden for these men been full of *must*.
Wiclif. The Dedis of Apostlis.

As touching *musts* or new wines, the first and principall difference
of them lyeth in this, That some by nature are white, others
blacke, and others againe of a mixt colour between them both.

Holland. Plinie, book xxiii. ch. i.

The *must*, of pallid hue, declares the soil
Devoid of spirit; wretched he, that quaffs
Such wheyish liquors; oft with colic pangs,
With pungent colic pangs distress'd he'll roar,
And toss, and turn, and curse th' unwholsome draught.
J. Philips. Cider, book i.

MUST, v. } From the Fr. *moiser*; Lat. *mucere*.
MU'STY, } To be or become foul, by confine-
MU'STINESS. } ment from air, or by disuse; to be or
become fusty, stale, stagnant.

Whē his wordes be wel sifted, men shall find little fine flowre in
thē, but all very *mustie* branne, not worthie so muche as to fede
either horse or hogges.

*Sir Thomas More. Workes, fol. 694. The Second Part of the
Confutation of Tyndall.*

Pistachoes, so they be good, and not *musty* joyned with almonds
in almond milk; are an excellent nourisher.

Bacon. Natural History, Cent. i. sec. 50.

PETIL. Any mirth,
And any way, of any subject, Junius,
Is better than unmanly *mustiness*.
Beaumont and Fletcher. Bonduca, act i. sc. 1.

Then he thinks of Parnassus, and Helicon streams,
And of old *musty* bards mumbles over their names;
Talks much to himself of one Phœbus Apollo,
And a parcel of folk that in 's retinue follow.

Byrom. The Poetaster.

MUSTA'CHE, } Fr. *moustache*; It. *mostacchio*;
MUSTA'CHIO. } Sp. *mostacho*; from Gr. *μύσταξ*,
the upper lip, and hair growing upon it.
The hair or beard grown upon the upper lip.

Your braue *mustachyos* turnde the Turkey waye.

Gascoigne. Councell to Master Bartholomew Withipoll.

They not over-wise brought word that the duke's army were most
of them priests; for they saw their faces all over shaven; the
English then using to let grow on their upper lip large *mustachios*,
as did anciently the Britons.

Milton. Works, vol. ii. fol. 120. The History of England, book iv.

MUSTARD, Fr. *moustarde*; It. *mostardo*; Sp.
mostaza; a *musto et ardore*. J. Scaliger. See Menage,

MUSTELA, Lin., Illig., Tem.; *Polecat, Weasel*,
Marten, Pen. In Zoology, a genus of animals belong-
ing to the tribe *Digitigrada*, family *Carnivora*, order
Sarcophaga, class *Mammalia*.

Generic character. Incisive teeth six in each jaw;
the second lower outer one narrower, and set further in
than the others, cuspid, sharp, conical, and large; molar
in the upper jaw on each side four or five, of which the
anterior two or three are sectorial and slightly conical,
the last but one the largest, sectorial, tricuspid on the
outer edge, and on the inner having a little distinct tu-
bercle; the last a transverse, tubercular grinder; in the
lower jaw five or six, the first small and deciduous, the
following two or three sectorial and conoid, the last but
one the largest, sectorial, and tricuspid, the last point
being very little elevated and increased by a little poste-
rior process, the last a small, circular, tubercular grinder.

The animals which compose this genus are distin-
guished from all other of the Carnivorous Family by the
length and slenderness of their bodies and the shortness
of their legs; their neck is extremely strong and thick,
nearly equalling that of the head; their body and
limbs are extremely supple, so that they twist about like
worms, whence they are called *Vermiform Animals*, and
insinuate themselves into extremely narrow holes in
search of their prey. They walk on the tips of their
toes, climb walls and trees by means of their sharp claws,
and when endeavouring to escape pursuit, fly with the
swiftness of an arrow by long leaps. All have anal
glands, the secretion from which, in the *Polecat, Weasel*,
and others, is extremely offensive, whilst in some, as
the *Marten* and *Pine Marten*, it affords an agreeable

perfume. They live a solitary life, some in the neigh-
bourhood of human habitations, others only in forests,
or near the brinks of streams. All of them are extremely
sanguinary, as they will often destroy much more
than they can eat, for the mere purpose of sucking
blood, which they prefer to the flesh. They steal upon
their prey when at repose, dart upon it with great quick-
ness, and fastening with their sharp teeth, remain firmly
attached, and are carried away with the animal, if suffi-
ciently strong to be capable of dragging away its tor-
mentor, (as the hare will do when seized by a *Weasel*,)
and will not leave it, till the blood is completely
drained.

The genus, as arranged by Linnæus, contained a vast
number of animals differing not only in habits, but also
in many important organic points; thus he included the
Otters of Storr, the *Skunks* of Cuvier, together with the
other individuals contained in the genus of *Weasels* now
to be described; which has been further divided into
two by Cuvier, the *Weasels*, *Putorius*, and the *Martens*,
Mustela; from the circumstance of the latter having two
molar teeth more in each jaw, and the true carnivorous
molar of the lower jaw having an additional little tu-
bercle on its inner edge, which, he states, indicate a
diminution in the ferocity of their disposition. The di-
vision, however, seems rather arbitrary, and therefore,
with Illiger and Temminck, they will be here described
as a single genus, merely dividing them, from this cir-
cumstance, into two sections.

They are found in all parts of the world, but more
especially in the temperate and colder Northern regions,
where their fur becomes extremely fine and thick, and in

MUST.

Norway and Siberia forms an extensive article of commerce.

Sect. I. *Putorii*.—Polecats or Weasels.

Carnivorous molar without an internal tubercle; two false molars above and three below.

M. Putorius, Lin.; *le Putois*, Buff.; *Fitchet* or *Polecat*, Pen. About seventeen or eighteen inches in length from the nose to the root of the tail, which is six more; it is the largest of the species; ears rounded with white tips; circumference of the mouth and sides of the nose white; forehead and space between the corners of the mouth and ears white mingled with brown; head, body, legs, and tail dark reddish-brown, or chocolate colour, nearly black, becoming lighter on the belly and hinder part of the chest. The Polecat lives in woods or thick brakes, either in old rabbit burrows or forming a shallow burrow about two yards long, which usually terminates amid the roots of trees; sometimes it is found under hay-ricks and in barns, and in Winter occasionally even in houses. It brings five or six young at a birth, and these towards the end of the Summer are capable of providing for themselves. The Polecat steals out at night, and is but rarely seen in the day-time; it is a great enemy to young poultry and game, especially Rabbits, the blood of which it is extremely fond of, so that it will often destroy more than it can eat; indeed, a couple of these animals will often destroy a whole warren. It occasionally feeds on fish also; an instance of this kind is mentioned by Bewick, in which a Polecat having been tracked in the snow from a river to its hole, was found to have deposited there eleven Eels. The Polecat is extremely nimble, runs quickly along the ground, which is almost touched by its belly, and will climb walls with great readiness; in jumping, it arches its back, and springs with much power. It is rarely hunted but in Winter, when its footsteps are easily followed in the snow. Most commonly it is taken in box traps set in ditches or under walls, the ends of the trap being fenced up aslant, for four or five yards, and two or three yards wide with earth and bushes, so that it shall not pass without entering the trap. When thus placed, a trail of Rabbits' paunches should be drawn from one trap to the other, and the trap itself baited with a piece of broiled red herring hung up over the bridge, both ends of the trap being also rubbed with it; it is also right to have the ends of the trap painted white, and rubbed over with the entrails of any animal, which will prevent Hares from entering it, at the same time that it assists in luring the vermin. Though the smell of the Polecat when alive is so rank as to be proverbial, yet its skin when dressed with the hair on, is used as fur for making tippets. It is found throughout the temperate regions of Europe, and according to Pallas, there is a whitish variety found in Russia and Siberia.

M. Furo, Lin.; *le Furet*, Buff.; *Ferret*, Pen. Is by some Zoologists considered as merely an albino variety of the Polecat; its length is fourteen inches, and the tail five; the head is narrower, and the nose sharper than in the Polecat; its colour is pale or whitish-yellow, and the eyes red and fiery. The Ferret is, according to Strabo, originally a native of Africa, and is at present known in Barbary by the name of *Fimse*; it was introduced into Spain for the purpose of destroying the Rabbits by which that country was overrun, to which it is a most unsparing enemy, generally only sucking the blood, and seldom tearing the body. They breed twice

a year, bringing five or six at a time, but they degenerate and lose their ferocity unless crossed with the Polecat, a method not unfrequently adopted by warreners, and the produce is of much darker colour than the Common Ferret. They are easily tamed, but are very soon irritated, and when angry are very apt to bite severely. As they suffer much from cold, they require to be kept in boxes filled with wool, of which they form for themselves a comfortable bed, where they sleep throughout the greater part of the day, and when they wake towards evening are fed with bread and milk. They are never found wild in England. When employed in rabbiting, they are muzzled before being put into the burrows, so as to prevent them from destroying the Rabbits, which sometimes happens when they slip the muzzle off; in this case they are liable to be lost, for as soon as they are satiated they do not come out, but fall asleep, and there continue unless smoked or dug out; if this cannot be effected, they live in the warren, preying at their pleasure throughout the Summer, but are destroyed by the Winter cold. They are extremely hostile to Rats also, for which purpose they are often kept in barns and granaries.

M. Sarmatica, Pall.; *le Putois de Pologne ou Perouasca*, Cuv.; *Sarmatian Weasel*, Pen. In its general form similar to the Polecat, but its head is narrower, the body and tail more lengthy, and the fur much shorter; it is about fourteen inches long, and the tail six, the ears short, round, and edged with long white hairs; circumference of the mouth white; the head, under surface of the body, and feet black; a white band crosses the forehead above each eye, extends backwards beneath the ears, along the sides of the neck down to the throat; from the back of the head a yellow stripe passes down obliquely towards the shoulders, and above it is a second; the upper parts of the body brownish-black striped and spotted with dusky yellow; tail full of dusky hairs intermingled with some longer white ones, its tip black. Found in Poland, especially in Volhynia, in the Southern parts of Russia, between the Dnieper and Volga, and in Asia in the Caucasian mountains and Georgia, and by report in Bucharria also. It is very voracious, preying by night upon Marmots, Mice, and other small animals, of which it first sucks the blood; it commonly lives in deserted holes of other animals, though itself capable of burrowing; is very active, moving along by jumps; is fierce, untamable, and watchful; when enraged erects its tail, and becomes extremely fetid; is said to bring four or eight young at a birth.

M. Sibirica, Pallas; *le Putois de Sibérie*, Cuv.; *Siberian Polecat*, Pen. Of a more slender form than the Polecat, and rather resembling that of the Stoat; is about twelve inches long, and the tail six; the face black, but about the nostrils whitish, and spotted towards the eyes, and sometimes about the throat; the general colour is deep yellow, approaching to fox colour; tail full of hair, and darker than the body; soles of the feet thickly covered with fur; the fur is longer and coarser than in the Polecat. It is found on the wooded mountains, from the Altaic mountains to the river Amur and the Lake Baikal; in manners it resembles the Sable, but is not found so far Northward. By the Russians it is called *Chorok*.

M. Erminea, Lin.; *le Roselet ou Hermine*, Buff.; *Stoat* or *Ermine*, Pen. The Stoat is about ten inches long, the tail five inches, and tipped with black; the edges of the ears and tips of the toes yellowish-white,

MUS-
TELA.

MUS-
TELA.

upper parts of the body reddish-brown, throat, breast, and belly white. Such is its Summer coat, and it is then called by the French *Roselet*, whilst we distinguish it by the name *Stoat*. But in Winter, it becomes white, except the tip of the tail, which retains its black colour, occasionally in England, but always in higher Northern latitudes; it is then called the *Ermine*, and now and then improperly the *White Weasel*; whilst in the mountains of Southern Asia and Persia, according to Pallas, it retains its brown colour throughout the year. It is found in the Northern parts of Europe, Asia, and America, where it exists down to the middle districts of the United States. In England the Stoat does not frequent houses, but haunts woods and hedges, especially such as border brooks. In America, however, it follows the fur-hunters, domesticating itself in their houses, and is heard through the night incessantly pursuing the White-footed Mouse. Captain Lyon mentions having seen them hunt the footsteps of this little animal like a Hound after a Fox, and he describes their burrowing in the snow, which is pushed up in the same way as Mole tracks: the passages run in a serpentine direction, and near the hole or dwelling place the circles are multiplied so as to render approach to them more intricate. In the severe cold of 1730 and 1744, these hardy animals were compelled to migrate further South. But few Ermine skins are now brought from America, as their value does not compensate for collecting them, but they are a great article of commerce in Norway and Siberia, especially in the latter, where they are found in vast numbers among the birch woods, but never in those of pine or fir; here they are either shot with blunt arrows or taken in traps, consisting of two flat stones propped by a stick to which a baited string is attached, and readily giving way on the least touch of the bait, the stones fall and kill the animal. In manners it resembles those of the Common Weasel.

The *Mustela Nivalis*, Lin. Is by some authors considered as a variety of the Ermine, and by others as a distinct species; it seems only to vary in size, being somewhat smaller than the Ermine.

M. Vulgaris, Lin.; *la Belette*, Buff.; *Common Weasel*, Pen. About six or seven inches in length, its tail two and a half more, and its height two and a half inches, so that it is nearly four times as long as its height, which gives it especially the vermiform shape assigned to the genus. It is so like the preceding species in size and in its Summer clothing, that it is often mistaken for it, but is distinguished by the tail being shorter, and never tipped with black, and by the edges of the ears, and the tips of the toes, not being white as in the Stoat. The ears are small and rounded, the whole upper part of the head and body, and the sides, reddish-brown; the throat and belly white; beneath each corner of the mouth is a brown spot. It inhabits the greater part of Europe, is common in Siberia as far as Kamtschatka, and in America so far Northward at least as the Saskatchewan River, according to Dr. Richardson. During Winter it becomes white in the Fur Countries, and is not distinguished by the traders from the Ermine. The Weasel readily takes up its residence, during Winter especially, near habitations, for the purpose of living on poultry-yards and dovecots; but in warmer weather it retires to plantations, where it makes its nest either under the roots or in the hollow of a tree; it brings four or five young at a time, which are found in Spring hidden in a bed of straw or stubble. In Scotland it is called the

Whitred. The Weasel is very destructive to young birds, poultry, and Rabbits; will attack Snakes, Water-rats, Moles, and Field Mice, of which it destroys great numbers; Pennant mentions eighty-five of the latter newly killed, which were found in a hole believed to be that of a Weasel: it also is very destructive to eggs, which it sucks with great avidity. It will follow a Hare, and sometimes hunt it in packs; to Rats it has also a great liking, haunting the water-side near corn-mills in search of them, and almost sure of being found wherever is a swarm of Rats, pursuing them into their holes, for which its small size especially fits it. Towards evening it may be seen stealing out from its hole in search of prey, and if it enter a hen-roost it does not attack the old but only the young birds, and the eggs, for the latter of which it will even kill the hen which endeavours to protect them; it carries its prey away, and does not feed on it till it becomes putrid; and in support of its preference for putrid matter, Buffon mentions the fact of a Weasel and its young ones taken in a nest made in the putrid carcass of a Wolf hung on a tree. It is remarkably active, and will readily run up a wall; its motions consist of unequal leaps, and in climbing a tree it first springs up it, several feet from the ground. In taking its prey it darts on it in the same manner, and destroys it by sucking its blood, but the aperture is so small, as scarcely to be seen. The Weasel may be tamed so as to feed out of the hand, and follow like a dog; it soon learns to know persons, and will lick the hand which feeds it. The plan to be adopted in effecting this is to stroke the animal gently over the back, and if it attempt to bite, threaten or even beat it. Perhaps it might be domesticated if its strong scent were not minded, and would then be of great service in destroying Rats and Mice, in places which a Cat cannot enter on account of its size.

From the warmer climates there are described four species.

M. Africana, Desm.; *le Putois d'Afrique*, Cuv. *African Weasel*. Ten inches in length, with a tail six inches long; the upper parts chestnut, the under yellowish-white; a very narrow chestnut streak arising at the chest passes along to the hind part of the belly dividing it into two whitish parts; the white on the edges of the lips ascends a little on the cheeks; the tail is chestnut throughout. Habitation uncertain.

M. Striata, Cuv.; *le Belette rayée*; *Striped Weasel*. About the size of the Common Weasel; the upper parts are deep brown, marked longitudinally with five parallel narrow white stripes, throughout the whole length of the back; under parts pale greyish-white; the root of the tail brown and the rest white. From Madagascar.

M. Nudipes, F. Cuv.; *le Putois du Java*, Cuv.; *Naked-footed or Javan Weasel*. Rather smaller than the common Polecat; the whole body except the head and tip of the tail covered with fur of a golden-yellow colour; the head and tip of the tail yellowish-white. The most remarkable character of the animal is its naked feet; in the Weasels generally the soles of the feet are hairy except the cuticular tubercles, but in the Javan species the whole sole including the parts between the tubercles is bare, and thus it approaches the Plantigrade Order, although it only walks on the points of the toes. From Java.

M. Zorilla, Gmel.; *le Zorille*, Buff.; *Zorilla*. About sixteen inches long, and the tail ten inches; the ground colour is black, marked with regular white spots and

MUS-
TELA.

MUS-
TELA.

stripes; a white spot is on the forehead, and each side of the head, the latter passing from the eye to the root of the ear, the edge of which also is white; on the top of the head is a white spot from which proceed four white stripes; these pass along the body and terminate at the tail; the lateral stripes are broader than those in the middle, and all widen towards the rump, where, by their separation, they leave a black spot of a trapezoid form; the tail is long and bushy, black as far as the middle, and white the remaining half; the claws of the fore feet are very strong, those of the hind in part covered with hairs. It is found at the Cape of Good Hope, where it is called the Badger or Polecat. They are often confounded with the *Zorillo* or *Mariputa* of South America, to which they are very similar. From the other Weasels they are remarkably distinguished by their disposition to dig and burrow in the earth. This circumstance has led M. F. Cuvier to arrange them in a distinct division of this genus.

M. Vison, Cuv.; *le Vison*, Buff.; *Vison Weasel*, Pen.; *Jackash*, Hearne. Length seventeen inches; the tail eight more; the head depressed and small; the nose short, flat, and thick, which together with its having the same number of false molars as the Weasels, show its situation among them, although Cuvier has placed it with the Martens; the neck is long, slender, and very flexible. The fur is short on the head, and longest on the hind part of the body and tail, the latter of which gradually tapers to the tip like that of the Otter: the fur consists of a dense brocoli-brown down, intermingled with long and strong hairs, the tips of which form a smooth coat on the body and tail, and conceal the former; the lower jaw is white, with a narrow brown mark towards the tip, and sometimes the throat has irregular white markings; the surface of the fur is chocolate or umber-brown, paler on the head and belly, but deepening on the hind part of the back and tail to blackish-brown; the whiskers are shorter than the head, very strong, and of the same colour as the fur. The legs are short, the toes connected by short webs, hairy above and beneath; the claws nearly straight, sharp, and white, but scarcely project beyond the fur. The Vison is common throughout the whole breadth of the American Continent; it was found on the banks of the Mackenzie River so high up as latitude 66° by Richardson, and he thinks it reaches up to the mouth of the river in 69°; Pennant states it is met with so far South as Carolina. It brings from four to seven young at a birth. The Vison lives much in the water, and when pursued prefers sheltering itself there to endeavouring an escape by land, on which it moves but slowly; its short, smooth fur, Otter-like tail and short legs, point out its aquatic habits. During Summer it preys on small fish, fish spawn, fresh-water mussels, &c. but when the waters are frozen in Winter, it will hunt Mice on land, and even travel a great distance over the snow in search of a rapid or fall, where the water is not frozen. It is not very timid in the water, and will approach a canoe for mere curiosity, but dives immediately on the flash of a gun. When irritated, it emits a smell nearly as fetid as that of the Skunk. The Vison is easily tamed, and then appears to be fond of warmth, and sleeps much during the day; is fond of being caressed, but is very easily offended, and will then bite sharply. Dr. Richardson mentions having seen one which passed the day in the pocket of a Canadian woman, and looked out occasionally when its attention was excited by any noise. At present the furs are of no

value, and although taken from the Indians are destroyed immediately afterwards. The same author states that he cannot ascertain whence the term Vison has arisen, but in a list of furs presented by a Montreal merchant to Kalm, in 1749, mention is made that the "*Visons* or *Foutereaux* are a kind of Martens, which live in water."

Sect. II. *Mustelæ*.—Martens.

An additional false molar on each side in the lower jaw; and a little tubercle on the carnivorous molar.

M. Martes, Lin.; *la Marte*, Buff.; *Marten*, Pen. About eighteen inches long, and the tail ten more, or twelve, if taken to the extremity of the hair; the head of a more elongated form than in the Weasels, brown mingled with red; ears wide, round, and open; the body covered with a thick, long, brown fur, the roots of which are ash coloured, the middle bright chestnut and the tips black; throat and breast white; belly same colour as the back but paler; fur on the tail very long especially at the tip, where it seems thicker than elsewhere and darker; the legs and upper part of the feet chocolate, the under part covered with thick down like that on the body; claws white, large, and sharp, well adapted for climbing trees, in which it here constantly lives. The colour of the Marten varies to ash according to its age and the different seasons in which it is taken. The skin and excrements of the Marten have a fine musky smell. It lives solitarily in the woods and never approaches habitations; but deposits its young either in the nests of birds, or in the *drays* or nests of Squirrels, and in Winter very often shelters itself in Magpies' nests. It is found throughout Europe, and it is said also in North America. The Marten is the most handsome of our indigenous beasts of prey; its motions are very elegant and nimble; and its eyes lively. The Marten, like other animals of this genus, feeds on Rats, Mice, and other vermin; poultry, game, and small birds are its common food; it will not refuse grain, and is fond of honey. It brings four to six young at a birth, which as they grow it feeds with fresh eggs and live birds, which it brings to the nest. When taken young, it is easily tamed, and is very good tempered; but its attachment cannot be relied on, as at the first opportunity it will escape to its native woods. Buffon mentions that a Marten which he tamed drank frequently, sometimes remained awake for two days, but at other times remained asleep as long; and that when preparing to take repose it folded itself round, covering its head with its tail. The scent of the Marten is very sweet to Hounds, and it is the best animal to enter young Foxhounds with: by running the thickest bushes it teaches them to run cover. When closely pursued it climbs a tree, and its agility is very great, for though frequently dropping from the tree into the midst of the pack of Hounds intent on catching it, but very few instances occur of its being taken. They make great havoc among Pheasants, which they attack whilst at roost. The best mode of catching them is with the steel trap baited with a piece of Pheasant or Wood-pigeon; but some prefer the box trap. It is called also the *Martlet*, *Martern*, and *Mertrich*, in different districts in England, where it is not very common: in Wales it is called *Belagraig*, or Rock Marten, from being supposed to live in the rocks.

M. Foina, Lin.; *le Fouine*, Buff.; *Pine Marten*, Pen. About twenty inches in total length, eight of which belong to the tail; all the upper parts are yellowish

MUS-
TELA.

MUS-
TELA.

brown, but the head is paler; tips of the ears and cheeks white; throat and breast yellow; tail bushy and of a deeper colour than the body. It inhabits Europe, across the American Continent from Hudson's Bay to the Straits of Tschuktschi, but it is not found on the Asiatic side of the Straits till Catherinebourg, a district of Siberia West of Tobolsk, and 25° West longitude distant from America. It is very rare in England, but in Scotland, where it inhabits the pine forests, it is, according to Pennant, the only one known. It is sometimes met with in Merionethshire and Caernarvonshire, where it is called *Bela goed*, or Wood Marten. It prefers colder regions, and is very common in the North of Europe, and especially in North America, but it does not extend further North than 68° latitude, where the woods cease; and for the same reason it is very rare on the Chepewyan, or Barren Lands, North of Churchill River, and East of Great Slave Lake, as also in the Tschuktschian Country as above noticed. It is found so low down as New England; but is most abundant where the trees have been killed by fire but remain standing. The mountainous and woody district of the Nipigon, North of Lake Superior, is noted for its black and valuable Marten skins. The Pine Marten feeds on Mice, Partridges, and Hares, and in Summer on the eggs of small birds; nor does it reject carrion, and often destroys the stores of meat and fish laid up by the Indians. When pursued and unable to escape, it sets up its hairs, arches its back, shows its teeth, and makes a hissing noise like the Cat; will seize a Dog firmly by the nose and bite so hard, that a Dog, unaccustomed to it, will allow its escape. They burrow in the ground, and bring from four to seven young at a litter towards the latter end of April. The fur of the Marten is fine, and often dyed to imitate sables and other costly furs; its importance as an article of commerce may be judged of by the fact, that a hundred thousand skins are annually exported from the Fur Countries. About Hudson's Bay they are taken in small log traps, which fall on and kill them; the best bait for this is a Partridge's head with the feathers on.

M. Zibellina, Lin.; *la Zibeline*, Buff.; *Sable*, Pen. In size equal to the Marten, but differs from it in having the tail shorter than the hind legs; the whiskers long and the ears rounded; the feet large, and the fur extending even under the toes, the claws of which are white; the tips of the hairs are black but ashy towards their roots; as to colour, the edges of the ears are yellowish, the chin white, ashy, or yellowish; the coat is generally brown, sometimes tawny, and occasionally quite white, which is perhaps dependent upon the time of year. They are found in Siberia, Kamtschatka, and some of the Kurile Islands between the latter Country and Japan; live in holes in the earth, or in the roots of trees, and occasionally form nests in trees; prey by night feeding principally on Hares, but also on Ermines, Weasels, and Squirrels during Summer, and on birds in Winter; in Autumn on huckleberries, and cranberries, at which time their coat is out of condition, as this vegetable food induces a kind of itch, to relieve which they rub themselves against the trees and injure their fur.

Their fur forms a very valuable article of commerce, and are worth from one to ten pounds a piece; they are considered to be in season from November to February, at which time the fur is the longest. The longer hairs are called *Os* by the Russians, and the

longer and blacker these are, the more valuable is the skin; shorter hair is found about the roots of these and is named *Podosie*, and the more there is of this kind the less valuable is the skin; the lower parts both of the *Os* and *Podosie* are called *Motchka*, which in the best skins is black in the *Os*, and grey or reddish in the *Podosie*, and when the latter, the skins are but of little value. Besides these two kinds, there is also a third sort of hair, a kind of wool called *Podsada*, which if in large quantities considerably deteriorates the skin, as it prevents the longer hairs being turned in any other than the natural direction; for one of the valuable properties of the Sable skins consists in their fur lying smooth in any given direction. The fresh skins have a gloss or *bloom* as it is called, which dies off from the older furs. The best skins are brought from Nertchisk and Yakutsk, especially about the river Ud, from the neighbourhood of which a single skin will often fetch twelve or fourteen pounds. The finer furs are sent to Russia, and the coarser to China, and are generally sold in pairs. The bellies, about two fingers broad, are sold in pairs and tied together by forty pieces, which fetch from one to two pounds; tails are sold by the hundred, at the rate of from four to eight pounds. The worse furs are often dyed, and the Chinese are especially clever in this process, so that both the imparted colour and the gloss are retained; but this manufacture is discovered by the crisping or twisting of the hair during the process which prevents their lying flat. In the more common Russian mode of dying or fumigating the skins the cheat may be easily ascertained by rubbing the hair with a moist linen cloth which imbibes the colour; and also by the speedy loss of the gloss.

Sable hunting is carried on by parties of from five to fifty persons, who divide themselves into smaller companies each provided with a leader, but all subservient to one general director. Each party is provided with a boat, a Dog and net for every two men, and a baking vessel. They pass up the rivers towing their boats against the stream till the hunting country is reached, where they disembark and build huts, in which they remain till the frost sets in, and with the first snows the season commences. Before separating for their different journeys, the hunters assemble together, and a prayer for success is offered to the Almighty. They then penetrate into the woods, marking the trees as they proceed, in order readily to find their way back, and in their progress build huts of trees, and cover them with snow; near to these they form the traps, which consist of pitfalls with a loose board placed across the top, and baited with fish or flesh; they proceed onwards building huts and traps in their course, till they reach the extent of their hunting expedition, and successively return to inspect the traps and skin the game which has been caught, but which must only be done by the chief of the party. Another mode also of taking Sables is practised: a piece of timber is placed horizontally between two trees, and upon it another aslant, and slightly supported at one end by a pole, from which extends a rod to which a bait is attached; this when meddled with disturbs the whole apparatus, and the slanting board falls and kills the animal. When Sables become scarce, the hunters track them in the snow to their holes, the entrance to which they net, and occasionally sit for two or three days watching with great patience for their prey. The first Sable taken is dedicated to the Church, and called God's Sable. When the hunting is over

—
MUSTER.

they return to head-quarters, make their reports to the director, and divide the booty: here they continue till the river be cleared of ice by the breaking up of the frost and then return home.

It does not appear that the Greeks or early Romans ever made use of furs; but about the year of our Lord 522, when Totila, King of the Visigoths, reigned in Italy, the Seuthons, a people of Modern Sweden, found means of transmitting to the Romans the precious skins of Sables, *Saphilinas pelles*, as mentioned by Jornandes *De Rebus Geticis*. Furs were subsequently used for lining the tents of Princes, and in 1252, Marco Polo found those of the Cham of Tartary lined with Ermines and Sables; the latter of which he calls *Zibelines* and *Zambolines*, and says that they, together with other valuable furs, were brought from Countries far North, from the Land of Darkness, and from regions almost inaccessible from morasses and ice. In Wales, furs were highly esteemed so early as the time of Howel Dda, who began to reign in 940. In the following century furs became still more fashionable, and when Godfrey of Bulloign, and his followers, on their way to the Holy Land, appeared before the Greek Emperor Alexis Comnenus, he was struck with the richness of their dresses, *tam ex ostro quam aurifrigio et niveo opere harmelino et ex mardrino grisioque et vario*. In England, as elsewhere, this disposition for wearing fur increased to so great an extent that, in 1337, it was enacted by Edward III. that no person should make use of it unless he could afford to spend a hundred pounds a year.

M. Canadensis, Lin.; *le Pekan*, Daubenton; *Fisher* or *Pekan*, Pen. Length twenty-three inches, and the tail including the fur ten more; head of a strong, roundish appearance, and contracted suddenly to form the nose; the eyes placed where the head curves in to form the nose, so that they seem to be placed more obliquely than they really are; ears edged with white, low, semicircular, and far apart. The fur is fine and downy towards the roots, and of a greyish or clove-brown colour, yellowish-white above, and very bright blackish-brown at the tip; is short on the head, but on the body as long though

not so fine as that of the Pine Marten, from which it further differs in the great length of the tail. So much white is seen on the head, shoulders, and fore part of the back, that they appear quite hoary, but the colour deepens towards the tail; the under parts and legs are brownish-black, but the sides of a lighter colour; the tail is covered with long black fur; frequently there is a white spot on the throat between the fore legs, and another between the hind, but these are not constant; the fore legs are short and strong; all the toes are connected with a short web, which is hairy both above and beneath: the claws strong, curved, and sharp. It has a musky smell similar to that of the Marten, but stronger. A variety is sometimes found which is entirely white, except the brown feet and nose. The Pekan is found from Pennsylvania to Great Slave Lake, and Dr. Richardson thinks extends completely across the American Continent. Its manners are very similar to those of the Marten, climbing trees with great facility, but it differs from the Marten which prefers the driest spots in Pine forests, by living in damp places near the water, but it does not seek its food there, although like that animal it will feed on dry fish. It feeds principally on Mice; is said to prey upon Frogs during Summer time; but its favourite food is reported to be the Canada Porcupine, which it kills by biting the belly.

Considerable numbers of the skins of this animal are annually sold by the Hudson's Bay Company under the name of *Woodshocks* or *Fishers*; how the Pekans have gained the latter title it is not easy to imagine, for they are not amphibious, and feed only on the smaller animals. Hearne calls them *Wejack*, which, as well as *Woodshock*, is a corruption of their Cree name *Otchæk*.

Several other species are enumerated by Linnæus, Buffon, and Pennant, but they are very confused, and require confirmation before they can be admitted.

MUSTER.

MU'STER, v. } Ger. *mustern*; D. *monsteren*;
MU'STER, n. } Sw. *moenstra*. Anciently written
mostre, It. *mostrare*; Fr. *faire un monstre*; Sp. *hazer una muestra*; from the Lat. *monstrare*, to show. Cotgrave calls the noun *monstre*, a *muster*, view, show, or sight. To *muster* is, consequentially,

To assemble or collect together, for view or review; and, generally, to assemble or collect together, to bring together.

Meddled my merchaundise. and mad a good *moustre*.
Piers Plouhman. Vision, p. 100.

That such a nombre gadred into one
Of worthie knights, neuer was sein,
Whan they in feere were *moustred* in a plein.
Lidgate. The Story of Thebes, part iii. p. 599.

And so they went and *mostred* before the Castil of Arde, the
whiche was well furnysshed with Englysshemen.
Lord Berners. Froissart. Cronycle, vol. i. ch. 254. p. 377.

When *muster* day, and foughten fieldes are odd.
Gascoigne. The Steele Glas.

I cōmaunde you in his name, that ye make to morowe your
mustres, and in likewise so shall we do ours.
Lord Berners. Froissart. Cronycle, vol. i. ch. 304. p. 453.
VOL. XXV.

Upon festivals and play-times they should exercise themselves in the fields, by riding, leaping, fencing, *mustering*, and training.
Cowley. A Proposition for the Advancement of Experimental Philosophy. The School.

The last great *muster*, ('twas before ye serv'd here
Before the last duke's death, whose honour'd bones
Now rest in peace,) this young prince had the ordering
(To crown his father's hopes) of all the army.
Beaumont and Fletcher. The Loyal Subject, act. i. sc. 1.

FALS. Shadow will serue for summer: pricke him: for wee haue
a number of shadowes to fill vppe the *muster-booke*.
Shakspeare. Henry IV. Third Part, fol. 87.

Though thou wert *muster-master* of the land.
Ben Jonson. The Vnder-wood. An Elegy.

All that were able, from 20 years old and upwards, being listed in the *muster-roll*, followed their trades, or other business, till they were called to war.

Grew. Cosmo Sacra, book iv. ch. iv. sec. 15.

In short, it is the great plague of the world, [deception] which takes wrong measures and makes false *musters* almost in every thing.
South. Sermons, vol. ii. p. 353.

Again in 1 Corinth. vi. 9, 10. we have a *muster-roll* of as vile sinners, as sin could make, or hell receive; fornicators, idolators, adulterers, thieves, covetous, drunkards, extortioners.
Id. Ib. vol. viii. p. 350.

MUSTER.

MUTE.

Prone on the lowly grave of the dear man
She drops; whilst busy meddling memory,
In barbarous successions, *musters* up
The past endearments of their softer hours,
Tenacious of its theme.

Blair. *The Grave*.

MUTE, *v.* } Fr. *muable*; It. *mutabile*; Sp.
MU'TABLE, } *mudabile*; Lat. *mutabilis*; from *mu-*
MUTAB'LITY, } *tare*, to change;
MUTA'TION. } That can or may be changed or

altered; changeable, alterable, fickle, unsteady, inconstant.

The which destinable causes, when they passen out from the beginninges of unmovable perueiaunce, it mote nedes be that they ne be not *mutable*, as thus. Chaucer. *Boecius*, book iv. p. 442.

For if her whele stint any thing to tourne,
Than cesseth she Fortune anone to be:
Now sith her whele by no way may sojourn,
What wost thou of her *mutabilitie*?

Id. *Troilus and Creseide*, book i. p. 235.

And here I vow me, faithful, true, and kind,
Without offence of *mutabilitie*
Humbly to serve, while I have wit and mind.

Have I *muted* all my feathers.

Beaumont and Fletcher. *The Little Thief*, act iv. sc. 1.

It may be, gnats and flies have their imagination more *mutable*, and giddy, as small birds likewise have.

Bacon. *Natural History*, Cent. viii. sec. 698.

What man that sees the ever-whirling wheele
Of change, the which all mortall things doth sway
But that thereby doth find, and plainly feele,
How *mutability* in them doth play
Her cruell sports to many men's decay.

Spenser. *Faerie Queene*. Of *Mutabilitie*, can. 6.

But all that moveth doth *mutation* love.

Id. *Id.* book viii. can. 7.

For in both there seemes to be a valuation of time; which whether in case of *mutation*, or sale, may justly be suspected for unlawful.

Hall. *Works*, vol. iii. fol. 788. *Cases of Conscience*, dec. 1. case 4.

It [political wisdom and prudence] depends upon the uncertain wills and fickle humours, the mistaken and *mutable* interests of men, which are perpetually shifting from one point to another, so that nobody knows where to find them.

Tillotson. *Works*, fol. 496. *Sermon* 41.

Now there is a passage from death to life and from a state of weakness and corruption to a state of glory and immortality, which can never suffer by tribulation or infirmities, or the disorder and *mutability* of this state.

Stillfleet. *Sermon* 3. vol. iii. p. 126.

Their *mutable* complexions carry
The looks of anger, hope, and joy;
Just as the scenes around 'em vary,
Pleasures delight, or pains annoy.

Cooper. *The Temper of Aristippus*, epis. 2.

And, studious of *mutation* still discard
A real elegance, a little us'd,
For monstrous novelty and strange disguise.

Cowper. *The Task*, book ii.

MUTE, *v.* } Fr. *mutir*, *esmeutir*; seems formed
MUTE, *n.* } upon the noun *esmeute*, a motion or
MU'TING *n.* } commotion; and to be employed, phy-

sically or medically, as to *move*, a *motion*, now in English are. And thus,

Mute, that which is *moved*, (*motum*;) sc. out of the bowels. And see FALCONRY.

Upon the oake, the plumbe-tree and the holme,
The stock-dove and the blackbird should not come,
Whose *muting* on those trees does make to grow
Rots-curing hyphear, and the misseltoe.

Browne. *Britannia's Pastorals*, book i. song 1.

According unto ancient tradition and Plinie's relation, the bird not able to digest the fruit whereon she feedeth; from her inconverted *muting*, ariseth this plant of the berries where of birdlime is made wherewith she is after entangled.

Sir Thomas Brown. *Vulgar Errours*, book ii. ch. vi. p. 110.

And I knew not that there were sparrows in the wall, and mine eyes being open the sparrows *muted* warm dung into mine eyes and a whiteness came in mine eyes.

Bible. *Modern Version*, Tobit, ch. ii. v. 10.

With hooting wild
Thou causest uproars; and our holy things,
Font, table, pulpit, they be all defil'd
With thy broad *mutings*.

More. *Life of the Soul*, vol. ii. p. 119.

And nigh an ancient obelisk
Was rais'd by him, found out by Fisk,
On which was written, not in words,
But hieroglyphic *mute* of birds.

Butler. *Hudibras*, part ii. can. 3.

MUTE, *adj.* } Fr. *muet*, *mut*; It. *muto*; Sp. *mudo*;
MUTE, *n.* } Lat. *mutus*: which Scheidius derives
MU'TELY, } from Gr. *μύειν*, *claudere*, to close, to
MU'TENESS. } stop; having a reason for its applica-
tion similar to that for the English *Dumb*, q. v.

Having the organs of speech *dammed* up, stopt, or closed; and thus, speechless, silent.

She said eke, she was fain with him to mete,
And stode forth *muet*, milde, & mansuette.

Chaucer. *Troilus and Creseide*, book v.

She was so true, as women been echone,
And also close and *muet* as stone.

Lidgate. *The Story of Thebes*, part iii. p. 592.

Lyke your pus cat parrot can *mute* and cry.

Skelton. *Speak Parrot*.

We may fitly transfer the apophthegme of Simonides, from painting unto dancing, and say thus, that a dance is a *mute* poesie, and poesie a speaking dance.

Holland. *Plutarch*, fol. 656. *Of Symposiaques*, quest. 15.

Hail native Language that by sinews weak
Didst move my first endeavouring tongue to speak,
And mid'st imperfect words with childish trips,
Half unpronounc'd, slide through my infant lips,
Driving dumb silence from the portal door,
Where he had *mutely* sat two years before.

Milton. *At a Vacation Exercise*.

The soberest and best govern'd men are least practis'd in these affairs; and who knows not that the bashful *muteness* of a virgin may oft-times hide all the unliveliness and natural sloth which is really unfit for conversation.

Id. *Works*, vol. i. p. 171. *The Discipline and Doctrine of Divorce*, book i. ch. iii.

To the indictment here upon, he prays council might be allowed him to plead the illegality of it; which being denied him by the judges, and the sentence of a *mute* threatened, he at length gave into court his exceptions ingrossed in parchment.

Wood. *Athenæ Oxonienses*, vol. ii. fol. 304.

The bear, the boar, and every savage name,
Wild in effect, though in appearance tame,
Lay waste thy woods, destroy thy blissful bower,
And, muzzled though they seem, the *muties* devour.

Dryden. *The Hind and the Panther*.

Regularly a prisoner is said to stand *mute*, when, being arraigned for treason or felony, he either, 1. makes no answer at all: or, 2. answers foreign to the purpose, or with such matter as is not

MUTE.

MUTE. allowable; and will not answer otherwise: or, 3. upon having pleaded not guilty, refuses to put himself upon the country.

Blackstone. Commentaries, book iv. ch. xxv.

Bribe him, to feast my *mute-imploring* eye,
With some proud lord, who smiles a gracious lie!
A lie to captivate my heedless youth,
Degrade my talents, and debauch my truth.

Smollett. Advice, a Satire.

The **MUTES**, or dumb attendants of the Seraglio, are usually represented in Tragedies, in which the scene is laid at Constantinople, as executioners. From Sir Paul Rycaut's account, however, that odious office by no means belongs to them. "Besides the Pages there is a sort of attendants to make up the Ottoman Court called *Bizebani*, or Mutes, men naturally born deaf, and so, consequently, for want of receiving the sound of words, are dumb. These are by number about 40, who are lodged by night amongst the Pages in the two chambers; but in the daytime have their stations before the Mosque belonging to the Pages where they learn and perfect themselves in the language of the Mutes, which is made up of several signs, in which by custom they can discourse, and fully express themselves; not only to signify their sense in familiar questions, but to recount stories, understand the fables of their own Religion, the laws and precepts of the Alchoran, the name of Mahomet, and what else may be capable of being expressed by the tongue. The most ancient amongst them, to the number of about eight or nine, are called the Favourite Mutes, and are admitted to attendance on the Haz Oda, who only serve in the place of Buffoons for the Grand Segnior to sport with, whom he sometimes kicks, sometimes throws in the cisterns of water, sometimes makes fight together like the combat of Climeas and Dametas. But this language of the Mutes is so much in fashion in the Ottoman Court, that none almost but can deliver his sense in it, and is of much use to those who attend the presence of the Grand Segnior, before whom it is not reverend or seemly so much as a whisper." Book i. c. 8.

MUTE, in *Law*, is one who being arraigned upon an indictment of Treason or Felony, and asked whether he be guilty or not guilty of the charge, either makes no answer at all, or, what is equivalent thereto, makes an answer foreign to the purpose. When a prisoner behaves in this way, the first step is to impanel a Jury to try whether he be dumb from the visitation of God, or be silent from obstinacy. If the Jury find that he is dumb, the trial must proceed as if "not guilty" had been pleaded. If, however, the Jury find that his silence proceeds from obstinacy, the case is different. In cases of High Treason, and of all Misdemeanours, obstinate silence hath always subjected the prisoner to be treated as if he were convicted, but now by Stat. 7 and 8 Geo. IV. c. 28. sec. 2. the Judge may in these cases, if he think fit, order a plea of "not guilty" to be entered, and proceed with the trial as if the prisoner had pleaded. In all other cases of felony the prisoner by obstinately refusing to plead could formerly have escaped conviction with its consequences, amongst which the forfeiture of the lands to the lord was one of the most important; but the alternative was dreadful. For upon the jury's finding that he was silent from malice, judgment of the *peine forte et dure* was passed against him; which judgment was that the prisoner be taken back to prison; be put into a low, dark chamber; be laid naked on his back upon the floor; have a weight of iron, as much as he could bear *and more*, placed upon

him; have no sustenance, save only three morsels of the worst bread on the first day, and three draughts of standing water on the second, and be so kept, with such sustenance on the alternate days, until he answered, or (as the judgment afterwards more appropriately expressed it) until he died. But now by Stat. 12 Geo. III. c. 20. instead of the *peine forte et dure*, the prisoner is to be treated as if he were convicted, except when the Judge thinks fit to direct a plea of "not guilty" to be entered, and to proceed with the Trial, which, as in cases of High Treason, Misdemeanour, and Piracy, he is authorized to do by 7 and 8 Geo. IV. c. 28. sec. 2. See *Blackstone, Commentaries*, vol. iv. p. 324.

MU'TILATE, } Fr. *mutiler*; It. *mutilare*; Sp. *MUTILA'TION*. } *mutilar*; Lat. *mutilare*, from *mutilus*, i. e. *captus aliqua parte corporis*, from *mutus*, dumb. See **MUTE**, *ante*.

To take away, cut off, in any way deprive of, some part of the entire body; to maim, to dismember.

Yea we are much bound vnto him, although he haue made vs imperfect and *mutilate*.

Frith. Workes, fol. 90. *A Treatise vpon the Sacrament of Baptisme.*

As I haue declared you before in my preface, I will not in any worde wyllinglye mangle or *mutilate* that honourable man's worke.

Sir Thomas More. Workes, fol. 1291. *A Treatise vpon the Passion.*

Any one that will take but a little pains in examining the nature of them, may be fully satisfied that the scriptures are hereby, neither *mutilated* or depraved.

Grew. Cosmo Sacra, book v. ch. i. sec. 40. p. 289.

For we observe the *mutilations* are not transmitted from father unto son; the blinde begetting suche as can see, men with one eye, children with two; and cripples *mutilate* in their own persons do come out perfect in their generations.

Sir Thomas Brown. Vulgar Errours, book vii. ch. ii.

Because the loss or *mutilation* of an able man, is also a loss to the commonweal.

Ralegh. History of the World, book v. ch. iii. sec. 2. fol. 680.

He [Coluthus Lycopolites] is said to have been the author of several poems; none of which have come down to us except this, which in many passages is corrupt and *mutilated*.

Fawkes. Notes to the Rape of Helen.

When a man is in eminent danger of the *mutilation* of a leg or an arm, or the like, it is lawful to prevent the loss of either by the death of the assailant.

South. Sermons, vol. x. p. 239.

The rhapsodies of Homer were scattered up and down amongst the cities of Greece, which the itinerant poet had visited, and were necessarily in a very *mutilated* state, or recorded in men's memories after an imperfect manner and by peace-meal only.

Observer, No. 120.

MUTILLA, in *Zoology*, a genus of *Hymenopterous* insects.

Generic character. *Antennæ* longer than the head, filiform, situated in the front of the head, the first and second joints elongate; maxillary *palpi* longer than the maxillæ; head large; *abdomen* oval in both sexes, convex, the second segment large; *thorax* cubical; wings with one marginal and three submarginal areolets; wanting in the females.

Type of the genus, *M. Europea*, Linnæus; Donovan, *Brit. Ins.* pl. vi. fig. 212. Several species, most of which inhabit the warmer and the more temperate regions; few only have as yet been detected in Britain, where they seem to affect sandy districts.

MU'TINE, or } Fr. *mutiner*; It. *mutinare*; Sp. *MU'TINY*, } *amotinarse*. Skinner says from *MUTINE'ER*, } *motus*, a motion, or from *mutire*, to *MU'TINOUS*, } murmur. His first conjecture seems *MU'TINOUSLY*. } the more rational, i. e. from *motus*.

MUTE.
MUTINY.

MUTINY. but through the verb *mutir*, *esmeutir*, to move; *esmeute*, a motion or commotion.

To move or commove; to raise a commotion, to (insurge or) make an insurrection; to rise, *sc.* against authority.

This was good for Maximilian, if he could have seen the people *mutined*, to arrest fury, and prevent dispaire.

Bacon. King Henry VII. fol. 86.

He staid the legion at Bebricum being hardly withholden from *mutining*, because he would not lead them to fight.

Savile. Tacitus, book ii. ch. ix. fol. 65.

Doe like the *mutines* of Jerusalem,
Be friends awhile.

Shakspeare. King John, fol. 6.

Great prince, it is within your power with ease,
To remedy such fears, such jealousies,
And rid you of such *mutineers* as these.

Daniel. History of Civil Wars, book i.

Then brought he forth Sedition, breeding stryfe
In troublous wits and *mutinous* upore.

Spenser. Faerie Queene, book v. can. 9.

The same soldiers, who in hard service and in the battle, are in perfect subjection to their leaders, in peace and luxury are apt to *mutiny* and rebell.

South. Sermons, vol. iv. p. 83.

Hugh Peters held a discourse with the arch-rebel his master upon the *mutinying* of the army about St. Alban's.

Id. Ib. vol. vi. p. 28.

In 1486, Bartholomew Diaz, a Portuguese captain, with three ships attempted the discovery of India by the coast of Africa; but, harassed by tempests, his crew *mutined*, and having discovered the river del Infante, on the Eastern side of Africa, he returned to Europe.

Mickle. Discovery of India. Appendix.

On the 14th of April, 1797, Lord Bridport, the admiral, unsuspecting of the *mutiny*, making a signal to prepare for sea, the seamen of his own ship, instead of weighing anchor, ran up the shrouds, and gave three cheers, which were instantly answered from the other ships.

Belsham. History of Great Britain. George III. Anno 1797.

MUTINY on board of a merchant vessel was not formerly punishable by death in this Country; but now by Statute 11 and 12 William III. c. 7. sec. 9., made perpetual by 6 George I. c. 19., it is enacted that, if any seaman or mariner who shall in any place where the admiral has jurisdiction, lay violent hands on his commander, whereby to hinder him from fighting in defence of the ship and goods committed to his charge, or shall confine his master, or make or endeavour to make a revolt in the ship, shall suffer pains of death, loss of lands, goods and chattels, as pirates, felons, and robbers upon the seas ought to have and suffer. Offences of a similar nature, such as the running away with the ship, or any barge, boat, ordnance, ammunition, goods, or merchandises, the yielding of them up voluntarily to pirates, the bringing of seducing messages from pirates, enemies, or rebels, the confederating with or attempting to corrupt any commander or mariner to yield up or run away with the ship, &c., the turning pirate or going over to pirates, are by the same Acts punishable in the same way. By other Statutes, the wilful destruction, casting away, or burning of any ship, with intent to injure the owner, is punishable with death. In case of Mutiny the master is justified in using means sufficient to repress it, and if the death of any of the Mutineers ensue, the master is justified, provided the force which he uses be fairly required by the exigency of the occasion; and the master's conduct is not to be scanned too nicely, as it must be borne in mind that he is generally far removed from all assistance, and that his own safety and

that of the ship and cargo chiefly depend upon the due maintenance of his authority. **MUTINY.**

Mutiny in the Royal Navy is punishable under the provisions of the Statute 22 George II. c. 33. which contains the rules or *Articles* of the Navy. Among the numerous offences enumerated in that Statute, those which partake of the character of Mutiny are as follows: the running away with the ship, or any ordnance, ammunition, or stores belonging thereto, the making or endeavouring to make any Mutinous assembly, the uttering of any words of sedition or Mutiny, the concealing of any traitorous or Mutinous design, the striking of a superior officer, or drawing or offering to draw or lift up any weapon against him, being in the execution of his office, on any pretence whatsoever, the presuming to quarrel with a superior officer, being in the execution of his office, or the disobeying of any lawful command of a superior officer. All the above offences are punishable with death; with regard to some, and those the least heinous of them, the Court Martial has a discretionary power of awarding a less punishment. The behaving with contempt towards a superior officer, being in the execution of his office, the concealing of traitorous or Mutinous words spoken by any to the prejudice of his Majesty or Government, or the concealing of any words, practice, or design, tending to the hinderance of the service, and not revealing the same to the commanding officer, and the endeavouring to make a disturbance on account of the unwholesomeness of the victual, or on any other ground, are punishable with such punishment as a Court Martial shall think fit to award.

Mutiny in the Army is punishable under the *Mutiny Act*. This Act authorizes his Majesty to keep a standing army on foot, the doing of which in time of Peace, without the consent of the two Houses of Parliament, is against Law; it fixes the number of the men, and it empowers his Majesty to proceed by Martial Law against those who offend in the particulars enumerated in the Act or against the Articles of War; a power which in time of Peace is derived solely from the Act, for it is a principle of the Constitution, that no man can be forejudged of life or limb, or subjected in time of peace to any punishment within this realm by Martial Law, or in any other way than by the judgment of his peers, and according to the known and established Laws of the realm. The Mutiny Act always contains a proviso, that it shall only continue in force for one year; by which means it is competent to either of the three branches of the Legislature to refuse to renew the Act when it expires, and by so doing to prevent the Army from being continued on its former footing. Though this power is considered by constitutional lawyers of the greatest importance, as affording to each branch of the Legislature a check upon the other two, it has happily never been put into execution, and the Act, with alterations suited to the occasion, is regularly passed every year, the last Act being 1 William IV. c. 15.

By this Act the King is empowered to make Articles of War, *i. e.* rules or orders, for the better government of the Army. The Navy in this respect has an advantage over the Army, for while the Articles of War for the regulation of the latter are left by the Mutiny Act to the discretion of the King, those for the regulation of the former are, as has been stated above, fixed and ascertained by the Act of Parliament 22 Geo. II. c. 33. The Mutiny Act, however, provides that no offence shall be made punishable with death except those which are

MUTINY. specified therein. These are, Mutiny and sedition; not endeavouring to suppress the same; not giving information of the same to the commanding officer; misbehaviour before the enemy; shamefully abandoning or giving up a post; compelling the commanding officer so to do; leaving one's post before relieved; being found sleeping on one's post; holding correspondence with any rebel or enemy; entering into terms with the same without the license of his Majesty or of the commanding officer; striking or using violence towards a superior officer, being in the execution of his duty; disobeying any lawful command of a superior officer; and deserting.

The Mutiny Act does not exempt any officer or soldier from being proceeded against by the ordinary course of Law; on the contrary, it enacts that any commanding officer who shall neglect or refuse, upon application, to deliver over to the Civil magistrate any officer or soldier accused of any capital crime, or of any offence which is punishable by the known laws of the land, or shall wilfully neglect or refuse to assist the officers of justice in apprehending such offender, shall, upon conviction thereof in any of his Majesty's Courts at Westminster, Dublin, or Edinburgh, be deemed to be *ipso facto* cashiered, and shall be utterly disabled to have or hold any Civil or Military office or employment within the United Kingdom of Great Britain and Ireland, or in his Majesty's service.

The Act settles the constitution and powers of Courts Martial; it contains regulations relating to the enlistment of recruits, the billeting of the soldiers, and the apprehension of deserters; and it provides, that no person enlisted as a soldier, shall be taken away from the service for a debt under £30, but the details are too long for admission into our Work.

MUTISIA, in Botany, a genus of the class *Syngenesia*, order *Superflua*, natural order *Corymbiferae*. Generic character: calyx cylindrical, imbricated with broad scales; flowers of the disk three-cleft; anthers terminating in five bristles; receptacle naked, down plumose (leaves cirrhose.)

Eleven species, natives of South America,

MUTTER, v. } In D. *muyten*; Lat. *mutire*; to
MUTTER, n. } speak as one *mute*, or having the
MUTTERER, } organs of speech stopped or ob-
MUTTERING. } structed. See MUTE.

To speak inarticulately, indistinctly.

With that he smote his hedde adowne anone
And gan to muttre, I nat what truely.

To the flesh or meat of sheep; formerly to the animal itself.

And gaf hem echone
Coupes of elene gold. and coppes of selver
Rynges w^t rubies. and op^r riche giftes
The leste of here meyne. a moten of golde.

Piers Plouhman. *Vision*, p. 39.

The wolfe in peace with the motton.

Gower. *Conf. Am.* book i. p. 16.

Fyue flocks of sheepe could scarce maintaine
good mutten for his house.

Gascoigne. *Flowers. A Gloze vpon this Text, Dominus ejus opus habet.*

Also by reason of the murren that fell among the cattell, beefes
and muttons were vnresonable priced.

Holinshed. *Edward II.* Anno 1317.

For the offenders and breakers of the law were condemned to
pay for a penalty, the value of five oxon and two muttons.

Sir Thomas North. *Plutarch*, fol. 87. *Publicola.*

At the great triumph and entry made, the captain or generall that
triumpheth as a conqueror, did offer the sacrifice (by the old orders
and ancient customs of Rome) one or diuers oxon: where at the
second triumph called the ovation, he onely sacrificed a mutton.

Id. *Ib.* fol. 265. *Marcellus.*

The felon thus of old, his name to save,
His pilfer'd mutton to a brother gave.

Falconer. *The Demagogue.*

MUTUAL, } Fr. *mutuel*; It. *mutuo*; Sp. *mutual*;
MU'TUALLY, } Lat. *mutuus*. Varro says the Romans
MUTUA'LITY. } had the word from the Sicilian, *μοῖτον*,
which Vossius thinks is formed of *μοῖ τέον*, or *μοῖ τόν*,
mihi tuum.

Interchangeable, reciprocal.

Well let this passe, and thinke vpon the ioye,
The mutuall loue, the confidence, the trust,
Whereby we both abandoned annoye,
And fed our mindes with fruites of louely lust.

Gascoigne. *Dan Bartholmew of Bathe.*

He neyther seeth assemblies, nor can assigne and proue any
cōspyracy & mutuall promise in assisting eche other about the
procurement of any thyng at all good or badde.

Sir Thomas More. *Workes*, fol. 1019. *The Debellation of Salem
and Byzance.*

Th' uncertain Commons touch'd with inward care,
As though his sorrows mutually they bare.

Drayton. *England's Heroical Epistles. Queen Isabel to King
Richard II.*

Her goodly wares of mercenary masses, of pardons and indul-
gences of the mutuall good works of their pretended holy men
and women.

More. *Ant. against Idolatry*, ch. x.

Among unequals what society
Can sort, what harmony or true delight?
Which must be mutual, in proportion due
Giv'n and received.

Milton. *Paradise Lost*, book viii. l. 385.

God, in the nature of each Being, founds
Its proper bliss, and sets its proper bounds:
But as he fram'd a whole, the whole to bless,
On mutual wants built mutual happiness:
So from the first eternal order ran,
And creature link'd to creature, man to man.

Pope. *Essay on Man*, epis. 3. l. 112.

MUTTER.

MUTUAL.

MUTUAL.

MY.

May I, at least, the sacred pleasures know
Of strictest amity; nor ever want
A friend, with whom I *mutually* may share
Gladness and anguish, by kind intercourse
Of speech and offices. *J. Philips. Cider, book i.*

The sciences are said, and they are truly said to have that *mutual*
connexion, that any one of them may be the better understood for
an insight into the rest. *Horsley. Sermon 1. vol. i. p. 8.*

MU'ZZLE, v. } Anciently written *mosel*. Fr.
MU'ZZLE, n. } *museliere*; It. *musoliera*. From Fr.
museau, It. *muso*, which Skinner thinks may have been
formed from the A. S. *muth*, the mouth. *Muzzle* is
applied to

The mouth; and to any thing to fasten, close, or
confine the mouth. To *muzzle*,

To do any thing with the *mouth* or *muzzle*; to fasten,
to bind, to constrain the mouth.

And like a greyhound the *mosell* and the head.
Lidgate. The Story of Thebes, part iii.

About his char ther wenten white alanns,
Twenty and mo, as gret as any sterc,
To huntun at the leon or the dere,
And folwed him, with *mosel* fast ybound.
Chaucer. The Knightes Tale, v. 2135.

Thou shalte not *mosel* the oxe that treadeth out the corne.
Bible, Anno 1551. Deuteronomy, ch. xxv.

Or who will *muzzle* that unruly bear
Whose presence strikes our people's hearts with fear?
Drayton. Queen Margaret to the Duke of Norfolk.

At last, when as he found his force to shrinke
And rage to quaille, he took a *muzzle* strong
Of surest yron made with many a lincke.
Spenser. Faerie Queene, book vi. can. 12.

How wretched is the fate of those who write!
Brought *muzzled* to the stage, for fear they bite.
Dryden. Prologue to the Pilgrim. Prologue 42.

Of a black *muzzle*, and long beard, beware;
And let a skilful barber cut your hair.
Id. Ovid. Art of Love.

MY, } Fr. *mien*, *mon*; It. *mio*; Sp. *mio*;
MINE, } Lat. *meus*; Gr. *ἐμὸς*; Goth. *meins*;
MYSELF. } A. S. *min*; D. *myn*; Ger. *meyn*; Sw.
min. See ME.

Of or belonging to *me*.

Ac for *me my self*, ich wol soþ segge of þis dede.
R. Gloucester, p. 30.

For mon þou art y wis,
To wynne get a kyngdom, wel beter þan *myn ys*.
Id. p. 13.

þe dede þat I did ille, *my* foly it was,
I praye þe with gode wille, forgýue *me* þat trespas.
R. Brunne, p. 163.

And ich schal sende þow *myselfe* Seynt Michel *myn* aungel.
Piers Plouhman. Vision, p. 194.

I *mysilf* bi the soule serue to the lawe of God, but bi fleishe to
the lawe of synne. *Wiclif. Romayns, ch. vii.*

And Jhesus seide to her, what to *me* and to thee womman? *myn*
our cam not yet. *Id. John, ch. ii.*

Jesus sayde vnto her: Woman, what haue I to doe with thee?
Myne houre is not yet come. *Bible, Anno 1551.*

And for to maken you the more mery,
I wol *myselfen* gladly with you ride,
Right at *myn owen* cost, and be your gide.
Chaucer. The Knightes Tale, v. 805.

I maie not stretche vp to the heuen
Myn honde ne set al in euen,
This worlde which euer is in balance.
It stant not in *my* suffisance
So greate thinges to compasse.
Gower. Conf. Am. book i. p. 16.

And for to proue it is so
I am *my selfe* one of tho
Which to this schole am vnderfonge.
Gower. Conf. Am. book i. p. 16.

When I was yet a child, no childish play
To *me* was pleasing, all *my* mind was set,
Serious to learn and know, and thence to do
What might be publick good; *myself* I thought
Born to that end, born to promote all truth,
All righteous things; therefore above *my* years,
The law of God I read, and found it sweet.

Milton. Paradise Regained, book i. l. 202.

If God shall be pleased to make *me* his almoner, and the conduit
by which his goodness may descend upon *my* distressed neighbour;
though the charity be personally *mine*, yet both of us have cause
to thank God for it, I that I can be virtuous, and he that he is re-
lieved. *South. Sermons, vol. iv. p. 75.*

When a man deceives *me* once, says the Italian proverb, it is his
fault; when twice, it is *mine*.

Horne. Works, vol. vi. p. 66. Discourse 5. note.

MYA, in Zoology, a genus of *Acephalous Mollusca*.

Generic character. Shell equivalve, transverse, gaping
at both ends; left valve with a large, compressed,
rounded tooth, projecting almost vertically, and a hollow
in the other valve; ligament entire; interior mantle
united before; foot thick, posterior.

Type of the genus, *M. truncata*, Linnæus; Pennant,
Britt. Zool. vol. iv. pl. xli. fig. 14. Several species,
four of which inhabit Britain; they burrow in the sand,
and project their long tube to the surface.

MYAGRUM, in Botany, a genus of the class *Tetra-*
dynamia, order *Siliculosæ*, natural order *Cruciferae*.
Generic character: calyx rather erect; corolla, petals
oblong, scarcely larger than the calyx; pouch coriaceous,
valveless, cells alternately fertile and barren.

Seven species, natives of the South of Europe.

MYCETEA, in Zoology, a genus of *Coleopterous*
insects.

Generic character. *Antennæ* about as long as the
thorax, the basal joint large, robust, subcylindric; the
second small, slightly elongate, cylindric; the third to
the eighth shorter, more slender, and of uniform length;
the ninth rather large, transverse, cup-shaped; the
tenth still larger, subglobose; the eleventh very large,
ovate-obtuse; *palpi* short, minute, the terminal joint
subulated; head subquadrate, convex; eyes small,
slightly prominent; *thorax* short, transverse, emarginate
anteriorly, the lateral margins slightly rounded, entire,
with a distinct elevated line parallel thereto on the disc;
elytra ovate, convex, punctate-striated, entire, acute at
the apex; body convex; legs rather short; *tibiæ* simple;
tarsi anterior, with an appendage at the base.

Type of the genus, *Dermestes fumatus*, Marsham.
Stephens, *Illust. Brit. Entom. (Mandibulata.) vol. iii.*
pl. xvii. fig. 1. One species only, which inhabits Britain,
frequenting damp cellars, &c.

MYCETOBIA, in Zoology, a genus of *Dipterous*
insects.

Generic character. *Antennæ* porrected, cylindric,
sixteen-jointed, with the two basal joints distinct; eyes
kidney-shaped; *stemmata* three, frontal, unequal, approx-
imating, placed in a triangle; *tibiæ* with the sides un-
armed.

Type of the genus, *M. pallipes*, Meigen, vol. i. pl. viii.
fig. 10. Four species, two of which are indigenous.

MYCETOCHARIS, in Zoology, a genus of *Coleop-*
terous insects.

Generic character. *Antennæ* slightly filiform; *palpi*
four; anterior securiform; posterior clavate, truncate;
labium rounded, entire; head short, round; body

MY.

MYCETO-
CHARIS.

MYCETO-CHARIS. linear-elongate, slightly convex, pubescent; legs moderate; *tarsi* heteromorous, the terminal joint entire, not bilobed.

MYC-TERIA.

Type of the genus, *Cistela linearis*, Illiger; Panzer, *Faun. Germ.* vol. xxv. fol. 16. Six or eight European species, of which one at least inhabits Britain; they are all found in decaying trees, amongst fungi.

MYCETOPHAGUS, in *Zoology*, a genus of *Coleopterous* insects.

Generic character. *Antennæ* scarcely as long as the thorax, gradually incrassated to the apex, the five last joints forming an indistinct, perfoliated club, the four basal joints of which are cup-shaped, the last more or less elongate-ovate; *palpi* with the last joint rather incrassated, subtruncate; head small, triangular; eyes slightly prominent; *thorax* transverse, rather convex, broadest posteriorly and closely applied to the base of the *elytra*, which are subovate; body ovate, slightly convex; *tarsi* filiform, four-jointed; the males with the anterior three-jointed only.

Type of the genus, *Chrysomela 4-pustulata*, Linnæus; Donovan, vol. vi. pl. 185. fig. 5. About ten species, of which eight inhabit Britain, feeding upon fungi and agarici.

MYCETOPHILA, in *Zoology*, a genus of *Dipterous* insects.

Generic character. *Antennæ* porrected, compressed, sixteen-jointed, with the two basal joints distinct; eyes oblong; *stemmata* three, indistinct; *tibiæ* furnished at the apex with spurs; posterior with the sides spinous.

Type of the genus, *M. lunata*, Fabricius; Meigen, vol. i. pl. ix. fig. 15. Nearly fifty species, subsisting in their larva state upon fungi, above half of which have been discovered in Britain.

MYCTERIA, from the Greek *μυκτήρ*, a nose, Lin., Cuv.; *Jabiru*, Ray, Lath. In *Zoology*, a genus of animals belonging to the family *Cultrirostres*, order *Grallæ*, class *Aves*.

Generic character. Beak long, conical, compressed, slightly curved upwards, smooth, strong, and pointed; mandibles straight, the upper trigonal, the lower much thicker and inclined upwards; gape of moderate size; nostrils longitudinal and narrow; head and neck more or less bare; *tarsi* reticulate; front toes connected by membrane.

This genus differs little from the *Cranes*, except in the curving of the beak, which Temminck asserts does not really exist in nature, but only in the bad delineations of the animal; he therefore includes the whole genus with the *Cranes*, as does Illiger. In their habits they closely resemble the *Cranes*.

M. Americana, Lin.; *le Jabiru*, Buff.; *American Jabiru*, Lath. About the size of a Swan, and four feet and a half high; beak thirteen inches long and three wide at the base, black, pointed, and cutting; head and neck covered with featherless black skin, with a few small whitish feathers on the occiput, and having a red spot at the lower part; the neck thick, skin wrinkled, and so placed as to have the appearance of a Cow's dewlap, whence, according to Azara, arises the term *Jabiru*, which, in the Guarani language, signifies any thing distended with air. The twelve caudal quills are equal, and reach slightly beyond the wings. The general colour white, and around the neck a red collar, but this loses its colour in drying; the legs are black. In the young bird the neck is partially covered with feathers, but as it attains its full plumage, which occurs in the

third year, all these feathers fall off; and till that time the plumage is greyish with a tinge of rose colour. The *Jabiru* is found in the marshy districts of South America, and especially in Guiana; it is very voracious, and feeds entirely on fish and reptiles. It builds its nest in large trees, by carefully knitting the long branches together, and the female there lays two eggs; when hatched, the young are fed with fish brought by the parent birds, which also show great courage in defending them.

M. Senegalensis, Lath.; *Senegal Jabiru*. Rather larger than the preceding; the beak is red at the tip, and otherwise white throughout, except a black spot at the base and a white stripe on each side; the plumage white, except the scapulars, which are black, as are also the neck and legs. Lesson considers it to be the same as Temminck's *Ciconia Ephippiorhyncha*, which, as he happily observes, is *nom barbare, difficile à prononcer et à orthographier*. It inhabits the Western coast of Africa.

M. Australis, Lath.; *Australian Jabiru*. About the size of the American species; the head and neck are clad in blackish-green feathers, but the throat is half naked and red in the adult: the plumage is white, except the head and neck, and the black scapulars, the wing and tail-coverts. From New Holland.

See Linnæi *Systema Naturæ* a Gmelin; Cuvier, *Règne Animal*; Latham, *General Synopsis of Birds*.

MYCTERUS, in *Zoology*, a genus of *Coleopterous* insects.

Generic character. *Antennæ* linear, composed of eleven obconic joints, nearly of equal size and length, the second, as is very usual, being the shortest, and the third longest, they are placed a little eccentric, so as to appear serrated within; head produced anteriorly into a rostrum, which is not very long; eyes prominent; *thorax* obconic; *elytra* ovate, slightly convex; *tarsi* pentamerous.

Type of the genus *M. griseus*, Fabricius; Clairville, *Ent. Helv.* vol. i. p. 124. pl. xvi. One species only, which is sometimes found abundantly in Switzerland; it also occurs in Britain, but is very rare.

MYCTRIS, in *Zoology*, a genus of *Brachyurous Crustacea*.

Generic character. *Antennæ* small; *pedipalpi* with the exterior joints very large, foliaceous, and hairy; *thorax* suboval, truncate behind; legs hairy, simple; anterior with the base of the joint bent; forceps large; *abdomen* not terminated by a fin.

Type of the genus, *M. longicarpus*, Latreille. Native of the Indian Seas.

MYDAS, in *Zoology*, a genus of *Dipterous* insects.

Generic character. *Antennæ* porrected, five-jointed, with the two basal joints small, the following cylindric, the terminal one clavate, with an indistinct style at its extremity in a hollow; *proboscis* exerted; wings two.

Type of the genus, *M. filatus*, Fabricius; Degeer, vol. vi. pl. xxv. fig. 6. Many species, one only of which is European.

MYGALE, in *Zoology*, a genus of *Arachnoida*.

Generic character. *Palpi* projecting, pediform, inserted at the extremity of the jaws; mandibles robust, with their points bent downwards; jaws two, elongated; *labium* small, quadrate; eyes eight; body large; legs long, stout.

Type of the genus, *M. avicularia*, Latreille; Shaw, *Gen. Zool.* vol. vi. pl. 129. The species are of large

MYC-TERIA.

MYGALE.

MYGALE size, but not very numerous; they are said to build their nests of silky tubes or bags in holes in the ground, or in trees, and the type devours ants, and sometimes, it is affirmed, small birds; the latter inhabits South America.

MYGALE, from the Greek *μυογάλη*, a shrew, Cuv., Geoffr.; *Desman*. In *Zoology*, a genus of animals belonging to the family *Insectivora*, order *Sarcophaga*, class *Mammalia*.

Generic character. Incisive teeth, in the upper jaw two, sharp and triangular, in the lower four, long, narrow, and parallel, with truncated crowns, the middle two smaller than the outer; cuspid none; molar, in the upper jaw seven, in the lower four false on each side; in the upper three true pointed, in the lower six of the same on each side; the muzzle sharp, with a projecting, flattened, movable nose, having nostrils at its tip; eyes small; auricles deficient; body clothed with long hair; tail compressed; feet five-toed, webbed, plantigrade; the soles bare; hind feet hairy on their outer edge; claws falcular.

The individual animal on which this genus was founded was for a long time bandied between the Musquashes, Beavers, and Shrews, till shown by Cuvier, and more at length by Geoffroy, to possess distinct generic characters. The Desmans bear the same relation to the Shrews that the Musquashes do to the Campagnols, but are larger, and lead an aquatic life. The form of their skull rather approaches that of the Moles than the Shrews, in not terminating so pointedly; the nasal bones are much elongated, and the gristly part of the nose so much lengthened as to resemble a trunk, and is as movable as that of the Elephant; they have no auricle, which indicates, together with the webbing of the toes, their aquatic habits. The greater portion of their existence is spent in and under the water, and they never willingly get on land; but if they pass from one pond to another, it is only by subterranean canals, or by the ditches which connect them. They prefer pools, lakes, and other quiet waters, in the banks of which they form a burrow, the entrance from which is below the surface of the water, and immediately after they work slightly upwards, and form numerous windings to the extent of five or seven feet, so that only part of their habitation is under water; here they live either solitarily, or in pairs, according to the season. They never come to the surface of the water, except at pairing time, when they grow bold, sport upon the banks, and amuse themselves in scrambling among the rushes. They are thought to feed on the roots of the *Nymphaea*, and on sweet rush, but Pallas never found any thing in their stomach except the remains of larvæ and worms. As they do not become torpid in the Winter, they are much inconvenienced by the freezing of the water, and if there be any small apertures in the ice many may be seen anxiously striving to find room to breathe; if they cannot do this, they have only the air in their burrows to consume, and are soon suffocated. They possess a strong musky odour, to such extent, indeed, as to flavour those Pikes and Silures which prey on them.

M. Moscovitica, Geoffr.; *le Desman*, Buff.; *Musky Shrew* or *Long-nosed Beaver*, Pen.; *Russian Desman*. Length of the body eight inches, and of the tail six inches and three-quarters; the colour of the upper parts is dusky, and of the under parts white; the tail at its root is, as it were, constricted, but soon becomes cylindrical, and swells out like a bulbous root, but soon

diminishes, and gradually tapers to the tip, and as it diminishes in size, it becomes more and more flattened laterally; it is sparingly covered with scales, like the tail of the Beaver, and in the intervals between them there are a few short hairs. It is found in the Volga, and in the neighbouring lakes from Novogorod to Saratof. It feeds on the larvæ of water insects and leeches, which its long and flexible nose enables it readily to scoop out of the mud. Its fur is considered valuable, as, like that of the Beaver, it consists of long hairs, with a fine down at the roots. They are very common near Nizney Novogorod, and sold at the rate of a rouble a hundred. The skins are put into chests amongst clothes to preserve them from moth, and they are supposed to protect the wearers from infection.

M. Pyrenaica, Geoffr.; *Pyrenean Desman*. Four inches long, and the tail four and a half; all the upper parts of the body are chestnut-brown, the sides brownish-grey, and the belly silvery-grey; the tail is not at all constricted at its root, but gradually diminishing and cylindrical for three-fourths of its length, beyond which it is compressed laterally; it is covered with short hairs which lie close upon it; the claws are twice as long as in the preceding species; the front toes only half-webbed, and the outer hind toe also similarly loose. It was discovered by M. Desrouias, in the neighbourhood of Tarbes, at the foot of the Pyrenees.

See Geoffroy, *Annales du Musée*, vol. xvii; Cuvier, *Règne Animal*.

MYGINDA, in *Botany*, a genus of the class *Tetrandria*, order *Tetragynia*, natural order *Rhamn*. Generic character: calyx small, four-parted; corolla, petals four; stigmas two to four; seed-vessel a one-seeded globular drupe. Six species, natives of the West India Islands.

MYLABRIS, in *Zoology*, a genus of *Coleopterous* insects.

Generic character. *Antennæ* eleven-jointed, terminated by an arcuate mass, ending in a point; head large, heart-shaped; neck distinct; *thorax* subcordate; *elytra* flexible, deflexed, subrounded; *tarsi* heteromorous, with entire joints.

Type of the genus, *M. decempunctata*, Fabricius; Olivier, *Ent.* vol. iii. pl. i. fig. A; pl. ii. fig. 18. A rather numerous genus, frequenting temperate regions; none of the species are found in Britain.

MYLÆCHUS, in *Zoology*, a genus of *Coleopterous* insects.

Generic character. *Antennæ* incurved, rather shorter than the thorax, the two basal joints distinctly stouter than the following, cylindric; the third a little elongate, obconic, the three following least, the fourth being cylindric, the fifth and sixth somewhat transverse, the eighth, ninth, and tenth being nearly equal, and the eleventh largest, with its apex rounded; *palpi*, maxillary, with the basal joint subulate; labial with the terminal joint obtuse; *thorax* subtrapeziform; *tarsi* pentamerous, anterior in the male with the three first joints dilated; posterior *femora* of the male with a small triangular acute tooth beneath.

Type of the genus, *M. brunneus*, Latreille, *Genera Crust. et Ins.* vol. ii. pl. viii. fig. 11. One species only, which has been taken in Britain but very rarely.

MYLOCARIUM, in *Botany*, a genus of the class *Decandria*, order *Monogynia*. Generic character: calyx five-toothed; corolla, petals five, stigma three-angled, sessile, capsule superior, two or three-winged, three-celled; cells one-seeded, seed subulate.

MYGALE
—
MYLOCARIUM.

MYLOCA- One species, *M. ligustrinum*, a large evergreen shrub, native of North America.

MYODOCHA, in *Zoology*, a genus of *Hemipterous* insects.

Generic character. *Antennæ* slightly thickened towards their extremities, quadriarticulate; *rostrum* with four distinct joints; head ovoid, with a distinct neck; *tarsi* triarticulate, with the first joint elongate.

Type of the genus, *Cimex tipuloides*, Degeer, *Mémoires*, vol. v. pl. xxxv. fig. 18. One species, found in France, and it has been said also in England, but evidently without authority.

MYONIMA, in *Botany*, a genus of the class *Tetrandria*, order *Monogynia*. *Generic character*: calyx small, nearly entire; tube of the corolla short, border four-parted; seed-vessel a drupe, five-celled, cells four-seeded.

Two species, natives of the Isle of Bourbon.

MYOPA, in *Zoology*, a genus of *Dipterous* insects.

Generic character. *Antennæ* porrect, triarticulate, with the first joint cylindric, the second clavate, with the base compressed, the third globose, with a simple dorsal style; *stemma* three; *haustellum* exerted, filiform, elongate, geniculated at the base and in the middle; wings incumbent, parallel.

Type of the genus, *M. ferruginea*, Meigen, vol. iv. pl. xxxvii. fig. 11, 12. About twenty-five species, of which eight are found in Britain: they frequent flowers.

MYOPHONA, from the Greek *μύια*, a fly, and *φωνή*, a voice, Tem. In *Zoology*, a genus of animals belonging to the family *Conirostres*, order *Passeres*, class *Aves*.

Generic character. Beak very large, strong, and hard, furnished at the gape with some rough hairs, and little feathers turned forwards; nostrils oval and closed by a broad membrane; wings rounded and of moderate size; alar quills nearly equal, but the third the longest; tail rounded; *tarsi* very long.

There is but one species of this genus yet described by its founder,—

M. Metallicus, Tem.; *Metallic Myophone*. About twelve inches long; of a deep blue-black, and shining like steel; beak bright yellow; legs black. From Java.

See Temminck, *Planches Coloriées*.

MYOPORUM, in *Botany*, a genus of the class *Dydynamia*, order *Angiospermia*. *Generic character*: calyx five-parted; corolla bell-shaped; border spreading, rather unequal, five-parted; seed-vessel a drupe, one or two-seeded; nuts two-celled.

Four species, natives of Islands in the South Seas.

MYOPOTAMUS, from the Greek *μῦς*, a mouse, and *ποταμός*, a river; Commerson. *Coypu*, Molina. In *Zoology*, a genus of animals belonging to the family *Claviculata*, order *Rodentia*, class *Mammalia*.

Generic character. Head large, muzzle obtuse; ears small and rounded, incisive teeth large and tinged with yellow; molar compound, with flat crowns, four in each side in both jaws, and increasing in size from the first to the last; tail long, conical, strong, scaly, and slightly covered with hair: feet five-toed, the thumb of the fore feet very short, the other toes unconnected; hind feet webbed.

The single species of which this genus consists, very much resembles, in its general character, the Beavers, so that by some authors it has been included among them; it however differs remarkably in the conical form of the tail.

M. Bonariensis, Comm.; *le Coui*, Geoff.; *Coypu*, Mol. In size equal to the Otter; the back chestnut-

VOL. XXV.

brown, sides ferruginous, and belly light brown. It lives in burrows on the banks of rivers, and swims well; it also frequents houses; is easily tamed, attaches itself to those who treat it kindly, and is content when domesticated; when abused it utters a peculiar, shrill cry. It is found throughout the greater part of South America; and its fur, which is called *Raconda*, is used for making hats.

See Cuvier, *Regne Animal*; Pennant, *History of Quadrupeds*.

MYOSCHILOS, in *Botany*, a genus of the class *Pentandria*, order *Monogynia*. *Generic character*: calyx five-leaved, coloured; corolla none; stamens inserted into the receptacle; stigma two or three cleft; drupe one-seeded, crowned by the calyx; nut one-celled.

One species, *M. oblonga*, a native of Chili. An infusion of the leaves is used by the natives; it possesses similar medicinal properties to Senna.

MYOSERIS, in *Botany*, a genus of the class *Syngenesia*, order *Æqualis*, natural order *Compositæ*. *Generic character*: receptacle chaffy, chaff capillary; involucre cup-shaped; down hairy, sessile.

One species, *M. purpurea*, native of Tauria.

MYOSOTIS, in *Botany*, a genus of the class *Pentandria*, order *Monogynia*, natural order *Boraginæ*. *Generic character*: calyx five-cleft; corolla salver-shaped, five-cleft, slightly emarginate; mouth of the tube closed with five convex, conniving scales; seeds smooth or spiny.

More than twenty species, mostly natives of Europe.

M. arvensis, *M. scorpioides*, *M. rupicola*, and *M. palustris*, (an elegant little plant with light blue flowers, generally known as the "Forget me not,") are natives of England.

MYOSURUS, in *Botany*, a genus of the class *Pentandria*, order *Polygynia*, natural order *Ranunculaceæ*. *Generic character*: calyx five-leaved, deciduous, each leaf with a spur at the base; petals, or rather nectaries, five, consisting of a nectariferous claw with a spreading, lanceolate border, seeds numerous.

The only species is *M. minimus*, a native of England. *Eng. Bot.* 435.

MYOTHERA, from the Greek *μύια*, a fly, and *θηράω*, I hunt, Illig., Tem.; *Palikour*. In *Zoology*, a genus of animals belonging to the family *Dentirostres*, order *Passeres*, class *Aves*.

Generic character. Beak long, conical, straight, strongish, convex above; ridge slightly convex, point suddenly curved, notched, longer than the lower, which is straight, conical, and slightly elevated towards the tip: nostrils basal, lateral, partially closed by membrane; legs long or moderate, slender; lateral toes equal, the inner connected as far as the first joint, the outer only at its base; wings short and much rounded; the first three quills equally graduated, fourth and fifth the longest; tail short and equal, or long and graduated.

The principal characters of this genus consist in the length of the legs and the shortness of the tail, which distinguishes it from the Thrushes, whence the genus was originally taken by Illiger. The form of their beak varies much; in some it is thick and arched, in others straighter, and in some it is slender and pointed: as to the general form of this organ, it allies them to the Shrikes, but its comparative slenderness restricts them to insect food. Cuvier differs from Temminck in confining the genus only to such individuals as have the tail very short. The Palikours, the

MYOTHE-
RA.

common title by which these birds go in Guiana, do not fly much on account of the shortness of their wings, but they run or hop along the trees with great quickness. They are found in South America and in Java, in the depths of retired woods in the neighbourhood of large ant-hills, on whose tenants they principally feed. Their nests, which are hemispherical, consist of dried grass closely interwoven, and from two to four inches in diameter, which are suspended by two sides to shrubs about two or three feet from the ground, and in them are deposited three or four roundish eggs. The natives of Guiana call them Palikours, and the colonists Little Partridges.

M. Grallaria, Illig.; *Turdus Rex*, Gmel.; *Corvus Grallarius*, Shaw; *le Roi des Fourmiliers*, Buff.; *King of the Palikours*. About seven or eight inches long, and about the size of a Quail; beak strong, rather more than an inch in length, and nearly half an inch thick at its base; upper mandible convex and notched; around the legs a narrow, featherless garter; wings, when folded, reaching to the tip of the tail; upper parts of the body brownish-red, clouded with blackish and light brown; throat and front of the neck sombre brown; from the corners of the mouth a white, triangular streak passes on each side of the neck, and on the chest there is a patch of the same colour; belly and rump whitish-red; beak and legs brown. Of this species Vieillot has made his genus *Grallaria*. This bird is found in Guiana and the Brazils, living solitarily in the vicinity of the large ant-hills, on the inhabitants of which it feeds: it builds its nest in bushes, and lays three eggs. It is the rarest of the genus, and is called King of the Anteaters by the inhabitants of Cayenne, on account of its size, and because it seems to be master over the other species.

M. Tinniens, Illig.; *Turdus Tinniens*, Gmel.; *le Grand Bêfroi*, Buff.; *Alarm Palikour*. About six inches and a half long; tail short, and extending half an inch beyond the wings; upper mandible slightly notched and hooked, of the same length as the lower; upper part of the body pale brown, under parts white, the feathers of the chest edged with grey; tarsi and toes leaden; beak black above and whitish beneath. Native of Cayenne, in the mountainous and woody districts of which it may be heard morning and evening singing in a very loud note, which much resembles the repeated strokes of an alarm bell, for the space of an hour.

M. Colma, Tem., Cuv.; *Turdus Colma*, Gmel.; *le Colma et Tétéma*, Buff.; *Spotted-necked Palikour*. About seven inches long; upper parts brown, and beneath brown mingled with grey; throat white spotted with grey, on the back of the neck a reddish transverse stripe. Buffon considers the Tétéma to be merely a variety of the Colma without the spots on the neck, or, perhaps, that it is the male, the Colma being the female of the same species.

M. Formicivora, Tem. Cuv.; *Turdus Formicivorus*, Gmel.; *le Fourmilier Palikour*, Buff.; *Common Palikour*. Six inches long, about the size of a Lark; the grey-brown feathers covering the head and upper part of the body have a reddish edge, except on the middle of the back where is an oblong, black spot; bend of the wing white, middle coverts brown, surrounded with reddish, great coverts black edged with yellowish-white, forming a transverse band of that colour on the wing; throat, neck, and front of the chest black; cheeks white spotted with grey, and extending from them on each side a similar white streak, which diminishes as it descends,

and surrounds the black throat, neck, and chest; belly cinereous, ocular circle blue; tail rufous. Native of the forests of Guiana. It is very nimble, but does not fly any distance, and has much of the manners of the Creepers, climbing up the trunks of trees, and supporting itself with its outspread tail; its tremulous note is occasionally broken by a short, shrill cry. It builds a better nest than either of the other species, covers it externally with moss, and deposits in it eggs about the size of Sparrows' eggs, of a brown colour, and spotted at the broader end.

M. Lineata, Cuv.; *Turdus Lineatus*, Gmel.; *le petit Bêfroi*, Buff.; *Speckled Palikour*. About five and a half inches long; the tail reaching nearly an inch beyond the wings; upper part of the body olive, lighter on the rump; alar and caudal quills brown; throat white; chest and belly grey, spotted with reddish-brown; wing-coverts marked with the same; beak and legs dusky. Native of Cayenne.

M. Aurita, Tem.; *Turdus Auritus*, Lath.; *le Fourmilier à Oreille Blanche*, Buff.; *White-eared Palikour*. About four inches and three-quarters in length, the tail not quite half an inch; the top of the head brown, the sides and throat black; from the angle of the eye on each side descends a white streak to the sides of the neck; upper parts of the body olive and reddish intermingled; under parts rufous and grey. From Cayenne.

M. Nævia, Tem.; *Pipra Nævia*, Lath.; *le Fourmilier Tacheté de Cayenne*, Buff.; *Spotted Palikour*. About four inches long; upper parts of the body, wings, and tail brown; breast spotted with black; the wings marked with two white bands, the tail tipped with the same; throat black, chest white; abdominal and anal regions orange. South America. Of this and the preceding species, Vieillot forms his genus *Conopophagus*.

M. Albifrons, Tem.; *Pipra Albifrons*, Lath.; *le Plumet Blanc*, Buff.; *White-faced Palikour*. From five to six inches in length; head furnished with a white crest; face and throat surrounded with a white line; neck, middle of back, and wings cinereous inclining to black; other parts of the body and tail cinnamon inclining to orange. From Cayenne.

M. Surinamensis, Tem.; *Sitta Nævia*, Gmel.; *la Sittelle Grivelée*, Buff.; *Surinam Palikour*. Six inches long; head leaden-blue; throat white; upper parts leaden, under glaucous; wing-coverts dotted with white above; legs dusky. From Surinam.

M. Andromeda, Tem.; *Andromeda Palikour*. About the size of a Thrush, six inches in length; ocular circle naked, auricles spotted with black and white; of a uniform bluish-brown above with black crescents on the tips of the feathers; wings olive-brown; chest grey; middle of the belly white; sides grey edged with deep black; beak black; legs brown. From Java and Sumatra.

M. Capistrata, Tem.; *Bridled Palikour*. Five and a half inches long; head black; above each eye an orange stripe; cheeks brownish; on the throat a blue streak; chest bright tawny; other parts tawny-brown. From Java.

M. Melanothorax, Tem.; *Blackbreasted Palikour*. Five inches long; tawny-brown above; wings rufous, and marked with a white spot; cheeks and throat white; sides of the neck spotted with black; at the top of the chest a black band; belly tawny. From Java. The two preceding species Cuvier thinks belong to the Thrushes, as also the three following.

MYOTHE-
RA.

MYOTHE-
RA. *M. Malura*, Natterer; *White-tailed Palikour*. Length five and a half inches; tail long and graduated; beak slender; general colour brownish, spotted with black; upper part of the wings marked with three white stripes; belly cinereous-olive; in the female, the upper part of the body is olive and reddish streaked with black. From the Brazils.

M. Rufimarginata, Tem.; *Red-winged Palikour*. In the male the head is brownish-ash, with a streak above the eyes; cheeks and throat light grey; upper parts olive, under yellowish; wings brown, the coverts tipped with white, the quills light chestnut; tail graduated, the quills brown, with white outer edges and tips; in the female the head is rufous. Brazil.

M. Ferruginea, Tem.; *Chestnut Palikour*. Five inches long; the top of the head bright black, crossed with a white stripe; forehead and beneath the eyes white; back reddish-brown; all the body of a more or less reddish-ochrous colour; wings brown, the quills tipped with white; tail graduated, caudal quills black tipped with white. From the Brazils.

M. Mentalis, Tem.; *Gorgetted Palikour*. Four inches long; greenish-brown above, yellowish beneath. From the Brazils. The two preceding Cuvier considers to belong rather to the Shrikes.

The *Myothera Novæ Zelandiæ* of Lesson is a Flycatcher. Besides these, there are several other new species.

See Illiger, *Prodromus Avium*; Cuvier, *Règne Animal*; Temminck, *Manuel d'Ornithologie*, and *Planches Coloriées*; Latham, *General Synopsis of Birds*.

MYOXUS, from the Greek *μῦς*, a mouse, and *ὄξυς*, sharp, Schreber; *Dormouse*, Pen. In *Zoology*, a genus of animals belonging to the family *Claviculata*, order *Rodentia*, class *Mammalia*.

Generic character. Incisive teeth two in each jaw; the upper broadish and not grooved, the lower narrow and much sharper; molar teeth four on a side in each jaw, with distinct fangs and crowns marked with two kinds of transverse ridges by a double line of enamel; nose sharp; ears of moderate size; tail long, sometimes very hairy and round, at other times flattened horizontally, and the hairs standing out on the sides like the webs of a feather, and sometimes tufted at the tip; feet four-toed in front, with a rudimental thumb, five-toed behind; claws falcular.

The Dormice are of an elegant form, and much resemble the *Mures* in their appearance. They feed on all kinds of fruit, and climb trees with great facility in search of them. During the greater part of the day they sleep, and come out only at night. Having stored their holes with nuts, acorns, chestnuts, corn, &c., they fall asleep on the approach of cold weather, and remain torpid during the Winter, except occasionally waking to feed, after which they soon fall asleep again. They are found both in Europe and America, and seem to form the intermediate link between Rats and Squirrels.

M. Glis, Schreb.; *Sciurus Glis*, Lin.; *le Loir*, Buff.; *Fat Dormouse*, Pen. About the size of a Rat, and covered with soft hair; ears large, oval, and nearly bare; eyes very prominent, and edged with black; whiskers black and two inches long; upper part and sides of the head, neck, and back, the outer surface of the limbs, and the tail almost completely grey, and mingled with black and silvery; the hairs of these parts being at their lower half cinereous, and the remaining portion in some being very bright grey to their tip, and in others grey

with black tips; under parts, insides of the limbs and feet white, tinged with tawny, and some few hairs silvery; under surface of the tail also whitish. It is found in the South-Western parts of Russia, Germany, Southern France, Switzerland, Italy and Greece, but not in cold climates; it lives in the forests, climbs trees with great facility, and springs readily from branch to branch. It feeds on acorns, chestnuts, walnuts, &c., and it is said also on eggs, and even on small birds. It builds its nest in the hollows of trees and in the chinks of rocks, and brings four or five young at a birth. It becomes completely torpid at five degrees below zero, and remains asleep during the whole Winter. Pennant states that during this time it grows very fat, which must be a mistake, as it would oppose the regular law governing hybernating animals; his only authority is Martial's *Epigram*, book xiii. ep. 59.

*Tota mihi dormitur hyems, et pinguior illo
Tempore sum, quo me nil nisi somnus alit.*

This Dormouse was considered a delicacy by the Roman gourmands, who had their *Gliralia*, or feeding places, for the purpose of fattening them properly.

The *M. Dryas* of Schreber is considered by Cuvier to be the same species as the last.

M. Nitela, Gmel.; *Mus Quercinus*, Lin.; *le Lerot*, Buff.; *Garden Dormouse*, Pen. About an inch shorter than the last; the eyes surrounded with a large black circle reaching to the ears, which are longer than those of the Fat Dormouse, and the nose rather more pointed; behind the ear a black spot, and before it a little yellowish-white one; the upper parts of the body, and outside of the limbs, tawny-grey, becoming lighter on the sides; throat and whole under surface tawny-white; tail covered with hairs, at first short, but increasing in length towards the tip, all of it black, except the tip, which is white. Is found in France and the South of Europe, in Poland and Prussia, in the gardens, and sometimes in houses; feeds on pulpy fruits, such as peaches, apricots, apples, pears, &c., and also on nuts, peas, and beans, which it stores up in its nest built in holes of walls or hollow trees. It brings five or six young at a birth. During the Winter they collect in parties of eight or ten, and sleep together in the midst of their food.

M. Avellanarius, Gmel.; *le Muscardin*, Buff.; *Common Dormouse*, Pen. About the size of a Mouse; head broader, nose sharper, eyes larger, and ears shorter than either of the preceding; ears round and naked, eyes full and black; the upper parts light tawny and flaxen coloured; belly and under part of the head yellowish; throat nearly white; tail flattened, the hairs being placed on the sides similarly to the barbs of a feather, and of a dusky red colour. This is the only species found in England; it inhabits Europe generally so far as Sweden. It lives in the hedges, makes its nest in a hollow tree near the bottom, or in a thick bush, consisting of grass woven together and of a round form, with a conical aperture at top. It brings three or four young, which soon quit the nest for habitations of their own; here they deposit their store of nuts, and coiling themselves up like a ball, pass the Winter in a torpid state. When feeding, they sit up and hold their food like a Squirrel.

M. Virginicus, Reich; *Virginian Dormouse*. Same size as the last; head long, flattened, nose sharpish; whiskers numerous, of unequal length, the shorter ferruginous, the longer yellow at the base with dusky or

MYOXUS. black tips; ears large and oval, transparent and naked at the lower part, covered above with thick yellow hair; upper parts dusky rufous, under hoary. From the foot of the Alleghany Mountains.

—
**MYRIAN-
THUS.**

M. Murinus, Desm.; *Murine Dormouse*. Rather larger than the Common Dormouse; the fur of a complete mouse-colour, lighter beneath than above, the tips of the hairs on the belly being whitish; tail as long as the body, and flattened horizontally, the hairs placed symmetrically on each side. From the Cape of Good Hope.

M. Coupeii, F. Cuv.; *Lecoupe's Dormouse*. About same size; upper part of the body and tail pale yellow; belly white; tail very hairy. Perhaps only a variety of the preceding. From Senegal.

M. Cattoirii, F. Cuv.; *Lecattoire's Dormouse*. About as large as the Fat Dormouse; upper parts hoar-dusky, under whitish-red; above the eye a broad black stripe; tail short and covered with very thick, long hairs. From Senegal.

M. Lineatus, Siebold; *Striped Dormouse*. Six inches and a half long; the tail four and a half; the back is marked with five longitudinal stripes. From the Island of Jesso.

Besides these, several other species are mentioned which require confirmation. Perhaps the *Mus Frugivorus*, and *Dichrurus*, mentioned by Rafinesque, Smaltz, and already described in the genus *Mus*, belong to the Dormice, but the structure of their teeth must be ascertained before this can be decided.

Shaw mentions another species, *M. Africanus*, the *Earless Dormouse* of Pennant, but its cleft upper lip, its very flat head and obtuse nose make it probable, that it belongs to the Squirrels.

A fossil species has been found in the limestone formation of Paris, which Cuvier calls the *M. Spelæus*, and is about the size of the Common Dormouse.

See Schreber, *Säugethiere*; Linnæi *Systema Naturæ* a Gmelin; Cuvier, *Règne Animal*; Pennant, *History of Quadrupeds*.

MYRIAD, Fr. *myriade*; Lat. *myrias*; Gr. *μυριάς*, which nearly corresponds with the Lat. *infinitus*, or *sexcentum*, and is used for any number that cannot easily be counted. Lennep.

But O how fall'n! How chang'd
From him, who in the happy realms of light
Cloth'd with transcendent brightness didst outshine
Myriads though bright.

Milton. *Paradise Lost*, book i. l. 57.

How came the transactions of so many *myriads* of years [eternity] to be swallowed up in such deep silence and oblivion?

South. *Sermons*, vol. ix. p. 89.

His lofty stature, where a *myriad* shine,
O'ertops and speaks a majesty divine.

Parnell. *The Gift of Poetry*.

MYRIADENUS, in *Botany*, a genus of the class *Diadelphia*, order *Decandria*, natural order *Leguminosæ*. Generic character: calyx five-toothed, hid between the bracteal leaves; joints of the pod round, numerous, one-seeded, not bursting.

One species, *M. tetraphyllus*, native of Jamaica. Decandolle.

MYRIANTHUS, in *Botany*, a genus of the class *Monoecia*, order *Monadelphia*. Generic character: male flower, calyx, four-parted, segments concave; no corolla; filaments cylindrical, the apex three-parted,

anthers three: female flower, berry inferior, twelve or fourteen celled; margin of the seeds winged.

One species, *M. arborea*, native of Africa.

MYRIASPORA, in *Botany*, a genus of the class *Decandria*, order *Monogynia*, natural order *Melastomaceæ*. Generic character: calyx very hispid, tube ovate, border bursting into five broad irregular lobes; anthers gibbous at the base; style filiform, seed-vessel an ovate globular berry, five-celled, seeds numerous.

Two species, natives of Brazil. Decandolle.

MYRICA, in *Botany*, a genus of the class *Dioecia*, order *Tetrandria*, natural order *Rhamnii*. Generic character: male flower, a catkin with concave scales; no corolla: female flower as the male; styles two, berry one-seeded.

Nine species, natives of both hemispheres. The most interesting is *M. Gale*, a native of England; it is an elegant shrub, growing in boggy situations; the fruit and leaves are very fragrant.

MYRICARIA, in *Botany*, a genus of the class *Decandria*, order *Monogynia*, natural order *Tamariscinæ*, Decandolle. Generic character: calyx five-parted; corolla, petals five; stamens alternately short; style very short, seeds with a plumose apex.

Five species, natives of Europe. Decandolle.

MYRIOPHYLLUM, in *Botany*, a genus of the class *Monoecia*, order *Polyandria*, natural order *Holoragææ*. Generic character: male flower, calyx four-leaved; corolla, petals four; stamens eight: female flower as the male; pistils four; style none; seeds four, naked; flowers in axillary whorls.

Six species, natives of watery places in both hemispheres. *M. spicatum* and *M. verticillatum* are natives of England.

MYRISTICA, in *Botany*, a genus of the class *Dioecia*, order *Monadelphia*, natural order *Lauri*. Generic character: male flower, calyx none; corolla bell-shaped, three-cleft; filaments columnar; anthers six to ten, connate: female flower as the male; style none; stigmas two; seed-vessel a drupe; nut arillate; one-seeded; seed large.

A genus containing about ten species, natives of the East and West Indies. The most remarkable is *M. moschata*, a tree with smooth, oblong, pointed leaves, producing the aromatic nutmeg, which is the seed of the tree: it is a native of the Moluccas.

MYRMECIA, in *Botany*, a genus of the class *Tetrandria*, order *Monogynia*, natural order *Gentianæ*. Generic character: calyx bell-shaped, five-toothed; corolla tubular, throat inflated; five glandules surrounding the base of the germen; capsule two-celled, two-valved, many seeded.

One species, *M. scandens*, native of the woods of Guiana. The cavities of the trunk and branches are usually filled with ants.

MYRMECINA, in *Zoology*, a genus of *Hymenopterous* insects.

Generic character. *Antennæ* remote, geniculated, hairy, thirteen-jointed, the basal joint short, as long again as the second, which is subglobose, third and following oblong, terminal joint the longest, elongate-conic; *labrum* large, notched anteriorly; mandibles wanting; *maxillæ* dilated; *palpi* four-jointed; labial *palpi* tri-articulate; wings four, with the marginal cell of the superior pedicled; legs long.

Type of the genus, *M. Latreillii*, Curtis, *Britt. Ent.* pl. 265. One species, a native of Britain.

MYRIAN-
THUS.

—
MYRME-
CINA.

MYRME- MYRMECODES, in Zoology, a genus of Hyme-
CODES. nopterous insects.

MYR-
MECO-
PHAGA.

Generic character. *Antennæ* slender, rather longer than the head, which is rounded; mandibles porrected, arcuate, without teeth; *palpi* very short, three or four jointed, the terminal joint obsolete; maxillary *palpi* stouter, scarcely visible, somewhat conic, labial cylindric; *thorax* elongate-cubic, a little narrowed behind, composed of three segments, the first segment receiving the second.

Type of the genus, *Tiphia pedestris*, Fabricius. Inhabits Australasia.

MYRMECOPHAGA, from the Greek *μύρμηξ*, an ant, and *φάγω*, I eat, Lin.; *Anteater*, Pen. In Zoology, a genus of animals belonging to the family *Vermilinguia*, order *Edentata*, class *Mammalia*.

Generic character. No teeth of any kind; head not broader than the neck; nose much elongated and roundish; mouth very narrow; tongue very long, roundish, and projectile; body covered with coarse hair; tail of moderate length, in some species prehensile; fore legs longer and stronger than hind legs, which have four or five toes, whilst the former have only two or four, but all are connected with each other as far as the claws, which are falcular, and those of the fore legs very large.

The Anteaters are remarkable for the extremely small size of their mouth, and the total absence of teeth; their tongue is very long and taper, and can be darted from the mouth to a considerable extent; it is covered with a quantity of stiff, glutinous secretion, and when thrust into an Ant's nest, these animals become entangled in it, and the organ is then retracted into the Anteater's mouth. The tail is in some species clothed with long hairs throughout, but in others it is bare towards the tip, and prehensile. Their claws are very long and curved, and well adapted for tearing up the ground or covering of the nests which they seek to rob; but in walking, they are folded into the soles of the feet against a large callosity, and the animal does not walk on the sole, but on the outside of the foot. Their motions are very slow; some of them live entirely on the ground, whilst others climb trees, in which their prehensile tail very much assists them. They feed entirely on Ants and Termites; bring only a single young one at a birth, which they carry about on their backs; and are found only in America.

M. Jubata, Lin.; *le Tamanoir*, Buff.; *Great Anteater*, Pen. Length from the nose to the root of the tail four feet, the tail itself three feet; legs short and thick, the toes only distinguished by the large, sharp, and crooked claws with which they are armed, and which are doubled obliquely downwards when at rest; the head is very thin and taper, the mouth extremely small, being hardly more than an inch wide; the nostrils very close, and in shape resembling the letter C; the eyes rather small, deep set, and the lids not furnished with lashes; the ears small and round; the hair on the head very short, but on the body from two to three inches long, as stiff as hog's bristles, and collected into a kind of mane on the ridge of the back, to the extent of six or eight inches; tail round, covered with very large and crisp hairs from twelve to eighteen inches in length, and falling vertically on either side like a plume of feathers. The general colour of the head is grey and brown; of the upper part of the body and tail brown mingled with dingy white; an oblique streak of black edged with white arises from the chest on each side, passes over the shoulders to the loins, and gradually

diminishes in breadth as it passes backwards; chest and belly deep brown, inclining to black; the fore legs dingy grey mingled with brown, with one spot of black on the tarsus and another on the toes; hind legs nearly black. The Great Anteater inhabits Brazil, Peru, and Guiana; it lives solitarily, except at breeding time, and brings but one at a birth; it runs slowly, and swims over large rivers, at which time it flings its tail over its back, as it does also when caught in the rain, of which it is afraid. It feeds on Ants, and Dampier, who calls it the *Ant Bear*, says, "It lays its nose down flat on the ground, close by the path that the Ants travel in, (whereof here are many in this Country,) and then puts out his tongue athwart the path; the Ants passing forwards and backwards continually, when they come to the tongue make a stop, and in two or three minutes' time it will be covered all over with Ants; which she perceiving, draws in her tongue, and then eats them; and often puts it out again to trepan more." Its only means of defence consist in hugging its enemy, for which purpose, when attacked, it prepares for the combat by sitting up on its haunches. Like the Sloth, when it has once laid hold of its opponent, it fastens its long claws into it, and retains it till life is extinct; and in this way it is said to be a match even for the very Panthers of America. The flesh of this Anteater, although having a strong taste, is eaten by the Indians.

M. Tetradactyla, Lin.; *le Tamandua*, Buff.; *Middle Anteater*, Pen. The body of this species is about a foot in length, and the tail sixteen inches, and although it has generally the same form as the preceding, it is distinguished from it by the tail being naked towards its tip, and prehensile. It is covered with short, woolly, and shining hair of a greyish-yellow colour, becoming dusky on the ridge of the back, and on the hind legs; a black line passes from each side of the neck across the shoulders, and meets at the lower part of the back; from each corner of the mouth a brown streak passes, which encircles the eyes. It is found in the same districts as the last, and suspends itself by the tail to the branches of trees; its young are also said to attach themselves to this organ. The *M. Tridactyla* of Seba is merely a mutilated specimen of this species.

M. Nigra, Geoff.; *Black Anteater*. This species has the claws very powerful; the hair short and black throughout, excepting the tail, the root of which is covered with yellowish hair, and about two-fifths of it naked. From Paraguay.

M. Bivittata, Geoff.; *Double-striped Anteater*. Of a greyish-yellow colour, with an oblique, triangular band on each shoulder, inclining towards the ridge of the back; the head covered with short, yellow hair; and from the eye to the nose proceed two bare, dusky stripes. This and the preceding species are considered by Desmarest as merely varieties of the *M. Tetradactyla*.

M. Didactyla, Lin.; *le Fourmilier à deux Doigts*, Buff.; *Lest Anteater*, Pen. About the size of a Rat, the body being six inches, and the tail seven in length; the fore feet have but two claws each, of which the outer is very large; on the hind feet there are four; the tail is prehensile; the muzzle not so much lengthened as in the other species, and slightly bent downwards; the hair is long, soft, and silky, or rather woolly, and of a yellowish-brown colour; in some there is a lightly marked rufous line extending along the ridge of the back. It is found in Guiana, living continually in the trees, where it hunts

MECO-
PHAGA.

MYR-
MECO-
PHAGA.
—
MYROBA-
LANE.

out the Termites' nests and other insects from under the dead bark.

M. Annulata, Desmarest; *Ringed Anteater*. This species is known only from a plate in Krusenstern's *Voyage*; its nose is much elongated, like a proboscis; the general colour brown, but deeper on the tip of the nose and the paws; the cheeks lighter, with a long, triangular, brown spot which includes the eye; the tail tawny, shorter than the body, and marked with eleven blackish-brown wings. From Brazil.

See Linnæi *Systema Naturæ* a Gmelin; Cuvier, *Règne Animal*; Pennant, *History of Quadrupeds*.

MYRMELEON, in *Zoology*, a genus of *Neuropterous* insects.

Generic character. *Antennæ* shorter than the body, somewhat gradually thickening towards their extremities, arcuated, and furnished at the tips with a distinct little point; *palpi* six; labial longest, somewhat thicker at their extremities; eyes undivided; *abdomen* very long, linear; trunk short, villose; *tibiæ* hairy, terminated by two strong spurs; *tarsi* five-jointed.

Type of the genus, *M. formicarium*, Linnæus; Stewart, vol. ii. pl. viii. fig. 12—15. Several species, of which one is said to inhabit Britain.

Reaumur and Roësel have given admirable details of the economy of the insects of this genus: they feed on other insects in all their states, catching some flying like the *Libellulæ*; they deposit their eggs in sandy places, and the larvæ, when hatched, form an ingenious snare for the purpose of capturing their prey, as prettily represented in the Works of the authors above referred to.

MYRMICA, in *Zoology*, a genus of *Hymenopterous* insects.

Generic character. *Antennæ* entirely exerted, slightly thickened towards their extremities, the basal joint very long; maxillary *palpi* long, six-jointed; *labrum* large, horny; mandibles trigonate, more or less elongate; peduncle of the abdomen of two knots; wings four or more; neuters and females armed with stings.

Type of the genus, *M. subterranea*, Latreille, *Hist. Form.* 219. pl. x. fig. 64; pl. xi. fig. 70. Several species, eight of which are British.

MYRMOSA, in *Zoology*, a genus of *Hymenopterous* insects.

Generic character. *Antennæ* much longer than the head, the first joint not receiving the second; mandibles tridentate; maxillary *palpi* as large again as the maxillæ, six-jointed; labial short, four-jointed; *thorax* composed of two segments, the anterior segment transverse; *abdomen* depressed, elliptic in the males, conic in the females; the first segment nodiform; anterior wings with three submarginal areolets.

Type of the genus, *M. melanocephala*, Latreille, *Gen. Crust. et Ins.* vol. i. pl. xiii. fig. 6.

Several European species, of which one inhabits Britain.

MYROBALANE is somewhat too briefly explained by Gifford, in a note upon a passage in Ben Jonson's *Alchemist*. Subtle has just tasted Dame Pliant's lips, and is so well pleased, that he kisses her again, exclaiming,

— slight! she melts
Like a Myrobalane.

Upon this word the Commentator remarks, "A foreign conserve. Cotgrave informs us that it was 'a dried plum brought from the Indies,' or rather perhaps from the Levant. It is frequently mentioned by our

old Dramatists, and seems to have been in high estimation as a sweetmeat."

The *μυροβάλανος* of Dioscorides is fully noticed as follows by Pliny: "As for Myrobalanon, (i. Behen,) it groweth ordinarily in the regions of the Troglodytes, about Thebais, and that part of Arabia which divideth Jury from Egypt, a drugge that Nature hath brought forth onely for ointement, as the very name giveth it. Whereby it appeareth also, that it is a very nut of a certaine tree, which beareth leaves like to *Heliotropium*: whereof we will speake among other hearbs. The fruit that this plant beareth, is about the bigness of a filberd nut. That which groweth in Arabia, and yet called Syriaca, is white: but contrariwise that about Thebais is blacke. The former of these two is commended, for the goodness of the oile which is pressed out of it: but the Thebaick Ben is in greater request for the plentie that it yeeldeth. As for the Troglodyticke, it is the worst of all, and the cheapest. And yet some there be, who prefer the Ethiopian Ben before all other. The nut or fruite thereof, is black and fat, with a small and tender kernell within: howbeit the liquor pressed forth of it is more odoriferous: and it groweth in champion countries and plains. It is affirmed moreover that the Egyptian Ben is more oleous and fat, having a thicker shell, and the same red. And albeit that it grow in marish grounds, yet it is a shorter plant, and more drie than the others. But contrariwise they say that the Arabicke is greene of colour, and thinner in substance: and for that it groweth upon the mountaines, it is more massie and weightie. But the best simply by many degrees, is that Ben which is called Petrea, comming from the towne abouesaide, with a blackish rind and white kernell. Now the Perfumers and Apothecaries doe presse onely the huskes and shells; but the Physicians extract an oile out of the verie kernells, which as they stampe, they pour hot water ever and anon unto it by little and little." xii. 21.

The Myrobalane of the Ancients, therefore, does not appear to have been eaten as a sweetmeat, and from its description by the Moderns, it seems to be an odd taste which could so employ it. But our forefathers even in their delicacies were but foul feeders. There are five kinds, all astringent and tonic, as the Medical Writers say, but with an unpleasant, bitterish, austere flavour, like unripe service-berries; which, unless Subtle was a very different judge of such matters from that which we imagine him to have been, very little resembled Dame Pliant's kisses.

Archdeacon Nares gives the word as frequently written *Marablane*. "In conserves, candies, marmalades, sinkados, ponados, marablane, &c.:" (Ford's *Sun's Darling*, ii. 1.) and we do not quite understand him when he adds that the English Physicians *confounded* it with behen. Surely from Pliny's account they are the same thing, the kernels being used in medicine and perfumery, the fruit as a conserve. The following is the receipt for its preparation, which Mr. Nares adds from Warner's *Antiquitates Culinarie*, p. 92.

"To preserve Mirabolans, or Mala-cadonians. Take your Mala-cadonians, stone them, perboyle in water, then pill off the outward skin of them; they will boyle as long as a peece of beefe, and therefore you need not feere the breaking of them; and when they are boyled tender, make sirup of them, and preserve them as you do any other thing, and so you may keepe them all the yeare."

MYROBA-
LANE.

MYRO-
DEN-
DRUM.MYR-
RHINE.

MYRODENDRUM, in *Botany*, a genus of the class *Polyandria*, order *Monogynia*. Generic character: calyx five-toothed; corolla, petals five; stigma five-lobed; seed-vessel five-celled, cells one-seeded.

One species, *M. amplexicaule*, native of Cayenne.

MYRODIA, in *Botany*, a genus of the class *Monadelphia*, order *Polyandria*, natural order *Malvaceæ*. Generic character: calyx simple, tubular, bursting; corolla, petals five; style filiform; seed-vessel a dried berry, two or three celled, cells one-seeded.

Two species, natives of Africa and the Carribee Islands.

MYROSMA, in *Botany*, a genus of the class *Monandria*, order *Monogynia*, natural order *Scitamineæ*. Generic character: calyx double, the exterior three-leaved, interior three-parted; capsule three-angled, three-celled, many seeded.

One species, *M. cannaformis*, native of Surinam.

MYROSPERMUM, in *Botany*, a genus of the class *Decandria*, order *Monogynia*, natural order *Leguminosæ*. Generic character: calyx bell-shaped, five-toothed, persisting; corolla, petals five, the upper petal large; footstalk of the pod at the base naked, the upper part broadly winged.

Four species, natives of South America.

MYROXOLON, in *Botany*, a genus of the class *Decandria*, order *Monogynia*, natural order *Leguminosæ*. Generic character: calyx bell-shaped, five-toothed; corolla, petals five, the upper petal large, germen longer than the corolla, pod with one seed at the apex.

Three species, fine trees, producing balsam, natives of Peru.

MYRRH, Fr. *myrrhe*; It. and Sp. *mirra*; Lat. *myrrha*; Gr. *μύρρα*; of Eastern origin, and deriving its name from its bitter taste.

And thei ghaven to him to drinke wyn medled with *myrrhe*, and he took not. *Wiclif. Mark, ch. xv.*

Some have written, that the trees which beare the *myrrhe* doe grow confusedly here and there in the same woods among the incense trees; but more there are who affirme, that they grow apart by themselves. And in truth, found they are in many quarters of Arabia. *Holland. Plinie, book xxv. ch. xv.*

Where sweet *myrrh-breathing* Zephyr in the Spring,
Gently distills his nectar-dropping showers

Drayton. Idea 53. To the River Ankor.

Saint Marke calls this draught *οἶνον ἱσχυρὸν καὶ μύρρον*, *myrrhe-wine*, mingled (as is like) with other ingredients.

Hall. Works, vol. i. fol. 389. The Passion Sermon.

Upon the precious MYRRHINE drinking vessels of the Ancients, *Murrhina*, *Myrrhina*, *Murraea*, *Murrea*, *Myrrhea*,) be they what they may, for a decision has not yet been obtained, more Volumes have been written than we feel inclination to quote. The safest way will be in the first instance to hear what Pliny says concerning them. "But to returne unto the Triumph of Pompey: this victorie of his, brought into Rome first our cups and other vessels of Cassidoine; and Pompey himself was the first who that verie day of his Triumph presented unto Jupiter Capitolinus six such cups: and presently from that time forward men also began to have a mind unto them, in cupbours, counting tables, yea, and in vessels for the kitchen, and to serve up meat in; and verely, from day to day the excesse herein hath so farre overgrowne, that one great Cassidoine cup hath been sold for fourscore sesterces, but a faire and large one it was, and would containe well three sextars, (i. e. halfe a wine gallon.) There are not many yeers past, since that a Nobleman who had been Consull of Rome, used

to drinke out of this cup; and notwithstanding that in pledging upon a time a ladie whom hee fancied, he bit out a peece of the brim thereof, (which her sweet lips touched,) yet this injurie done unto it, rather made it more esteemed and valued at a higher price; neither is there at this day a cup of Cassidoine more pretious or dearer than the same. But as touching other excesse of this personage, and namely how much he consumed and devoured in superfluities of this kind, a man may estimate by the multitude of such Cassidoine vessells found in his cabinet after his death, which Nero Domitius tooke away perforce from his children; and in truth, such a number there were of them, that beeing set out to the shew, they were sufficient to furnish and take up a peculiar Theatre, which of purpose he caused to be made beyond the Tyber in the Gardens there; and enough it was for Nero to behold the said Theatre replenished with people at the Plaies which he exhibited there in the honor of his wife the Empresse Poppæa, after one childbed of hers, where among other musicians, hee sung voluntarie upon the stage before the Plaies began. I saw him there my selfe to make show of many broken peeces of one cup which he caused to be gathered together, full charily, as I take it, to exhibite a spectacle whereat the world should lament and crie out in detestation of fortune, and no lesse ywis, than if they had beene the bones and reliques of King Alexander the Great his corps to been laid solemnly in his sepulchre; and herein he pleased himselfe not a little. Titus Petronius, late Consull of Rome, when hee lay at the point of death, called for a fair broadmouthed cup of Cassidoine, which had cost him before time three hundred thousand sesterces, and presently brake it in peeces in hatred and despite of Nero, for fear lest the same Prince might have seazed up it after his decease, and therewith furnished his owne bourd. But Nero himselfe (as it became an Emperour indeed) went beyond all others in this kind of excesse, who bought one drinking cup that stood him in three hundred thousand sesterces; a memorable matter (no doubt) that an Emperour, a Father and Patron of his Country, should drink in a cup so deare. But before I proceed any further, it is to be noted that we have these rich Cassidoin vessels (called in Latin *Murrhinæ*) from out of the Levant; for found they be in many places of the East parts, and those otherwise not greatly renowned, but most within the kingdome of Parthia; howbeit, the principall come from out of Catmaria. The stone whereof these vessels be made, is thought to be a certaine humour thickened and baked as it were within the ground by the naturall heat thereof. In no place shall a man meet with any of these stones larger than small tablements of pillars or counting bourds; and seldome are they so thick as to serue for such a drinking cup as I haue spoken of alreadie. Resplendent they are in some sort, but that brightnesse is not pearcing; and to say a truth it may bee called rather a polished glosse and lustre than a radiant and transparent clearnesse; but that which maketh them so much esteemed is the varietie of colours, for in these stones a man shall perceive certaine veines and spots, which as they be turned about resemble divers colours enclining partly to purple, and partly to a white: hee shall see them also of a third colour composed of them both, resembling the flame of fire: thus they passe from one to another as a man holdeth them; in so much as their purple seemeth to stand upon white and their milkie white to bear as much upon purple.

MYR-
RHINE

MYR-
RHINE.

Some esteemed those Cassidoine or Murrhine stones richest which represent as it were certaine reverberations of sundrie colours meeting alltogether about their edges and extremities; such as wee observe in rain-bowes; others are delighted with certaine fattie spots appearing in them; and no account is made of them which shew either pale or transparent in any part of them, for these be reckoned great faults and blemishes. In like manner, if there be seene in the Cassidoine any spots like cornes or grains of salt; if it containe resemblances of werts, although they bear not up but lie flat as they doe many times in our bodies: finally, the Cassidoine stones are commended in some sort for the smell that they do yeeld." (xxxvii. 2.)

Philemon Holland, as we need not say, is quite as long-winded and rather more dull than usual in this passage, but it has been necessary to extract it, as containing almost the whole substance of our knowledge, or rather of our ignorance, concerning the ancient Myrrhines. In another place Pliny speaks of their material as a fossil production, *Murrhina et crystallina ex eadem terrâ effodimus*: (xxxiii. 2.) and again, that both these substances are best adapted for cold potations, *frigidi potûs utraque*: (xxxiii. 11.) in which assertion he is pointedly contradicted by Martial:

*Si calidum potas, ardenti Murra Falerno,
Convenit, et melior fit sapor inde mero.*

Unless it be possible to understand *calidum* in that passage not in reference to the temperature hot or cold, but to the fiery (*ardens*) quality of the Falernian; on which account, as a heating wine, it will be better drunk from a cup possessing cooling virtues.

Du Cange, *ad v. Mazer*, speaks largely of Myrrhines, to which the "mighty mazer" of modern writers has sometimes been referred; and he collects a few varieties of opinion. Thus Baronius (*ann.* 34.) esteems Myrrhines to have been formed artificially from congealed Myrrh; Julius Scaliger (*de Subtilitate*) and Salmasius (*ad Solinum*) call them porcelain, on the authority of a line of Propertius not easily comprehensible in any other sense,

Murrheaque in Parthis pocula cocta focis. (iv. 26.)

Petrus Bellonius (*Observat.* ii. 7.) says they were made from the shell of the *Murex*; Antonius Nebrissensis names them Agates; Andrea Cæsalius (*de Metallis*, iii. 23.) the dross and scoria of fused metals which smell like Myrrh; and we know not how many other authorities say they are Onyx, or some other fossil. Well might Turnebus remark, after wading through these and perhaps many more discrepancies, *tantam nobilissimorum Scriptorum in re frequentissimâ dissensionem annotatione dignam prorsus existimandam.* *Advers.* viii. 1. If the reader wishes for an entire volume in which the subject ought to be exhausted, he may turn to the very learned Work of J. F. Christius *de Murrinis Veterum*, 1743.

It is not very easy to ascertain the material of which Milton believed them to be formed when he speaks

how they quaff in gold,
Crystal, and Myrrhine cups, emboss'd with gems
And studs of pearl.

Paradise Regained, iv. 118.

Bishop Newton gives two explanations of the above lines, either of which may be admitted without violence: 1st, that Milton rested upon Pliny, *turbâ gemmarum potamus et smaragdis teximus calices, ac temulentia*

causâ tenere Indiam juvat, et aurum jam accessio est; (xxxiii. *ad init.*) secondly, that the construction is, "they quaff in gold emboss'd with gems and studs of pearl." A third might be added, namely, that Milton did not intend to be precise, but that he scattered glowing words with a lavish hand, careless of the direction in which they fell, so as their produce should be a gorgeous and magnificent imagery.

Gifford, who occasionally by one stroke of his pen dissipates all the perplexities of former commentators, and substitutes light for their darkness, hesitates on the *maxima Murrina* of Juvenal. (vi. 156.) After noticing some of the opinions which we have given above, he adds: "I am aware that all this is very unsatisfactory - but I know not where to look for any thing more to the purpose. Salmasius is confused and contradictory on the subject, and Scaliger, who agrees with Propertius, introduces a circumstance which is incompatible with his own explanation. Ainsworth says, *Murra* is a 'stone of divers colours, of which cups are made:' this is well enough, yet he refers to this passage of Juvenal under another word: *Myrrhina*, i. e. says he, 'of myrrh or scented with myrrh.' In some Modern Travels, I find that the districts mentioned by Pliny still afford a gem which answers, in some measure, to his description; it is a species of agate; and this after all, may be the substance in question."

There is yet another use of the word *Murrhinum*, which we will leave Philemon Holland to explain. He does so with more quaintness than he has exhibited in our opening extract, and therefore it is far less tiresome reading: "In old time, the best wines used at feasts were aromatized and spiced with sweet Myrrhe as appeareth in the Comedie of Plautus entituled *Persa*; and yet it should seeme there, that sweet Calamus was to be added besides; and hereupon it commeth, that some have thought, how our forefathers in times past tooke most delight in such spiced cups and Ippocras wines. But Fabius Dorsenus the Poet sufficiently declareth and decideth this point in these verses, when he saith,

Mittebam vinum pulchrum, Murrhinum.

I sent neat wine
Which hight Myrrhine.

And againe in his Comedie *Acharistio*,

Panem et Potentam, vinum Murrhinum.

Both bread and grewell I did present
And Myrrhine wine of pleasant sent.

I see, moreover, that Scaevola, Lælius, and Atteius Capito were of the same mind. For in the Comedie of Plautus entituled *Pseudolus* thus it is written,

*Quod si opus est ut dulce promat
Indidem ecquid habet? CHAR. Rogas?
Murrhinum, passum, defrutum, mella.*

Of dulcet wine if there be need,
What hope is there from thence to speed?

CHAR. Why aske you that? he furnish'd is
With Murrhin, Cuits, and Meade ywis.

By which a man may see evidently, that *Murrhina* was not only counted a wine, but reckoned also among the sweet and delicate wines."

MYRRHIS, in *Botany*, a genus of the class *Pentandria*, order *Digynia*, natural order *Umbelliferae*. Generic character: umbel compound; involucre erect; fruit oblong with deep furrows; angles slightly membranaceous.

One species, *M. odorata*, native of Germany.

MYR-
RHINE.MYR-
RHIS.

MYR-
SINE.

MYSIA.

MYRSINE, in *Botany*, a genus of the class *Pentandria*, order *Monogynia*, natural order *Myrsineæ*. Generic character: corolla five-cleft, conniving; germen filling the corolla; stigma large, woolly; drupe one-seeded, nut five-celled; unripe berry five-seeded; at maturity one-seeded.

Two species, natives of Africa and the Azores.

MYRSIPHYLLUM, in *Botany*, a genus of the class *Hexandria*, order *Tryginia*, natural order *Smilacæ*. Generic character: corolla six-cleft, revolute; styles contiguous, straight; germen on a stalk; berry three-celled; cells two-seeded.

Two species, natives of the South of Africa.

MYRTÆA, in *Zoology*, a genus of *Acephalous Mollusca*.

Generic character. Shell bivalve, ovate, triangular, equivalve, nearly equilateral, closed; hinge of one valve, with a single tooth, and a lateral one on each side; of the other valve, two teeth, the lateral ones obscure.

Type of the genus, *Venus spinifera*, Montagu, *Test. Britt.* p. 577. pl. xvii. fig. 1. Found on the Western shores of England; very rare.

MYRTLE, Fr. *myrte*; It. and Sp. *mirto*; Lat. *myrtus*; Gr. *μύρτος*, from Gr. *μύρον*, a perfumed ointment, from *μύρρα*. See *ante*, MYRRH.

A banke by chaunce by me there stoode, where bright as horne
of hew

With rodde upright and braunches thicke as myrtle bushe there
grew. *Phaer. Æneidos*, book iii.

Nature hath shewed her wonderful power and bountie, especially
in the juice of the myrtle, considering that of all fruits, it alone doth
yeeld two sorts both of oile and wine.

Holland. Plinie, book xv. ch. xxix.

Them she upstaies
Gently with myrtle band, mindless the while,
Her self, though fairest unsupported flour,
From her best prop so farr, and storm so nigh.

Milton. Paradise Lost, book ix. l. 431.

A muse, that long hath wander'd in the groves
Of myrtle-indolence, attempts to sing.

Grainger. The Sugar Cane, book i. l. 6.

MYRTUS, in *Botany*, a genus of the class *Icosandria*, order *Monogynia*, natural order *Myrtaceæ*. Generic character: calyx five-cleft, superior; corolla, petals five, berry two or three celled, many seeded.

There are more than twenty species of this genus known, elegant shrubs or small trees. *M. communis*, the Common Myrtle, of which there are eight varieties, is found wild in Asia, Africa, and the South of Europe. *M. Pimenta*, a native of Jamaica, produces the valuable Pimento or Allspice.

Origin and
name.

MYSIA, a Province in the North-Western part of Asia Minor, anciently comprehending Troas and Æolis, was in after-times divided into two parts, the Olympene, adjoining to Bithynia, and the other on the banks of the Caïcus: (Strabo, xii. vii. l. p. 571.) the former is called the Hellespontic, or *Smaller Mysia*, by Ptolemy, (v. 2.) the latter has therefore been named the *Greater*, though there is not much difference in their extent; and that Geographer probably alluded to Mæsia as the greater of the two Countries called Mysia. This Province was bounded by the Propontis, Bithynia, Phrygia, Lydia, Æolis, Troas, and the Hellespont; but its limits varied at different periods, and could not easily be determined. (Strabo, xii. iv. 4. p. 564.) The Mysi were Thracians who passed over from Europe and drove the original inhabitants of this tract beyond the sources of the Caïcus: as we learn from Xanthus the Lydian, and

VOL. XXV.

Menecrates of Elæa, who said that the Mysians derived their name from a kind of oak, (Ὀξύη, *Quercus cerris*), called Mysus in the Lydian tongue, and abounding on Olympus, as it does indeed throughout Asia Minor. These nations most probably descended from the same stock, and spoke dialects of the same Language, viz. the ancient Thracian or Illyrian: for the Phrygians, called Briges while in Europe, (Herod. vii. 73.) emigrated from Thrace (Strabo, x. 3. 16.) into Asia seventy years before the Trojan war, (B. C. 1254,) according to Conon, (Photii *Bibl. Cod.* clxxxvi.) and were themselves subsequently dispossessed of a part of their territory by the Mysians, (now called Mæsiens, (Μοισοί,*) says Strabo, (vii. 3. 2. p. 295.) who originally occupied each bank of the Danube. They are, in another place, (i. l. p. 6.) expressly called a Thracian people by Strabo, and as such, their Language must have been originally the same as that of the Lydians, who appear to have migrated into Asia from Thrace at a much earlier period; it is not surprising, therefore, if these two nations were unintelligible to each other at the time of the latter migration, and that Strabo (xii. 7. 3.) should speak of the Mysian dialect as half Lydian and half Phrygian.

i. Mysia Minor, or Mysia the Less, extended along the coast of the Hellespont and Propontis, from Lampsacus to the mouth of the Rhyndacus, and was bounded inland by the mountains which give rise to that river, the Mæstus, and the Caïcus. Its principal towns were Cyzicus, Parium, and Lampsacus, on the coast; Apollonia, Miletropolis, Scepsis, and Hierapolis, in the interior. Cyzicus or Cyzicum, anciently called Arctonnesos, (Ἀρκτων νῆσος, Bear Island,) was on the Eastern side of a small island connected with the continent by two bridges. "It is the finest island in the Propontis," says Strabo, (xii. 7. 11. p. 575.) "and measures about 500 stadia (60 miles) in circumference; has a town bearing the same name, near the bridges, two harbours (κλειστοὶς) closed in, and more than 200 docks. (νεωσοί-κους.) The town is partly on a plain and partly on a hill, and is called Arcton oros. (Bear's Hill.) On another hill, called Dindymus, which overhangs it, and has only one summit, there is a Sanctuary dedicated to the Dindymenian Mother of the Gods (Cybele or Rhea) by the Argonauts. This city rivals the first in Asia in magnitude, beauty, and the excellence of its Government both in peace and war. . . . It has three architects who have the care of the public buildings and (military) engines: it has also three magazines, (θησαυροὺς,) one for arms, another for engines, and a third for corn. It sustained a severe siege in the Mithridatic war, having been invested by the King with 150,000 infantry and a large body of cavalry, but was at length relieved by Lucullus." (B. C. 73.) The Island of Cyzicus was united with the continent by Alexander, (Plin. *Nat. Hist.* v. 40.) and the town was a Milesian colony, but derived its name from Cizycus, a Pelasgic Prince, who governed the Country at the time of the Argonautic expedition. (B. C. 1350.) He was killed in a skirmish with those navigators, and an Aristocracy continued to rule over the peninsula till it was invaded a second time by Pelasgi from Lemnos, whence they had been driven by Miltiades. (B. C. 515.) In that or the preceding century,

* According to Tyrwhitt's conjecture for Μυσοί, found in all the MSS. After it became usual to give exactly the same sound to α, υ, ι, υ, and η, they were continually exchanged for each other by ignorant scribes: portentous blunders of this kind are to be seen on almost every gravestone in a modern Greek churchyard.

- MYSIA.** a colony was established in their Country by the enterprising people of Miletus, who extended their settlements along the shores of the Hellespont and Propontis: but Cyzicus did not rise to the summit of its prosperity till the time of the Romans, and it lost its freedom under Tiberius, on account of some violence done within its walls to Roman citizens. (Sueton. *Tiber.* 37.) Its Temple, according to Xiphilinus, was adorned with columns 75 feet high and 24 feet thick. Near its Eastern harbour, now called Panormos, is a place of that name, on the main land, called by the Turks Bándermah. The place has now, says Meletius, (*Geogr.* iii. p. 130.) lost all its former splendour, but is still a Metropolitan See. The Turks call the island Kapú dágh; (Gate or Court Hill;) and the village of Artáki, on its South-Western side, opposite to the Island of St. Simeon, is evidently the well-wooded hill called Artace, with the island opposite to it, bearing the same name, mentioned by Strabo. The neighbouring promontory, called Melanos, (black,) which was passed by persons sailing from Cyzicus to Priapus, is still called Kará búrnú, the Black Nose. About thirty-five miles East of the isthmus which now unites the Island of Cyzicus with the continent, is the mouth of the Rhyndacus, now called Mikhálj or Mikhalitza, which, in the lower part of its course, separated Mysia from Bithynia. It rises in the district of Phrygia Epictetos, called Azanitis, (Strabo, xii. 7. 11. p. 596.) passes through the Lake Apolloniatis, receives several streams in its course from the district called Abrettene and the Macestus, which comes from Ancyra in the district named Abasitis, and enters the Propontis near the Island of Besbicus. (Calólimnos.) About twelve Geographical miles West of the isthmus is the mouth of the Æsepus, (Chatál Dereh,) in Homer's time the boundary of Dardania, the Kingdom of Priam. (*Il.* ii. 825. Strabo, xii. 4. 6. p. 565.) It, as well as the Scamander and Granicus, rises, according to Demetrius a native of that Country, quoted by Strabo, (xiii. 1. 43. p. 602.) from a hill (λόφος) on Mount Ida, called Cotylus, (the Goblet,) more than 120 stadia (15 miles) above Scepsis. It springs from many sources, all within eight stadia of each other, and flows in a North-Easterly direction to the Propontis, after a course of almost 500 stadia. (62 miles.) It was, according to the same authority, thirty stadia (not quite four miles) distant from Palæ-Scepsis. Beyond the Æsepus, at the distance of about eight miles, is the mouth of the Granicus, now called Ust-vólá, (Ust-óválú? i.e. River of the Upper Plain,) which rushes down from the heights of Ida through the plain of Adrastea not far from Priapus, a town celebrated for its devotion to the God of Lampsacus, and placed on a small bay just behind Cape Melanos, now Kará Búrnú. The celebrated defeat of the Persian army by Alexander at the ford over the Granicus, (Plut. *Alexandri Vitá,*) and the victory of Lucullus over the forces of Mithridates, nearly in the same spot, (Plut. *Luculli Vitá,* p. 498.) have given a peculiar celebrity to the name of this river; but its position, though clearly determined by Strabo, was mistaken by Ptolemy, (v. 2.) who places its mouth to the West of Parium. It is not surprising, therefore, that other rivers have been taken for it by Tournefort and other travellers. On the Granicus was Sidene, (Strabo, xiii. 1. 12. p. 587.) which gave its name to a considerable territory, but had been destroyed before Strabo's time. A few miles to the West of Priapus, at the mouth of the Hellespont, was Parium, (Strabo, xiii. 1. 13. p. 588.) the ruins of which are still seen near a village, called from them Camáres. (*i. e.* Arches.) It had a larger port than Priapus, and its population was much increased by emigrations from that place. Its buildings also were embellished or constructed at the expense of the shrines of the Actæan Apollo and Diana in the ancient city of Adrastæa, the Oracle of which, as well as that of Zelea, had become silent before the establishment of the Attalic dynasty. Under the Romans, Parium and Troas were the only towns in Asia Minor which enjoyed the privilege of Italic rights. (*Italici juris*, Paullus, *Lege viii. de Censibus*.) The Parian coins are well known to antiquaries. Opposite to Gallipoli (Καλλιπόλις, Strabo, *ib.* p. 589.) is Lampsacus, near the sea, remarkable for the excellence of its harbour, its wine, and its devotion to Priapus. Pityæa near Parium, Colonæ, a Milesian colony not far from Lampsacus, and Gergithium in the same neighbourhood, are mentioned by Strabo. (*Ibid.*) Germa, or Hiera Germa, (now called Germasti,) was at the confluence of the Macestus and the Tarsius, to the South-East of Cyzicus: not many miles below the Lake Miletopolitis, through which that river passes, and on the shore of the lake, the town of Miletopolis stood. It was a flourishing place, and had the privilege of striking its own coin under the Roman Emperors. There were no other towns of note in the Olympene or Hellespontine division of Mysia; and most of those celebrated by Homer had ceased to exist before the time of Strabo, who, in his XIIth and XIIIth Books, has ably illustrated the Homeric Geography of this part of Asia Minor.
- ii. Mysia Major, as it is commonly, though erroneously, called by most modern Geographers, comprehended the plains South of the Æsepus, and the valley of the Caïcus and its affluents; being for the most part shut out from the Ægean Sea by Æolis, which it enclosed on three sides, and was anciently a part of its territory. Adramyttium,* on a small stream flowing into the gulf which bears its name, was an Athenian colony, and possessed a good harbour. It was in the rich plain of Thebe, and is said by Pliny (*Nat. Hist.* v. 32.) to have been anciently called Pedasus. In the mountains to the South of the plain there were mines of copper. (χαλκοῦ, Strabo, xiii. 1. 52. p. 607.) About twenty miles North-East of Adramyttium is Scepsis, sixty stadia (about seven miles) lower down than Palæ-Scepsis, (Old Scepsis,) which was just below the highest peak of Ida. The inhabitants migrated from the upper to the lower town under the guidance of Scamandrius, son of Hector, and Ascanius, son of Æneas, in the XIIth century† before the Christian Era. Their descendants reigned there for many years, and still retained the title of King, with some honours, after the form of Government had been changed, first to an Aristocracy, and subsequently to a Democracy, in alliance with the Milesians. The inhabitants of Scepsis were removed to Alexandria by Antigonus, (about B. C. 300,) but restored again to their own Country by Lysimachus. The town flourished

* Various spelt by ancient writers, or rather by their transcribers, Atrammyttéum, Adramyttéus, Atramyttéum, Atramyttium.

† Or in the XIIIth, according to Larcher's System, which is strongly supported by synchronisms derived from independent sources, and accords best with the data afforded by the oldest Historians.

MYSIA. under the Kings of Pergamum; and Neleus, a native of it, who was a Socratic Philosopher, and had been a disciple of Theophrastus and Aristotle, having inherited the school and library of the former, to whom Aristotle had left all his writings, removed them to Scepsis. After his death, the books were buried by his heirs to prevent their being seized for the Royal Library at Pergamum. They were sold a good while afterwards for a large sum to Apellicon of Teios, notwithstanding the injury they had sustained from damp and worms, and when transcribed the defective passages were very ill filled up; hence the obscurity and imperfections in the Works of Aristotle and Theophrastus. After the death of Apellicon, his library was seized by Sylla, on the capture of Athens, and conveyed to Rome, where the Works of Aristotle were transcribed for sale by ignorant scribes still more incorrectly. (Strabo, xiii. l. 54. p. 608.) The position of Scepsis can only be conjectured, as it lies entirely out of the direct roads across Asia Minor, and has never been visited by any modern traveller. Teuthrania, a large division of Mysia, named from Teuthras, King of the Cilices and Mysi, was within the Caicus, and comprehended the valleys of that river and its tributaries. It was considered as a part of the Troad by Pliny; (v. 33.) and from the mountains on its confines the Caicus sprang. That river is therefore styled by the Poets Mysian (Mysus, Virg. *Æn.* iv. 370.) and Teuthrantéan. (*Teuthranteusque Caicus*, Ovid, *Mét.* ii. 243.) On the same stream was a town bearing the name of Teuthrania, not more than seventy stadia (eight or nine miles) from the coast and from Pergamum, near which the Caicus ran. (Strabo, xiii. p. 624.) That stream rises from several springs in a plain separated by Mount Temnus from the plain of Apia, (or Appia,) which lies in the interior of the country above the plain of Thebe: and from Temnus rises the river Mysius, which runs into the Caicus, not far below its sources. Near to them was a town called Gergitha, (*Γέργιθα*,* Strabo, xiii. p. 616.) to which Attalus removed the inhabitants of a place in the Troad bearing the same name. The Caicus flowed into the Elaïtic Gulf, twelve stadia (one mile and a half) from Elæa, and thirty stadia (nearly eight miles) from Pitane.† Those towns belonged to Æolis. (xiii. p. 614.) The latter had two ports, and was at the mouth of the river Euenus, from which there was an aqueduct supplying Adramyttium with water, and the former was the naval arsenal and port (*ἐπιπύριον*) of Pergamum, 120 stadia (15 miles) distant. "That city," says Pliny, (*Nat. Hist.* v. 33.) "is far the most illustrious in all Asia:" it still retains its ancient name‡ (Berghamah) somewhat altered, and many relics of its former splendour. It was the Capital of the Attalic Kings, (Strabo, xiii. p. 623.) situated in the plains of the Caicus, per-

haps the most productive in Mysia; and besides a celebrated Temple of Æsculapius, (Tacit. *Annal.* iii. 63.) it possessed the finest Library, next to that of Alexandria, known in the ancient world. It was collected by Eumenes, son of Attalus, and contained 200,000 volumes. (Plutarch, *Vitâ Antonii*, p. 943.) The mode of preparing skins for writing (called parchment, from the adjective *Pergaminum*) was first discovered at Pergamum, says Varro, (Plin. *Nat. Hist.* xiii. 21.) when Ptolemy, jealous of the success of Eumenes in augmenting his library, prohibited the exportation of paper. (*Chartas*.) Pergamum was traversed by the river Selinus, and the Cetius passed close to it, both descending to the Caicus. Mysia, like the rest of Asia Minor, is a mountainous Country, consisting of valleys lying between the different chains of hills, forming terraces in the ascent to the highest ridges; or of basins through which the rivers descend to the sea. It therefore formed many natural subdivisions, each having its own peculiar name, some of which are mentioned by ancient writers: as Abrettene, the district through which the Mæcæstus flowed; Morene, an adjoining plain; Dolionis, a tract on the coast near the mouth of the Rhyndacus. The extent and position of these subdivisions would probably appear on an accurate survey of the Country. The whole coast as far as the mouth of the Hermus, is considered by Ptolemy as a part of Æolis, and the towns near the sea were for the most part Æolian colonies. Other and older writers extend the boundaries of Æolis to the promontory called Lectum (now Capa Bábá) Northwards, and therefore took in a part of the Troad. At the distance of about 100 stadia North-West of Elæa, at the mouth of the Caicus, was Cana, a cape opposite to Lesbos, forming the other extremity of the Gulf of Adramyttium. (Edremid.) In the neighbouring district, called Canæa, there was a Locrian colony, named from the Cape, Canæ. (Strabo, xiii. l. 63. p. 615.) Next to Elæa was Grynium, or Grynea, anciently an island, afterwards joined to the continent, and having two ports belonging to the Myrinæans. The Oracle of the Grynæan Apollo was much consulted in the Heroic Ages, (Virg. *Æn.* iv. 345.) and a Temple of the God, of splendid white marble, was still existing in the time of Strabo. The Elaïtic Gulf extended from Hydra, a promontory forty stadia (five miles) beyond Cyme to Cape Harmatus, and measured about eighty stadia (ten miles) at its mouth. The port of Myrina, afterwards called Sebastopolis, was sixty stadia (or seven miles and a half) from Hydra; forty stadia (five miles) further to the North was Grynium, named above; and seventy stadia (eight miles and a half) from it, Elæa, built by Menestheus and the Athenians who accompanied him to Ilium. "Cyme," says Strabo, (xiii. 3. 6. p. 622.) "is the largest and best, and, together with Lesbos, almost the metropolis of the other Æolic cities, about thirty in number, not a few of which have been destroyed." It was founded by Pelops, (about B. C. 1360,) and was one of the towns which suffered in the dreadful earthquake in the third year of Tiberius. (A. D. 17.) Its inhabitants, the Cymæans, enjoyed the privileges of Roman citizens. (Liv. xxxviii. 39.) Cyme, in the Pentingerian Table, is said to be only nine miles from Myrina, the distance being measured probably over land, not along shore, as in the above citation from Strabo. Between Myrina and Cyme, Cyriac of Ancona, in the XVth century, saw the remains of a Temple dedicated

* Not Gergetha, (*Γέργεθα*), as appears from Pliny (*Nat. Hist.* v. 32.) and the authorities quoted by Hardouin, as well as from the various readings in the MSS. of Strabo. (xiii. l. 19. tom. v. p. 290. ed. Siebenkees.)

† In the Map of Asia Minor published by "The Society for the Diffusion of Useful Knowledge," Elæa is made eight miles and Pitane about three miles from the mouth of the Caicus, directly in the teeth of Strabo. The Lake of Bighâ, supposed by D'Anville to be the Aphnitis, anciently called Artynia, (Steph. Byzant.) is entirely omitted, and the course of some of the rivers is at variance with Col. Kinneir's Itineraries.

‡ The name is written differently by ancient writers: Pergamum, (*τὸ Πέργαμον*), Strabo, Pliny; Pergamus, (*ἡ Πέργαμος*), Stephanus Byz. and Polybius.

MYSIA. to "the Oracular Apollo" by Philetærus, son of Attalus.

MYSORE. For authorities, see GREECE, LYCIA, and *Histoire d'Hérodote*, par Larcher, Paris, 1802, 9 tomes, 8vo.; *Homeri Ilias*; *Virgillii Æneis*; *Ovidii Metamorphoseôn*, libri xv.; *Plutarchi Opera*; *Taciti Annales*.

MYSIS, in *Zoology*, a genus of *Macrourous Crustacea*.

Generic character. *Antennæ* four, setaceous, the lateral ones longest, with a large ciliated scale at the

base, the intermediate bifid; exterior *pedipalpi* with the middle joint of the peduncle longer; legs bifid, the fourth pair with the interior lacinia ovate, compressed; body long, cylindrical; shell smooth; *abdomen* composed of six segments, terminated by a fin of five leaflets; eyes large, globular, placed on short stout peduncles. Females with valves at the breast to retain their ova.

Type of the genus, *M. spirulosa*, Leach. Several species, of which the type, and at least one other species, inhabit the British coasts.

Soil and rock.

MYSORE, (Mahísór, or Mahésór, from Mahéswara, i. e. the great Lord, a well-known title of Siva or Mahishásura, the Asura Mahisha,*) a large Principality in the Southern part of the Indian Peninsula, comprehended between 11° and 15° North latitude, and 75° and 79° East longitude. Its boundaries have varied at different periods according to the power and vigilance of its rulers, and during the usurpation of Hhaïder 'Alí and Tipú, it was extended beyond its original limits. After the restoration of the Hindú dynasty in 1799, its confines were distinctly settled, and since that period it has been bounded by the territory of the Nizám on the North and North-East; the districts annexed to the Bárah Mahall (Twelve Districts) on the East; North Coïmbetór on the East and South; Winád and Kúruga on the South and East, and Kannara on the West. Its greatest length measures 190 Geographical miles, and its greatest breadth about 170 Geographical miles; but as its form is nearly triangular, its area is not represented by the product of those numbers. It is, as the course of its rivers plainly shows, the highest level to the East of the G'háts, (Sahyádrí,) forming, as the mountains rise to the East as well as to the West and South, the table land of the peninsula. Siva-ganga, North-West of Bangalór, its highest mountain, is 4600 feet above the sea; Bangalór, 2807 feet; Bédamangalam, above the borders of the Bárah Mahall, 2435 feet; Pedda-náyaka durga, at the pass through the Eastern G'háts, 1920 feet; Mahísór hill is 3446 feet, and the heights near Sirá only 2223. Tádiyanda mól, near the source of the Káverí, one of the highest peaks in the Sahyádrí chain, measures 5681 feet, and Sub'hramaní, from which the Kumára d'hari (the Southern branch of the river passing by Mangalór) flows, is 5583 feet above the level of the sea. Its great elevation renders this tract of country peculiarly healthy, and the rain instead of falling in torrents for a length of time at particular seasons, comes in showers, sometimes very heavy ones, throughout the year. The basis of the soil is almost every where a kind of sienite, consisting of an aggregation of quartz, feldspar, hornblende, and mica. Vast naked masses of this rock continually project above the alluvial and secondary strata, and form the hill-forts (durgas or drugs) with which this territory abounds. Natron (carbonate of soda) and common salt (muriate of soda) are found in an efflorescent state on the red soil, in the dry

season. Though the parent of some large rivers, this tract is traversed by no considerable stream except the Káverí, which rises on its South-West boundary, and completely crosses its Southern division. In the Northern districts there are many large reservoirs, which are filled during the rains, and afford a better beverage than the wells, the water of which is often brackish.

The Principality of Mysore is now subdivided into the three Provinces (Súbáyanas or Ráyadas) of Pattana, Nagara, and Ch'hatra-kal, from the towns where the chief offices (kach'hari) are held. The largest is Pattana, or more fully Srí-Ranga-pattana; (Seringapatam;) the next is Nagara, an abbreviation of Hhaïder Nagar or Biderúru; (Bednore;) the third, and least in magnitude, is Ch'hatra-kal or Ch'hatra-durg. (Chitel drug,) also called Sitala durga. In 1801, their subdivisions and population were as follows:

	Ta'alluks.	Houses.	Families.	Population
Pattana Ráyada.	91	390,152	331,129	
Nagara.	19	73,948	72,873	
Chhatrakal.	13	31,320	29,289	
Total	123	495,420	433,291	

This Table, which was then considered by Dr. Buchanan as merely an approximation to the truth, (*Travels*, iii. 413.) has no doubt long since ceased to be even that; as thirty years of uninterrupted tranquillity and good government must have greatly increased the numbers and improved the condition of the natives of Mysore.

As is usual in Tropical Countries, the country is quickly overspread with wood and thickets, whenever its cultivation is neglected; and perhaps, even now, there are in this territory extensive tracts covered with the wild date. (*Elate sylvestris*.) Various kinds of pulse, sesamum, and sugar-cane are commonly cultivated; but the most important crops are rice and rággi, (the Canarese name of the *Cynosurus corocanus*;) the latter being the common food of the lower ranks. Ricinus palma Christi for castor-oil, poppies for opium, and their seeds for a seasoning in cakes, the piper betle for its leaves, aloës for hedges, and the cocoa-nut for food, beverage, and covering, are universally cultivated. As the latter flourishes in the central parts of Mysore, it is manifest that it does not require a maritime atmosphere, but a soil impregnated with salt is probably indispensable; and the saline particles with which the vegetable mould here abounds, will account for the thriving of this tree so far inland. The cattle are of the same kind as in other parts of India, except the goats, which are of the tall, long-legged breed. The butter commonly in use, is

* In inscriptions, however, it is written Mahásura, said to signify Great Warrior. (Buchanan, *Trav.* iii. 426.) Sir William Jones considered Mahísór and Mahásúr, as corruptions of Mahéswara, i. e. Siva. (*As. Res.* iii. 42.)

MYSORE. g'hí (liquid butter.) It is generally kept two or three days before it is boiled and potted, and, if rancid, it is so much the more relished by the natives. The population, in 1801, has been already mentioned. In 1804, the number of families was estimated at 482,612, and the whole of the inhabitants at 2,171,754 persons, or about four and a half to a house, while three years before there were more houses than inhabitants.

Local customs. The Mohammedans did not penetrate so far South, till a very late period; the Hindú habits and customs have therefore been preserved in this Country in greater purity than in most places further North. Each village has a public washer, who washes the clothes of all the cultivators, and receives a share of the crop as his recompense. The village astrologer is another hereditary officer who has a claim upon the public stock, for the land belongs rather to the community than to individuals, and the produce is shared out in fixed portions to the different claimants. The cottages, though built of mud, are neater and more convenient than is commonly the case in India, and differ only in size, and a coat of white-wash, from the dwellings of the rich. No part of India has fewer handsome buildings to boast of, for the Hindús seldom display any architectural magnificence except in the Temples of their Gods, and such monuments were, for the most part, destroyed by Típu and his fanatical agents; his own grandes, moreover, were too well aware of the uncertain tenure by which they held their possessions, to expend any money except for present and immediate enjoyment. There are few Mohammedan Countries where the government does not levy exactions as soon as ever any display of wealth is made; hence an external appearance of indigence is affected by the great and wealthy almost throughout Asia. Polygamy produces the same mischievous consequences here as elsewhere, and the women, though not absolutely imprisoned, seldom appear in public. Disparity of age is no impediment to marriage, and old men are often united to girls, so that, if the husband is of a high caste, these unhappy brides are condemned to a perpetual widowhood. The marriage of first cousins is considered, throughout India, as incestuous. Pork is eaten by the middle classes, but few will touch fish. Among other peculiarities is their horror of a dead ass; if one be killed in the street of a village, it is forthwith deserted; and the slaughter of a donkey is sometimes the stratagem by which an aggrieved man dislodges the aggressor. The majority of the Hindús are allowed to eat animal food and drink spirits; but abstinence and self-denial are here, as throughout Asia, cardinal virtues; and no Religion is more productive of ascetics than that of the Bráhmans; hypocrisy, therefore, and cant are nowhere more common than among them. The Royal family is divided into two branches, the Rája-bandas and Kallaláís, which intermarry the males of the one with the females of the other, and *vice versa*. The head of the former is styled Kurtur, and is the Rája or Prince; the head of the latter is called Dalawaí or Minister, and the Princes are always considered as Vaishnavas or votaries of Vishnu. The women wear the linga, (or phallus,) and are therefore Saívas, and under the guidance of Jamgamas, *i. e.* Sanyásís of that sect. These Princes trace their origin to the Yádava or descendants of Yadu, supposed to have flourished 2500 years before the commencement of our era, (*Encycl. Metr.* xxiii. 675.) through Kríshna, who lived at Dwáraká in Gurjaráshtra (Gujjerát) in the XIIIth century before Christ: but the list

of their predecessors does not extend beyond Chám Rája, who began to reign A. D. 1507.

MYSORE. i. The most remarkable towns in the Pattana Ráyada (City District) are: 1. Mahásura nagara (the City of Mahásur,) otherwise called Srí-Ranga-patana, (the City of the Great Siva,) in 12° 25' North and 76° 41' East, is situated at the West end of an island formed by two branches of the Káveri, here a wide and rapid stream. This island, which is highest in its Southern and central part, is about four miles long, and one and a half broad, in its widest part; its elevation above the sea is 2412 feet. Of the city, which occupies so large a part of it, the walls, strongly but injudiciously fortified by Típu in the Indian style, are now falling into ruin. On the high ground in the centre of the island is the Shehr-ganjam, a well-built and crowded suburb, with wide streets at right angles, shaded by rows of trees. In an adjoining garden is the Mausoleum of Hhaider Alí, containing the remains of himself, his wife, and son, Típu. The Palace, a vast and irregular pile of buildings, is now almost a ruin, having been left untenanted since the garrison, to whose use it was given up, has been reduced to a single battalion. A good road under the ramparts and a handsome bázár are the only advantages which this Capital possesses. Its streets are narrow and dirty with no public buildings of any magnitude, except the Great Mosque, the Temple of Srí Ranga, (Siva,) and a manufactory of gun-carriages in the former palace of the Rájás; it is neither agreeable nor attractive. The Deryá 'adálet-bágh, (Imperial Garden,) Típu's favourite residence, has been converted into an abode for the English Resident, and is worth seeing on account of its paintings and decorations; but the bridge erected by Purniá is perhaps the most curious object in the place. Three rows of cubic masses of granite, sixty-seven in each row, mortised into the rock below, and connected by cubes of the same material above, support slabs of similar stone thrown across, and thus form a road over the Northern branch of the Káveri; a similar and older bridge over the Southern branch of the river, also serves as an aqueduct to supply the town with water. This place was the residence of a petty Rája who possessed two Ashta-gráms or districts, containing eight villages, and was taken, about A. D. 1524, by the Rája of Mahásur, (Mahísór,) who already possessed thirty-two villages. (Buchanan, ii. 172.) It was probably retaken soon afterwards; for it was a part of the Sultán of Bájánagar's territory, and was finally obtained from his Viceroy by Ráj Wadiyár, in A. D. 1610, who was the fourth of the Mahesór dynasty, and his eighth successor, Chik Kríshna Rája, became the prisoner of one of his Musulmán commanders, Hhaider 'Alí Khán, in 1760. He died in 1766, but his adopted son, raised to the throne by Hhaider, lived till near the close of the last century, after having experienced the harshest treatment from Típu and his officers. Kríshn Udyáver, the infant son of the last Kurtur or Rája, was found by the English commander in a state of great destitution, at the capture of Seringapatam in 1799. He was immediately seated on the throne of his ancestors under the guardianship of Purniá, a Bráhman, who had been Minister of Finance to Típu, and in 1812, when nineteen years of age, the government of his territories was entirely given up to him. His conduct has ever since been liberal and praiseworthy, and he has afforded an example of equity and self-control rarely to be found among Asiatic Princes. In 1800, the population of Srí-Ranga-pattanam was esti-

MYSORE. mated at upwards of 20,000; in 1820, it is said to have been less than 10,000; but the diminution may be accounted for by the removal of the Court, and the exaggeration which is manifest in the former account. By the Treaty which restored the Rájá to the throne, the Island of Pattana was ceded to Great Britain, and the Court was consequently transferred to its former residence, Mahásur, (Mahísór,) nine miles further South.

City of
Mysore.

2. That ancient Capital of the Kurtur, in $12^{\circ} 16'$ North and $76^{\circ} 41'$ East, is situated in a Ta'alluk or district South of the Káverí, called Mahásura ashá grám, from its containing eight villages given to Brahmans as an in'ám or religious endowment. Típú, with his usual policy of extirpating every trace of Hindú sovereignty, razed this city to the ground, and used the materials of the Palace and Temples in building a fort called Nazarbár, (Bel-vedere,) on a neighbouring eminence. (Buchan. i. 67. 82.) On the restoration of the Kurtur in 1799, nothing but a wretched hut, erected by Típú for the use of his labourers, could be found on the site of the Capital for the installation of the young Prince; but the rebuilding of the Palace was immediately begun, and a new town arose speedily around it. In 1820 it already covered a large space, and presented a scene of rare occurrence in Asiatic cities, regular streets shaded by trees and adorned with Temples. It is enclosed by a wall of red earth much in the style of the fortifications of Seringapatam, but its houses are larger and better built. The pettah or town is separated from the fort by an esplanade; and the latter (meant to be in the European style) contains, besides the Rájá's palace, houses inhabited by the richer inhabitants. There is also a suburb to the South of the fort. Between the latter and the hill of Mahásura, there is a vast tank which supplies the place with water; and on the summit of that eminence, which is 3446 feet above the sea, is the house of the British Resident. Near the foot of the hill are some celebrated Hindú Temples, and further down a gigantic figure of the Bull Nandi (here called Baswa) sixteen feet high, and executed in a better style than that at Nandi-durg. The Mahásura district had, in 1801, 4527 houses, and therefore its population might be rated at 22,135 souls.

Sera or
Serah.

3. Sirá, in $13^{\circ} 44'$ North and $76^{\circ} 56'$ East, is one of the oldest Mohammedan conquests in the Principality of Mysore. Its highest point is only 2223 feet above the sea. Its soil is impregnated with salt, and its climate is too dry for rice. In 1801, it had 6593 houses, but was then much reduced by the various invasions to which it had been exposed. In A. D. 1644, it was conquered by the Sultán of Bájá-púr, (Visiapore,) and, on the fall of that dynasty, became the Capital of an independent sovereignty, which was very flourishing when subverted in 1784 by Hhaider 'Alí, on whom the Súbah or Province of Sirá had been conferred by the Nizám of the Dekan, who claimed the sovereignty of it, as representative of the Sultán of Bájá-púr. (Grant, Duff, ii. 77.) It is said to have then contained 50,000 dwellings. The town, in 1801, consisted of one street with a tolerably handsome Mosque, the Jámi' masjid, and a citadel, one of the most regular fortresses in India. A fine reservoir to the North of the fort, furnishes a supply of water for the irrigation of the surrounding country.

Nundy
Droog.

4. Nandi Durga, 31 miles North by East from Bangalór, and in $13^{\circ} 22' 12''$ North and $77^{\circ} 22' 29''$ East, is one of the many strong hill-forts in Mysore. It rises as an oblong hill 1700 feet above the level of the plain, and is on three sides inaccessible. Its ascent, about a mile and a

half long, is for the most part a sort of staircase cut out of the rock. On the summit is the fort, containing barracks and a Hindú Temple; the garrison is now stationed in the pettah or town below. About a mile to the West, in a narrow defile, is the celebrated figure of the sacred Bull Nandi, in a recumbent posture, and about nine feet high. The God is worshipped in the human form under the name of Nandíswara (the Lord Nandi) in the adjoining Temple. The capture of this fort cost Hhaider a blockade of three years, but it was taken by storm in 1791 by the British forces, after a siege of only three weeks. From the neighbouring hills spring both the Northern and Southern Pennár, (Pinákaní,) one flowing to the North and the other to the South, as well as the Pálár, (Pál-áru,) which runs to the South-East; the land is here therefore the highest in this part of the Peninsula. The elevation of the Western G'hébr proves, however, as had been long ago conjectured, to be more considerable. Nandi-durg itself is nearly 4857 feet above the level of the sea, and is much the highest point on this side; but Bal-ráyan durg, near the sources of the Tunga and B'hadra, which united form the Tungab'hadra, (or Tumb'hadra,) is 4999 feet, and therefore considerably higher than Nandi, while Sub'hramaní, near the Northern sources of the Káverí, measures 5583 feet and a half, and Taddyánda mól, near its Southern sources, rises to the height of 5682 feet above that level. (As. Res. x. 583, 584.)

5. Kólár, in $13^{\circ} 8' 20''$ North and $78^{\circ} 9' 41''$ East, is Colar. the Capital of a district on the Eastern confines of the Kurtur's dominions. It contained, in 1801, 10,209 houses, but little more than 7000 families; its commerce having been ruined by Típú, who prohibited all intercourse to the Eastwards. It has a strong mud fort and a Mosque, College, and Monument, erected by Típú in honour of Hhaider 'Alí, of whom it was the birth-place. On a hill near it, are the remains of a fort occupied by Kásim Khán, one of Auréngzéb's Generals, who first pushed the Musulmán conquests so far South. Efflorescent salt is collected in the low lands, and at Markúpam, nine miles East of Búdi-kóta, gold dust is found; the whole area yielding it measures 130 square miles.

6. Bangalúru, called Bangalór by the Musulmán, is Bangalore. a large town, founded by Hhaider 'Alí, in $12^{\circ} 57' 34''$ North and $77^{\circ} 35' 45''$ East, 70 miles North-East of Seringapatam, and 215 miles West by South of Madras. Its level is upwards of 3000 feet above the sea, so that its climate is far more temperate than on the coast, and allows of the cultivation of many European fruits and vegetables, which cannot be raised without difficulty in other parts of the Peninsula. There is a gradual descent both to the North and West, and Seringapatam lies much lower than this place. The fort is regularly built, and of great extent, but ill planned. It contains Típú's Palace, which is sometimes used by the Kurtur. A strongly fortified pettah or town is close to it, containing a spacious bázár shaded by cocoa-nut trees; and two miles off is the British cantonment, which, with its European shops, assembly-room, reading-room, and race-course, revives the recollection of comforts and amusements intimately associated with the remembrance of home. Spinning and weaving are the most ordinary occupations of the inhabitants, who manufacture cloths of wool, silk, and cotton, well calculated for the use of their countrymen. The trade of this place was almost ruined by Típú; and in 1806, its 17,506 houses contained only 11,532 families; (Buchan. iii. 416.) but it has recovered rapidly since

MYSORE. the restoration of the Hindú dynasty, and its population, in 1805 was estimated at 60,000 souls.

Muggery,
or Mugga-
dee.

7. Magadi, twenty-two miles nearly due West of Bangalore, is a fort of some strength, surrounded by fine old trees, and groups of Pagodas, in a tract irrigated from a spacious reservoir. This is altogether one of the most picturesque spots in the whole Province. Its soil abounds in iron ore, and its forests in sandal-wood. (*Santalum album*.) The lowest part of the stem is the most valuable, but above two-thirds of it are devoid of smell; a rocky soil also produces the best wood. (Buchan. i. 186.)

Severn, or
Saven
droog.

8. Sávana durga, three or four miles from Magadi, is a strong hill-fort, in $12^{\circ} 55' 10''$ North and $77^{\circ} 18' 50''$ East, placed on a rocky base of nine or ten miles in circumference, and surrounded by a forest purposely rendered impenetrable by clumps of bamboos. The rock itself rises nearly perpendicularly 4004 feet above the level of the sea. The upper part is divided by a chasm into two hills, each crowned by a fort which can be defended independently of the works below. It is a memorable and almost incredible event in the History of Indian warfare, that this fort, apparently impregnable, was taken by storm in 1791, without the loss of a single man, and only one of the assailants wounded. The Bráhmans officiating in the Temples, and a small guard of the Kurtur's troops, are now the only inhabitants of this celebrated fort, the atmosphere of which is proverbially pestilential, in consequence of the surrounding forests.

Ramgeery,
or Ram-
gherry.

9. Rámagiri, (Mount Ráma,) in $13^{\circ} 56' 53''$ North and $76^{\circ} 8' 11''$ East, is a small town which, in 1801, contained 1798 houses and 1757 families. On a tree called jála, (a species of Shorea, or rather Vatica,) which grows on the neighbouring hills, (Buchan. i. 170.) gum lac is produced, but the inhabitants are chiefly herdsmen. A wild race called Kat' Eriligarú, or Kat' Chensu, inhabits these forests. They are often found in a state of perfect nakedness, and live under bushes or in caverns like the Boschjesmanns near the Cape of Good Hope. They maintain themselves by the chase and the sale of gums, which they gather in the woods; and the more civilized inhabitants believe them to have the power of fascinating tigers. Their Language, which is a dialect of the Tâmil, confirms their own traditions that they came originally from the Animalaya forests below the G'háts. They are probably a relic of the aboriginal Tribes driven from the low lands by Hindú invaders, for they appear to have little or no acquaintance with the Religion of the Bráhmans.

Kat-tchain-
soo.

Mayl cotta.

10. Máil Kótai, an open town on a high rocky hill near the Káveri, in $12^{\circ} 39' 57''$ North and $76^{\circ} 40' 21''$ East, is well built and paved, and has a remarkable Pagoda dedicated to the Nara sing'ha avatára, and perched upon the highest pinnacle of the mountain. A staircase hewn out of the rock, and adorned at intervals with smaller Temples and arches, leads to this singularly placed edifice. The Temple of Chillapulla Ráya, an incarnation of Kríshna, is also a building of large dimensions, surrounded by a lofty colonnade, and is said to have been repaired by Rámánuja Achárya, who flourished at the commencement of the XIth century. At the foot of the hill there is a fine reservoir, surrounded by buildings for the accommodation of pilgrims; and it is said that even Típu did not venture to touch the treasures in the Temple.

Tonoor.

11. Near to Máil Kótai, and forming one township with it, is Tonúru, their joint population, in 1801, consisting of 3153 families. The latter place is remarkable

for the remains of very ancient walls, which show that it was once of great extent, and for a vast tank, said to be the work of Rámánuja, and formed like the famous reservoir of Máreb, in Yemen, by an embankment between two mountains. Típu, in the hope of finding treasures, endeavoured to empty this reservoir by cutting through the dam; but it was repaired immediately after his downfall, and the country has since continued to recover its prosperity.

12. To the North-West of Tonúru, in $12^{\circ} 51' 15''$ North and $76^{\circ} 30' 17''$ East, is Sravana Belligóla, (for Sramana Belligagóla, *As. Res.* ix. 266.) the great sanctuary of the Jáinas, a remarkable sect who are considered as incorrigible heretics by the Bráhmans, inasmuch as they deny the authority of the Védas. On Indra betta, a rocky hill near the village, there is a Basti or Temple, and in a sacred enclosure at the summit is a colossal statue of Gautama, the God or defied saint of the Jains, measuring seventy feet three inches in height. (*As. Res.* ix.) The symmetry of the whole figure is well preserved, but the minuter details are ill executed. On the opposite hill, called Chandra-giri, (Mount Lunus,) there are no less than fifteen Basties; and there is also a large one in the populous and well-built village below. It is entirely inhabited by Jains, or followers of Jina, who have been often confounded with the worshippers of Budd'ha, from whom they differ in several tenets, though approaching in their doctrine much more nearly to them than to the Bráhmans. By the latter they are considered as heretics, not as mléch'has or infidels.

Sawun
Baitgool.
Jynes.

13. Near the confines of Kúrg, (Kóduga,) on the South-Western boundary of Mysore, in $12^{\circ} 20'$ North and $76^{\circ} 15'$ East, is Priyá-pattana, (the Beloved City,) once a fortress of some importance, but now in ruins. Its site is very elevated; and Bettáda-pura, a hill about eight miles North of it, is about 2000 feet above the level of the surrounding country, and 4350 feet above the sea. Notwithstanding this great elevation, frost seems to be unknown. In the woods near Hegodu Déva Kótai, about twenty miles South of Priyá-pattana, sandal abounds more than in any part of India. The billets are buried in dry ground for two months, that the white ants (*termites*) may consume the outer wood, the heart being its only valuable part; and a very high colour is a sure sign that it contains an abundance of the essential oil from which the odour arises. The largest billets are exported to China, the chips and smaller blocks to Arabia; and the trade in this wood is a royal monopoly.

Preaput-
tun.
Bettatipoor.

Sandal
wood.

ii. The principal places in the division of Bednór are:

1. Bidurúru, called by abbreviation Bidrúr, (whence Bidnúr,) and named Hhaider nagar (Hhaider's town) after it was taken by Hhaider 'Alí. It is placed in $13^{\circ} 49' 10''$ North and $75^{\circ} 3' 3''$ East, and is the chief town (kasbah) of a ta'alluk (district) bearing the same name. It became the seat of government on the decline of Ikkerí, and was then called Bidder-uru (Bamboo Place) instead of Bidder-hulli, (Bamboo Village,) its former name. It soon became very flourishing, being near the Hosso-angadi Pass, one of the best roads through the mountains, to the coast. It is said, when taken by Hhaider in 1763, to have contained 20,000 houses, and to have yielded plunder to his troops to the amount of £12,000,000 sterling. From him it received the name of Hhaider nagar, and by the latter of those words it is now generally called. In 1801, it contained 4960 houses, and 4870 families; and being favourably placed for commerce, has greatly revived since the

Bidooroo-
roo, Bidroor,
or Bednore.

MYSORE. restoration of the Kurtur. The district of Bidnúr, which is on the upper part of the Eastern side of the highest range of G'háts, is peculiarly exposed to rain, so that there are nine rainy months in most years. Its climate being so moist is favourable to the growth of timber, and for that reason the more unhealthy.

Ikkery. 2. About eighteen miles nearly due North of Bidnúr are the ruins of Ikkerí; its walls show the traces of three concentric enclosures like those of Súnda. It was voluntarily abandoned, and has never since been inhabited, though its coin and Princes still bore its name after it ceased to be their abode. It is thus described by Pietro della Valle, (*Viaggi*, iv. 179.) who visited it in 1623. "On entering Ikkerí, which is situated in a fine plain, we passed through three gates, with forts and narrow ditches, and consequently through three enclosures; the two first were not walled, but made of Indian reeds, planted very thick and close together, forming a strong defence against infantry and cavalry in every kind of attack, difficult to cut through and not easily burnt, (*ma non pericolose dal fuoco*.) forming, together with the plants creeping over them, a rich and beautiful verdure and a deep shade. The innermost enclosure was walled, but weak and of no importance. It is said that there are others also further inwards, if not in the city, at least in the citadel or fortress where the King resides, for Ikkerí occupies a very considerable space. The houses, however, are not numerous, as they are scattered and low, especially outside of the third enclosure, and the greater part of the ground is occupied by wide and very long streets, shaded by high and most beautiful trees, by pools of water, of which there are several large ones, by spaces filled with trees like a wood, and by other similar intervals between the buildings, so that it appears to be a compound of town, country, lakes, and woods all mixed together, very pleasing and delightful to behold." The house in which the Ambassador and his suite, whom Della Valle had joined, were lodged, was "in truth such," he says, "as scarcely an artisan in our Country would have dwelt in it; not only were its apartments very few, but extremely small, and so dark that there was not light enough to read a letter in them." Some better houses, however, were observed as they passed along. The citadel was of a considerable size, surrounded by a wide ditch filled with water. It was defended by some ill-built and weak bastions, and the entrance was very narrow and winding. There were houses and shops in streets within the citadel, at each gate of which a guard was stationed. At the Ambassador's audience there were many courtiers seated in the porticoes round a court to which the third gate led; and the fourth, through which all entered on foot, brought them into another small court, on the opposite side of which Venk-
tapà Nayekà was seated, in the middle of a portico, on a platform raised a little from the ground, beneath a square canopy of gilt-wood; an old carpet was hung round, and the Prince sat upon a mattress in the Eastern fashion leaning against two large cushions, covered with fine white muslin. (*bombacini*.) His sword, garnished with silver, was laid before him. The rest of Pietro della Valle's remarks, which are curious as descriptive of a Hindú town never subject to a Moham-

edan power, all show the depressed state of the **MYSORE**. Country, which was then divided into petty States continually at war with each other.

3. Hulli Hunáwer, or Honáúr, in 14° 16' North and 74° 32' East, is a moderate-sized fortified town with a square citadel: the surrounding country was well cultivated, and extremely populous before the Mahrattah invasion in 1792, when those improvident desolators boasted of having burnt ten villages a day during the whole time they were encamped there. In 1801, it had only 3219 houses, and as many families.

4. Ballam is a small district on the North-West confines of Mysore adjoining to Kúrg and Bidnúr, consisting of deep ravines and valleys covered with forests in the almost undisturbed possession of beasts of prey, and enclosed by lofty, naked mountains. It is a border territory never completely subdued, and rarely traversed till military roads were made through it by the British army in 1802. Being at a great elevation it attracts clouds and moisture from each side, and pours forth streams in almost all directions. It was till lately almost uninhabited, having scarcely a single village; but as the dominions of the Kurtur become more populous, these tracts on his borders will be gradually peopled.

iii. The division of Ch'hatra-kal has only one place of any note; Chatrakal, its Capital, commonly called Chattrakal, or Chitra durga, and by the Musulmans, Chitel drug. It is a celebrated town and fortress on a cluster of rocky hills, in 14° 13' 4" North and 76° 24' 56" East, forming the extremity of an elevated ridge, not however rising more than 800 feet above the plain. The fortifications of the pettah at its base, though strongly built, are somewhat dilapidated, and its population, consisting of 3824 families in 1801, is not yet very considerable. This fort is not only celebrated as one of the state prisons in which Tipú immured the unfortunate Europeans who fell into his hands, but as the most intricate and elaborate in its construction of any of the Indian fortresses known. The lowest fort, just above the pettah, has a fine reservoir supplied from a very spacious tank above, from which a perpetual stream supplied the town with water; a báúlí or well, many ancient buildings, and the pále-iagár's (chief's) palace, now occupied by the British commander, and banglás (temporary residences) for the officers. Six gateways in succession, one above the other, lead from rock to rock through a most perplexing maze of ramparts, all formed of granite, to the summit of the mountain, whence there is a bird's eye view from a vast height over this singular tissue of enclosure within enclosure and fort within fort, in the genuine Hindú style of military architecture. The strength of the place arises not so much from its height, as from the steepness of the mountain on which it stands, and in many places from the difficulty of the ascent—not simply by steps cut in the perpendicular rock, but partly by mere notches hewn out of its smooth surface. It is one of the few forts within the Kurtur's dominions retained by the British Government, as it is a connecting link in the great line of defence extending from the Eastern to the Western coast of the peninsula.

See the authorities for MADRAS and MAHRATTAH; and *Viaggi di Pietro della Valle*, Roma, 1663, 4 vols. 4to.

MYSTACIS.
—
MYSTERY.

MYSTACIS, in *Zoology*, a genus of *Trichopterous* insects.

Generic character. *Antennæ* very long and slender, setaceous; head small; *palpi* four, very hairy, anterior five-jointed; wings with the nervures slightly hairy, anterior narrowed, elongate; posterior small, longitudinally folded; legs long, with spurs at the apex of the tibiae; *tarsi* pentamerous.

Type of the genus, *Phryganea nigra*, Linnæus; Degeer, vol. iii. p. 424. pl. xv. fig. 21. Three indigenous species, all of which frequent marshy places, and, in common with the rest of the order, reside in water during their larva state.

MYSTERY,
MYSTERIAL,
MYSTERIOUS,
MYSTERIOUSLY,
MYSTERIOUSNESS,
MYSTERIZE,
MYSTICK, *adj.*
MYSTICK, *n.*
MYSTICAL,
MYSTICALLY,
MYSTICISM.

Fr. *mystere, mystique*; It. and Sp. *misterio, mistico*; Lat. *mysterium, mysticus*; Gr. *μυστήριον, μυστικός*. Vossius exhibits a variety of conjectures. The opinion of Eustathius, adopted by Lennep and Valcknaer, seems well founded. From *μυσταί*, the third person of the pret. pass. of *μύειν*, *claudere*, were formed *μύστης*,

qui claudit et celat, and hence *μύστηρ, μυστήριον, quod clauditur, et celatur*; that which is shut up, hidden, or concealed. And a *mystery* is, generally,

Any thing shut up, hidden, or concealed: and, consequently, that cannot be perceived or understood.

A *mystick*, one who pretends to *mysteries*; or doctrines or opinions that cannot be understood or comprehended.

And see MISTERY.

The more ich muse per on. the *mystiloker* hit semeþ.

Piers Plouhman. *Vision*, p. 190.

Honour and glorie be to him that is myghty to conferme ghout bi my gospel and prechyng of Iesu Crist bi the reuelacioun of *mysterie* holdun stille in tymes euerlastynge.

Wiclif. *Romaynes*, ch. xxvi.

To him that is of power to establishe you accordynge to my gospell and preachynge of Iesu Christe, in vtterynge of the *mysterie* whyche was keppe secrete sence the worlde beganne.

Bible, Anno 1551.

Preestes ben as angels, as by the *mysterie* of hir dignitee.

Chaucer. *The Persones Tale*, p. 165.

These thinges are *mistical* and not to bee vnderstoode but by Thauthour him selfe.

Gascoigne. *Dan Bartholmew of Bathe*, note.

This psalme was made of our sauour Christ, because it was not conueniente to descrybe hym without a *misticall* woorde, he calleth hym the dawninge, (or as some wyl,) the morninge starre.

Bible, Anno 1551. *Psalm 22*. notes.

I will explaine, that which being before *misticallie* couered, and commonly misconstrued, might be perellous in seducing you.

Gascoigne. *To the Youth of England*.

Beauty and Love, whose story is *mysteriall*,
In yonder palme-tree, and the crowne imperiall,
Doe from the rose and lilly so delicious.
Promise a shade, shall ever be propitious
To both the kingdomes.

Ben Jonson. *Love's Triumph, &c. A Masque*.

So the word *mystery*, though at first restrain'd to signify only a ceremony not to be divulged: yet by use (against which, to argue, is like disputing against matter of fact) whatever else is any way secret, or abstruse, either not at all, or not entirely, or not easily understood, is said to be *mysterious*.

Grew. *Cosmo Sacra*, book v. ch. vi. sec. 42. fol. 327.

[The cabalists] *mysterizing* their ensignes, do make the particular ones of the twelve tribes, accommodable unto the twelve signs in the zodiack, and twelve moneths in the year.

Sir Thomas Brown. *Vulgar Errours*, book v. ch. x. p. 304.

VOL. XXV.

Each stair *mysteriously* was meant, nor stood
There alwayes, but drawn up to heav'n sometimes
Viewless.

Milton. *Paradise Lost*, book iii. l. 516.

He caused us to be born of Christian parents, under whom we were taught the *mysteriousness* of its goodness and designs for the redemption of man.

Taylor. *Sermon 12*. part ii. fol. 113.

Fool, thou did'st not understand
The *mystic* language of the eye nor hand.

Donne. *Elegy 6*.

Mystical dance, which yonder starrie speare
Of planets and of fixt, in all her wheelles
Resembles nearest.

Milton. *Paradise Lost*, book v. l. 620.

Of which one's [Sybils] books twice scorn'd, thrice valu'd, bought,
Rome strictly kept with a religious care,
From which her fates she long with reverence sought,
As all characted *mystically* there.

Stirling. *Doomes-day. The fifth Houre*.

What master of reason or subtilty is able to unriddle the *mysteries* of the gospel; to track the *mysterious* workings of the Spirit in conviction and conversion?

South. *Sermons*, vol. viii. p. 381.

Could we have a more pregnant demonstration of a reconciled God, than a sacrificed son, nay than the blood of that son? and that so *mysteriously*, and yet so really, conveyed to us?

Id. *Ib.* p. 141.

A third cause of the unavoidable *mysteriousness* of the chief articles of the Christian religion is that most of them fall, neither within the common course of men's actings, nor the compass of their observation.

Id. *Ib.* vol. iii. p. 223.

The ceremonial law, with all its *mystic* rites (which, like the manger of the shepherds, holds forth wrapped in his swathing clothes the infant Jesus) to many, that bestow the reading on it, seems scarce worth it: yet what use the apostles made of it with the Jews?

Boyle. *Works*, vol. ii. p. 278. *Touching the Style of the Holy Scriptures*.

I profess not myself either skilled or delighted in *mystical* interpretations of scripture.

South. *Sermons*, vol. v. p. 52.

By a silent, unseen, *mysterious* process, the fairest flower of the garden springs from a small insignificant seed, the majestic oak of the forest from an acorn, the strongest and wisest man from a wretched, helpless, and senseless infant; the holy and exalted saint from a miserable sinner.

Horne. *Works*, vol. iv. p. 521. *Discourse 29*.

The beauty certainly is *mystic*,—the beauty of evangelical sanctity and innocence.

Horsley. *Sermon 8*. vol. i. p. 159.

Time was when, I knew not what, *mystical* meanings were drawn, by a certain cabalistic alchymy, from the simplest expressions of holy writ—from expressions in which no allusion could reasonably be supposed to any thing beyond the particular occasion, upon which they were introduced.

Id. *Sermon 1*. p. 1.

The epithet sublime is strongly and happily descriptive of the feelings inspired by the genius of that author; [Plato;] by the lofty *mysticism* of his philosophy; and even by the remote origin of the theological fables which are said to have descended to him from Orpheus.

Stewart. *Philosophical Essays*, ch. v. *Essay 2*.

MYSTERY is applied also to the earliest English Dramatic representations, because being first performed in Religious Houses, and by Ecclesiastics, at solemn Festivals, some *mysterious* subject, such as the Incarnation, Passion, Resurrection, &c. of our Saviour was usually selected. Matthew Paris calls them *Miracula*, because they represented Miracles; and in an improved state, when somewhat more of Fable and Invention was introduced, they became *Moralities*. The subject, which is full of curiosity and entertainment, but in which the chief interest would be destroyed by abridgement, is ably treated by Warton. Those who fastidiously object to the annual representation of a Latin Play, at one of our great Public Schools, are perhaps ignorant that it is a relic of very early Ecclesiastical Antiquity.

MYS-
TERY.

MYTHIM-
NA.
—
NAB.

MYTHIMNA, in *Zoology*, a genus of *Lepidopterous* insects.

Generic character. *Palpi* short, ascending, densely clothed with scales, the apical joint not exposed; tri-articulate, the basal joint scarcely one-third as long as the second, bent; the second very long, slightly attenuated towards the apex, not so stout as the first, a little curved; terminal small, elongate-ovate, subacuminate, conic; *maxillæ* as long as the *antennæ*; *antennæ* rather moderate, shortest in the female; finely ciliated in both sexes, stoutest and somewhat pubescent beneath in the males; head small, with a tuft of scales; eyes large, pubescent; *thorax* slightly crested anteriorly; body elongate, densely tufted at the apex, and also laterally in the male; somewhat obtuse in the females; wings slightly deflexed during repose, the anterior entire, acute at the apex, with the stigmata nearly or quite obliterated; posterior obsoletely emarginate on the hinder margin; legs moderate; *femora* and *tibiæ* stout and densely pilose in the males; *larva* naked, with longitudinal streaks; *pupa* subterranean.

Type of the genus, *Noctua turca*, Hübner, *Noct.* pl. xlv. fig. 218. Several species, four of which inhabit Britain.

But yet na force, all shal be for the beste.

Id. *Ib.* v. 4174.

NAB, in Swedish *nappa*, *prehendere*, to catch. Lye. It is of common use in vulgar speech. See NIP.

Nab-cheats: the beggars probably so called their caps or hats, because they caught in them what they obtained by cheating, or false pretences.

Hic. That thou art chosen, venerable Clouse,
Our King and Sovereign; Monarch o' th' Maunders,
Thus we throw up our nab-cheats, first for joy,
And then our filches.

Beaumont and Fletcher. *The Beggar's Bush*, act ii. sc. 1.

NABIS, in *Zoology*, a genus of *Hemipterous* insects.

Generic character. *Antennæ* four-jointed, inserted on the sides of the head, beneath an imaginary line drawn from the eyes to the origin of the rostrum, the latter with the first joint nearly as long as the second; head simple, ovate, with a distinct neck; *thorax* slightly convex above; body conic-ovate; legs moderate; *tibiæ* anterior, sometimes denticulated within.

Type of the genus, *Reduvius apterus*, Fabricius; Coquebert, *Icon.* dec. 3. pl. xxi. fig. 8. Several species, found in Europe.

NADDE, *i. e.* ne-had; had not.

And gut was Wyllam's grace fulke day so gode,
pat he nadde no wounde, war þoru he ssedde an drop blod.
R. Gloucester, p. 363.

NADDE

NAJA.

"Alas!" (quod he,) "that I n'adde here a knave,
That coude climbe, alas! alas!" (quod he)
"For I am blinde."

Chaucer. *The Marchantes Tale*, v. 10212.

NÆNIA, in Zoology, a genus of *Lepidopterous* insects.

Generic character. Palpi rather long, porrect, ascending, triarticulate, the two basal joints clothed with elongate capitate scales, terminating in an acute point anteriorly at the apex of the second joint; apical joint slender, elongate, exposed, covered with abbreviated scales; basal joint of equal length with the terminal, and slightly curved, the second nearly as long again, more slender than the first, a little attenuated at the apex; terminal linear, very slender, slightly acuminate; *maxillæ* longer than the *antennæ*, the latter short, slender in the females, ciliated internally in the males; head small, with a crest between the *antennæ*; eyes rather prominent, naked; *thorax* stout, with an anterior and posterior crest; *abdomen* slightly depressed, with a carina in the male; wings incumbent, faintly denticulate on the hinder margin; legs short, rather stout; *larva* naked, with the anal segment a little elevated; *pupa* folliculated, with a single spine at the apex.

Type of the genus, *Ph. Noctua typica*, Linnæus; Albin, pl. xv. fig. 21. One species only, which is a native of Britain.

NÆSA, in Zoology, a genus of *Isopodous Crustacea*.

Generic character. *Antennæ* four, setaceous, subequal, upper ones with a very large biarticulated peduncle, the basal joint largest; head distinct; jaws

three pair; body depressed, six-jointed, the last segment largest, and furnished on each side with a subcompressed process attached to a peduncle; legs fourteen; claws bifid.

Type of the genus, *N. bidentata*, Leach; *Linnæan Trans.* vol. xi. p. 367. One indigenous species, found on the coasts of Wales, Devonshire, and Kent.

NÆVE, Lat. *nævus*; Fr. "Neve. A mote, freckle, or other the like natural mark or blemish on the body. Cotgrave."

Was there no milder way but the small-pox,
The very filthiness of Pandora's box?
So many spots, like *næves* on Venus' soil.

Dryden. *Upon the Death of Lord Hastings*.

NAG, D. *negge*; Ger. *nack*. As the Lat. *hinnulus* was so called *ab hinniendo*, so *nag* from the A. S. *hnegan*, to neigh. Generally,

An animal that *neighs*; a horse; usually, a horse of small, handy size.

With them other folkis of the cōutrey, with lytle *nagges*, charged with brede euyll bakyn, in panyers, and smalle pere wyne in barels.
Lord Berners. *Proissart*. *Cranycle*, ch. xviii.

Mincing poetrie;

'Tis like the forst gate of a shuffling *nagge*.

Shakspeare. *Henry IV. First Part*, fol. 61.

NAGEIA, in Botany, a genus of the class *Dioecia*, order *Pentandria*, natural order *Rhamni*. *Generic character*: male flower, calyx four-leaved; corolla none; female flower as the male; style two-cleft; drupe one-seeded.

Two species, natives of Arabia and Japan.

N A J A.

NAJA, from the Indian word *Nagou*, a poisonous Snake, Laurenti; *Hooded Snake*. In Zoology, a genus of animals belonging to the family *Serpentes*, order *Ophidia*, class *Reptilia*.

Generic character. Poison fangs in the upper jaws, and enclosed in a doubling of the gums, when at rest; mouth very extensible; nose truncated, back of the head wide; head covered with large scales; neck opposite the space included between the sixth and twelfth abdominal scales dilatible into a kind of hood supported by the ribs; beneath the tail a double row of scales.

The Snakes forming this genus were originally included among the Vipers; from which, however, they were separated by Laurenti, on account of the remarkable power they possess of expanding the neck into a kind of hood when irritated. This is effected by inflation of the lungs; and Dr. Russel says, that although the neck is thus remarkably spread out, the expansion is not merely confined to that part, but that it extends throughout the body, so that all the scales from the head to the tail are separated from each other, and the skin is seen between them. It may also be further noticed with reference to the hood, that its expansion is assisted by the greater length of the ribs attached to this part of the trunk than in other kinds of Serpents, and that behind the hood they gradually diminish in length, before they again enlarge to form the longer abdominal ribs. When, however, the Snake is at rest, and continues unexcited, the neck does not appear larger than in Serpents generally. When disturbed they spring upright, raising themselves almost on the very extremity of the tail. They are highly venomous, as will be seen

from the subsequent observations, and cause death very speedily after the infliction of their bite. The motions of these animals are performed by two or three undulations of the posterior third of the body, whilst the two anterior thirds are held erect, giving to the animal a very majestic appearance. They have been said to be found in America, but more accurate observations show that they exist only in Asia and Africa. At present there are but two distinct species known; one of them, however, includes several varieties.

N. Lutescens, Laur.; *Coluber Naja*, Lin.; *la Vipère à Lunettes*, Daud.; *Cobra de Capello* of the Portuguese; *Spectacle-hooded Snake*. This animal measures four feet in length including the tail, which is about nine inches long; and the circumference of the body is about four inches; the top of the head is flat, and sloping a little towards the nose, and is covered with nine broad scales disposed in four rows, the first row nearest the nose consists of two, as does also the second, three are found in the third, and two in the last row: behind the eyes the scales are similar to those on the back, which are small, oval, smooth, polished, and increasing in size, except towards the hind part of the upper surface of the tail; and when the animal is in repose are all imbricated or overlapping each other like tiles; the tail, which is cylindrical and tapering to a point, is covered with nearly circular scales; of the long, transverse, single scales beneath the belly there are one hundred and eighty-five; and on each side of the belly, close to the abdominal plates, is a double row of broad, oval, imbricated scales; beneath the tail fifty-seven pairs of hexagonal scales may be counted. The membrane

NAJA. of the hood, when expanded, is about three inches wide, and upon it the scales are placed in longitudinal rows, slightly separated from each other. The general colour is yellowish or light brown, but in particular postures the scales assume a bluish-ashy tinge, and those of the belly are white with a reddish tinge: the colour of the skin beneath is white or pale orange. The most remarkable character, however, of this species is the spectacle-like mark observable on the back of the hood, consisting of two parallel black streaks, separated by an intermediate white badge, marking out the rings of a pair of spectacles, slightly separated from each other, black in the centres, and connected by a double arc, the convexity of which faces backwards, and in each leg of the arc is a small black spot. The form of the spectacles varies, and sometimes does not exist at all. When the animal is at rest, and the hood not expanded, these marks are not very striking; but when enraged, and the hood inflated, the scales become separated, and the spectacle figure, which is partly produced by the colour of the skin, becomes more distinct. Lacépède mentions that there is also beneath the neck, at its junction with the body, a broad brown collar, corresponding to the marks on the upper surface of the hood.

Of this species there are several varieties; Laurenti describes six and Lacépède a seventh, but Russel describes eleven by their native names; viz.

a. The *Chinta Nagou*, the Snake just described.

β. The *Arege Nagou*, in which the spectacles are grey in the centre surrounded with black, but the legs of the arc unspotted; on the under surface of the neck, corresponding to the spectacles, a pair of black spots; the cervical scales are of a more dingy colour.

γ. The *Coudum Nagou* has the external form of the spectacles marked with a double arc; the rings, however, being still depicted with a black circle within. In this variety the colour is more sombre and the skin more yellow. The neck, when expanded, resembles the section of a pear, with the broadest part uppermost.

δ. The *Sankou Nagou* has no mark of any kind on the hood; it was erroneously considered by Seba as the female of the *Chinta Nagou*. Laurenti, on the contrary, describes it as a distinct species, and calls it *Naia Non-naja*.

e. The *Mogla Nagou*, in which the cervical scales are marked with pale greyish spots, and the middle four scales bluish-grey.

ζ. The *Malle Nagou*, of a light brown colour; the scales on the under part of the body white, excepting seven pectoral, which are black; the spots small.

η. The *Combou Nagou*, in which the form of the cervical scales varies; many of them are dusky, and shining with blue.

θ. The *Jonna Nagou* has the skin of the hood orange; the scales near the under part of the neck are spotted with grey, and at least six of them are entirely greyish-blue.

ι. The *Nella-tas-pam*, of which the black of the hood is very deep; the scales on the throat very dusky.

κ. The *Kistna Nagou* has the three middle scales between the eyes very broad, and the posterior pair slightly oval instead of heart-shaped; five of the scales on the throat embrowned, and six are black.

λ. The *Korie Nagou* has the three middle scales between the eyes very narrow, and the posterior pair broad and oval; the colour of the body, and especially that of the scales, of a remarkable blue.

NAJA. According to the observations of Russel, the Spectacled Snake is one of the most poisonous Snakes of India, although it does not destroy so soon as the Rattle Snake; much, however, depends on the part bitten as to the speed with which death ensues. The animal bitten, usually about ten minutes after its wound, is unable to support itself, and in five minutes from this becomes stretched on the ground as if asleep; convulsions come on, and it dies in half an hour. In his experiments on Dogs a curious circumstance occurred in one instance, in which, after a Dog was bitten by a Spectacled Snake, it was made to hunt for an hour and a half; being then much fatigued and panting, it was allowed to remain at rest, but it refused water which was offered to it, although it swallowed some morsels of soaked bread. In a quarter of an hour after it became sick, vomited, howled, and seemed very uneasy; in ten minutes after it vomited a second time, assumed a furious appearance, and attacked the stake to which it was tied, but did not cease howling; convulsions in the muscles of the face were observed; at the end of three hours it became so furious that it was necessary to tie its legs. From this time it became worse, the muscles of the face were more and more convulsed; it languished in this state for an hour, and then died. The close resemblance here to the symptoms of Hydrophobia is very remarkable, but does not admit of any satisfactory explanation.

It may naturally be supposed that to escape the deadly consequences of this Snake's bite, there is no lack of disposition to exhibit remedies, and many and various are the means which have been resorted to and extolled by their often mistaken discoverers. Kœmpfer highly praises the plant called Mungos by the Indians, the *Ophiorriza*, which in hot climates is considered as a specific against the poison of Snakes, Scorpions, and mad Dogs; and the discovery of its anti-venomous properties are said to have originated in observing the Indian Ichneumon, or *Nems* of the Indies, resorting to it when bitten by the Spectacled Snake. Russel, however, totally contradicts its asserted efficacy as an antidote, and among all the remedies with which he had made experiments, most strongly recommends the *Tanjore Pill*, used by the inhabitants of Bengal. It consists of equal parts of white arsenic, the roots of the Velli-navi and Neri-visham, of the kernels of the Nervalam, pepper, and quicksilver; the latter to be rubbed down in the juice of the wild cotton plant (*Asclepias gigantea*) until the globules have disappeared, when the other ingredients are to be added, and beaten up to the consistence of pills. The kernels of the Nervalam are believed to be a species of Croton, but what the other plants are is unknown. The dose of this medicine to be taken by a person who has been bitten by a Spectacled Snake, is, one dram mixed in a little warm water; if at the expiration of a quarter of an hour the symptoms become aggravated, two drams more are to be exhibited; and if this be inefficient, a fourth dram is to be given an hour after, which is generally all that is required. At the same time it is directed that the wound should be opened and the warm liver of a fowl applied. The patient must follow a strict diet for six days, consisting of rice, and the water in which it is boiled, or rice milk; he should eat no salt, and only drink warm water. During the first twenty-four hours he should not be allowed to sleep. Russel mentions, on the authority of Duffin, two cases of men cured by this remedy. He also relates another case in which the patient was cured

NAJA. by dosing him with Madeira wine; a soldier having been bitten in the ankle, the wound was washed with *eau de luce*, and he was made to swallow two bottles of Madeira warm, which was introduced into his throat by means of a funnel, his jaws being closely locked with spasm: during three hours the wound was incessantly washed with *eau de luce*; he continued in a state of stupor for twelve hours, which Russel attributed rather to the effect of the wine than of the poison, as most people would naturally imagine. Some persons after washing the wound give two drams of Fowler's arsenical solution, (which contains a grain of arsenic,) ten drops of laudanum in an ounce and a half of peppermint water, to which half an ounce of lemon-juice should be added, and the draught taken whilst effervescing. This to be repeated at intervals of half an hour for some time. The wound to be anointed with a liniment consisting of half an ounce of spirits of turpentine, the same of liquor of ammonia, and an ounce and a half of olive oil. Boag, in the *Asiatic Researches*, vol. iv., recommends the use of lunar caustic as a specific; and Williams, in the following volume, the employment of caustic volatile alkali both internally and externally.

Great faith was formerly placed in India in the efficacy of certain substances which were called Snake stones, Cobra stones, &c. in curing bites of the Spectacled Snake. They were said to be found in the head of this Snake; in appearance they were smooth, shining as if varnished, black like touch-stone; some having a grey spot on one, others on both sides, some being entirely black, others having a little white in the middle, and others being completely encircled with a bluish tinge; as to shape they are generally of a lenticular form, but some are oblong. Redi mentions them in a Paper contained in the fourth volume of the *Collection Académique*, but considers them as merely composition, and his opinion was verified by Fontana. The pretended stones seem to be balls of argillaceous earth, capable of quickly absorbing moisture; and thus the Indian notion of their sucking up the poison contained in the body of the person bitten, and bringing it to the orifice of the wound, is easily accounted for.

It is an interesting fact, notwithstanding the danger to which people are exposed by the bites of these animals, that they are commonly employed by the jugglers of India for public exhibition, after having been taught to perform certain, even elegant, motions. The Snakemen, as these persons are called, pretend that they have the power of charming them with music, and never use in their shows any other poisonous Snake than the Spectacled Snake. The Snakeman, squatting upon his heels, and playing on a pipe with his left hand, raises the lid of the vessel in which the Snake is contained, which soon coming out from it, commences its dance, varying its motions according to the sound of the pipe, and the motions of the master's right hand, in which the cover of the vase is held; after a performance of a short time, the dance ceases, and the animal returns to its resting place. Kœmpfer, in his *Amœnitates Exoticæ*, has given the following entertaining account of the proceeding. The juggler having attracted a crowd around him by promising an exhibition such as has been never before seen, takes a piece of some kind of root, of which he always carries a stock, at the same time assuring the spectators that by virtue of this root he can attack the snake with impunity, and cure himself of any poisonous bites. He then takes the Snake from a vessel in which

it is kept shut up, and irritates it by a slight stroke with a whip, or by presenting to it his right hand closed, in which he holds the root before mentioned. Immediately the animal turns towards its tormentor, raises itself on its tail, swells out its hood, and with open mouth and fiery eye intently watches the closed hand of the juggler, who immediately commences his song, and moves his fist in time to the music, carrying it now from right to left, and back again from left to right, and sometimes moving it up and down. The Snake closely observing the hand presented to it, imitates all the motions with its body, so that the tail being always steadily retained on one spot, the head continually varies its position, producing a pleasing kind of dance which is kept up for about a quarter of an hour; after which the juggler, who is well aware how soon the animal will drop from exhaustion, breaks off his song, ceases moving his hand, and the snake falls on the ground, upon which he replaces it in the vessel from which it had been taken.

It requires no reflection to be assured that the root employed by the juggler has no power to protect him from the bite of the serpent, and that the music does not excite it to dance; but that education is necessary to teach the animal to perform these curious movements. Kœmpfer witnessed the method employed for this purpose by a Brahmin, who afterwards sold his accomplished pupils to the jugglers; it was as follows: having obtained twenty-two Spectacled Snakes, he placed them in as many earthen pots with covers, of sufficient size to allow the animal room to turn round. He then chose that time of day when the heat was moderate, and having driven the Snakes one after another from their new habitations, exercised them a longer or shorter time, according as they were less or more easily taught. When the Snake first comes out of the vessel and attempts to escape, the teacher by a slight stroke with a switch turns its head round towards himself, and at the moment the animal prepares to strike at him, he presents the vessel which he retains in his hand, as a kind of shield, to parry its blows, till at last, wearied by its futile attacks, the Snake ceases from the contest. This kind of fight is continued for a quarter or half an hour, and during this time the animal keeps its hood inflated, and showing its teeth, follows all the motions of the shield opposed to it. In this way, by little and little, the Snake is taught to elevate itself whenever the jar is presented to it; but subsequently the fist is substituted in place of the jar, and the animal respects it from fear of dashing itself against the obstacle, which it has incessantly before its eyes. The juggler thus provided with a dancing Snake, accompanies its dance with a song to complete the illusion of the exhibition.

But however clever the exhibitor may be in avoiding the attacks of the dancing reptile, it is hardly possible for him to escape being occasionally bitten, which would cost him his life, were he not to take the precaution of previously depriving it of its poison by irritating it with pieces of cloth on which it discharges that deadly secretion. A day or two after this operation the exhibition is made, care having been taken that during the intermediate time, the snake should not feed on any fresh grass, by which the poison would be generated in a few hours. By this sleight the conjuror ensures his life, and if he should be accidentally bitten by the Snake, the bite is so trifling that the wound speedily heals without inconvenience.

The Spectacled Snake, like most other animals, has

its worshippers in India; and in a description of Malabar, quoted by Daudin from the XLIII^d volume of a French Work in 12mo. entitled *Histoire Générale des Voyages*, an account is given of the worship paid to it by the inhabitants of that Country. The Indians of Malabar call that reptile *Nalle Pambou*, or Good Snake, which is known to the Portuguese by the name of *Cobra de Capello*, because its head is surrounded with a spreading skin which forms a kind of hat. Its body is enamelled with brilliant colours, which render its appearance as beautiful as its bite is dangerous; these, however, are not mortal unless neglected. The various representations of these cruel animals form the most elegant ornaments of their pagodas, and to them they present their prayers and offerings. A Malabarian who finds a Snake in his dwelling, first prays it to retire, but if his prayers be unavailing, he induces it to withdraw by offering to it milk or some other food; if, however, it still obstinately remain, the Brahmins are called in, who eloquently set forth those reasons which should influence it to listen to their entreaties, such as the respect in which it is held, and the adoration which is paid to all its kind by the people of Malabar. During the time that Dellon was at Cananor, a Secretary of the reigning Prince was bitten by one of these Hooded Snakes, which was as thick as a man's arm, and about eight feet in length. At first he neglected to employ the usual remedies, and those who accompanied him were satisfied with returning to the town, carrying with them the Snake in a well-covered vessel. The Prince much grieved by the accident sent forthwith for the Brahmins, who represented to the Snake how important the life of this faithful officer was to the State; to prayers they added menaces, declaring to the animal that if the patient died it should be burned on the same funeral pile; but it remained inexorable, and the Secretary died from the violence of the poison. The Prince was excessively grieved at his loss, but considering that the dead man might, perhaps, by some secret sin have provoked the anger of the Gods, he ordered the vessel containing the Snake to be carried forth from the palace, and the animal to be set at liberty after making it many apologies and profound reverences.

N. Haje, Laur.; *Coluber Haje*, Lin.; *la Vipère Haje*, Daud. *Nescher* of the Arabs; *Aspick*. Two feet in length, one-fourth of which belongs to the tail: the scales on the upper part of the neck, the body, and tail are slightly carinated in form of a lozenge and nearly hexagonal, whilst those on the sides are smooth, rounded and rather larger; the abdominal scales are two hundred and six, the caudal sixty according to Hasselquist, whilst Daudin gives two hundred and four to the former

and ninety-eight double ones to the latter. The colour is black, with the posterior half of the scales and the oblique bands above whitish. When approached, this Snake raises itself upright, which led the ancient Egyptians to consider it as the guardian of the fields in which it was found; they employed it as the emblem of the protecting Deity of the World, and sculptured it upon the porches of their Temples on either side of a globe.

This species is made use of by the Egyptian jugglers for dancing exhibitions similar to those of the Spectacled Snake, but although they take the precaution of drawing its fangs they are very careful to avoid being bitten. They also perform the trick of changing it into a stick, by pressing it close behind the head, producing a kind of epilepsy.

There has been much dispute to what genus belongs the *Aspick*, famous for having been the "poor venomous fool" by which Cleopatra destroyed herself; Cuvier, however, thinks it certainly was this species of *Naja*.

Daudin imagines the Snake called the Pof Adder (Puff Adder) by the inhabitants of the Cape of Good Hope to be the same as the *N. Haje*. This has been described by Burchell under the name of *Vipera Inflata*; and the brief account he gives is merely that it is "dusky and varied throughout with transverse, angular, or wavy white and black stripes; that it attains four feet and a half in length, and is from two to three inches thick." He further mentions, that "its venom is said to be most fatal, taking effect so rapidly as to leave the person who has the misfortune to be bitten, no chance of saving his life, but by instantly cutting out the flesh surrounding the wound. . . . There is a peculiarity which renders it more dangerous, and which ought to be known by every person liable to fall in with it. Unlike the generality of Snakes which make a spring, or dart forward when irritated, the Puff Adder, it is said, throws itself backwards; so that those who should be ignorant of this fact would place themselves in the very direction of death, whilst imagining that by so doing they were escaping the danger. The natives by keeping always in front, are enabled to destroy it without much risk." Burchell, *Travels in South Africa*, vol. i. p. 469. This Snake hisses very loudly, and has been said by the Dutch Colonists at the Cape to spit out its poison to some distance, which is an exaggeration; they have, however, from this circumstance also given it the name of *Spoog-slang*.

See Laurenti *Synopsis Reptilium*; Patr. Russel, *An Account of the Indian Serpents of Coromandel, &c.*; Daudin, *Histoire Naturelle des Reptiles*.

NAIADES, from *ναειν*, to flow, were strictly Nymphs of running streams, and are employed by Ovid, we know not why, to provide a soft bed of turf for the infant Adonis so soon as he uttered the first cry after his very uncomfortable birth. (*Metam.* x. 513.) Claudian picturesquely introduces such of these Nymphs as inhabit the golden-sanded Hermus sporting as Bacchantes.

*Quales referunt Baccho solennia Nymphæ
Mæoniæ, quas Hermus alit, ripasque paternas
Percurrunt auro madidæ; lætatur in antro
Amnis, et undantem declinat prodigus urnam.*

De Raptu Proserp. ii. 67.

So also by Strabo (x. p. 468.) they are reckoned, together with Silenus, the Satyrs, and his other customary attendants among the *πρόσπολοι* of Bacchus.

The Cave of the Naiads described by Homer (*Od.* N. 103.) is a most delicious spot, wrought with natural marble basins, and cool with everflowing fountains. The Nymphs use it as a boudoir in which they spin, and of its two entrances, that towards the South is untrodden by any mortal foot. In the *Æneid*, (xii. 139.) we find Juturna, the sister of Turnus, gifted by Jupiter with Naiadship, as a sort of love-token, and her story is more

fully told by Ovid, *Fasti*, (ii. 585.) In the VIth Eclogue (20.) we read of *Ægle* as the fairest among those Nymphs; a compliment paid her, as we imagine, solely because she happens to be present, and by no means to the disparagement of the remainder of the Sisterhood. Of their reputation they do not appear to have been over solicitous, and the progeny assigned them was not likely to increase it. The Satyrs are declared by Nonnus to be their children, and the God of Gardens himself has been reckoned among that number. We have noticed above, that *strictly* they presided over running streams, but there were subgenera which belonged to Lakes and other Waters, *Crenees*, *Limnades*, *Pegees*, &c., and some are placed by Statius among even the gloomy currents of the Infernal Regions. That Poet is consoling a Friend on the Death of a beautiful youth, and among other pleasing occupations in which he supposes the shade of the deceased to be employed, he notices

— aut illi per amœna silentia Lethes
Forsan AVERNÆ alludunt undique Nymphæ
Naiades. *Sylvar.* ii. 6. 101.

Spence has described these Nymphs very agreeably, and little perhaps can be added to his account. "Every River-god was supposed to be attended by several Goddesses of an inferior nature, called Naiads; of whom (as I observed to you in the case of the Nereids) the Poets say scarce any thing that is particular. What we learn of them in general is, that they were supposed to live in the palaces of the presiding Deities of Fountains, Lakes, and Rivers. (Ovid, *Met.* xiv. 332.) We have the names of no less than sixteen of these Deities given us by Virgil, (*Georg.* iv. 336, &c. 343.) in his account of Cyrene's apartment only, in the watery palace of Peneus: and Ovid speaks of a hundred, at least, (*Amorum*, iii. 6. 64.) in the river Anio. They had often a name (Statius, *Thebaid.* ix. 319. Ovid, *Fasti*, ii. 597.) from the particular river they inhabited. They are described with long, bright hair, flowing down their shoulders; (*Georg.* iv. 347.) their faces should have a shining humid look, (not unlike the *Venus Anadyomenè* of Apelles,) their shape should be fine, and their limbs well turned. Their robes, when they wear any, (for they are most commonly quite naked,) should be of a greenish cast, (Valerius Flaccus, *Argonaut.* iii. 526.) varied at pleasure, some into lighter, and some into darker shades; and so thin that you might discover all the turn of their limbs, and the fineness of their skin through them. They have sometimes little flying veils (in gems of the Ancients) over their heads; like those Goddesses of the Air, which the Romans called *Auræ*, and which we call Sylphs. Ovid dresses his Naiads with a good deal of variety (*Fasti*, i. 410.) where he introduces them as attending at a feast. Indeed, this was their usual employment, and (to say the truth) they seem to have been little better than so many domesticks to the presiding Water-deities. Almost all that we hear of them is, that they are lodged in their palaces, work, (*Georg.* iv. 349.) and tell stories together, and then come and (*Polymetis*, p. 236.) wait at table. (*Ibid.* 379. Ovid, *Met.* viii. 572.)"

NAIAS, in *Botany*, a genus of the class *Monoecia*, order *Tetrandria*, natural order *Naiades*. Generic character: male flower, calyx two-lobed; corolla four-cleft; anthers sessile, cohering; female flower, no calyx or corolla; style subulate; stigma two or three cleft; capsule one to four seeded.

Two species, natives of the South of Europe.

NAIL, v. } D. *naeghel*, *naeghelen*; Ger. *nagel*,
NAIL, n. } *nageln*; Sw. *nagel*, *nagla*; A. S. *nægl*,
nægl-an, *ge-næglian*: the nail of the hand is derived by Skinner and others from the A. S. *gnæg-an*, to gnaw; Skinner assigning as a reason, that they are gnawed by contemplative and uncleanly persons. A nail (sc. of iron) he composes of the D. *nae*, *ad*, and the A. S. *ecge*, an edge. Wachter has no doubt that they are the same word: the nails of man and animals (he observes) *videntur infixæ tanquam clavi*; and the *clavus*, he is convinced, received its appellation from that part where it ends in a point, and may be infixed in wood, and this leads him to the Gr. *νύττειν*, *pungere*, *fodicare*; to pierce, to dig.

It is not improbable that the word itself, *nægl-ian*, signified to fix or fasten, to infix.

To nail is now, by usage, to drive in a nail, to fix or fasten with nails; to cover with nails; met. to fix or fasten, to keep or hold close or tight to.

For Jamys þe gentil suggest in hus bokes
þat feith with oute fet. [fact] ys febelere þan nouht,
And ded as a dore nayle.

Piers Plouhman. Vision, p. 22.

And he seide to hem, but I se in hise hondis the fitchyng of the nailis, and putte my fyngir into the place of the nailis, and putte myn hond into hise side, I schal not beleue.

Wiclif. John, ch. xx.

And he said unto them: excepte I se in hys hâdes the prent of the nayles, and put my fynger in y^e holes of y^e nayles, and thruste my hâde into his syde, I wil not beleue.

Bible, Anno 1551.

He is now ded, and nailed in his cheste,
I pray to God to yeve his soule reste.

Chaucer. The Clerkes Prologue, v. 7905.

And som han driven nailis in hir brain,
While that they slepe, and thus they han hem slain.

Id. The Wif of Bathes Tale, v. 6351.

Our Hoste gan to swere as he wer wood;
"Harow!" (quod he) "by nailis and by blood,
This was a false cherl, and a false justice."

Id. The Pardoner's Tale, v. 12222.

In the end being well apposed; they were found to be but false dissemblers, wherefore by doome of that councell, they were iudged to be nailed vnto a crosse.

Holinshed. Henry III. Anno 1222.

So that the King, for any thing that he has to do in these matters, may sit and blow his nails; for use them otherwise he cannot.

South. Sermons, vol. v. p. 218.

I have seen several boys, under twenty years of age, who had never exercised any other trade but that of making nails, and who, when they exerted themselves, could make, each of them, upwards of 2300 nails in a day.

Smith. Wealth of Nations, book i. ch. i.

He drank, he slept extended on the floor.
She smote the warrior, and he wak'd no more:
Low at her feet he bow'd his nail-pierc'd head.

Fawkes. The Song of Deborah.

NAIRNSHIRE, a County of Scotland, bounded on the North by Moray Frith; on the East and South-East by Elginshire; on the South-West and West by Inverness-shire. It lies between 57° 22' and 57° 40' of North latitude, and between 3° 35' and 4° 7' West longitude; is 20 British miles in length from North to South, 13 miles in breadth from East to West, and has an area of 198 square British miles, of which it is computed that 58 square miles consist of arable land, 13 of natural wood, and 6 of plantations.

The land adjoining to the coast is more level and fertile than that of the interior or Southern part, where the

nature of
the Country

NAIRN-SHIRE.

country rises into a hilly tract, with a surface generally of sand or gravel, in few places admitting of profitable culture. Extensive moors overspread some of the ranges of hills, and are well stocked with grouse, and such other game as usually frequent heaths. The maritime and more level tract has a soil of rich, friable loam lying on a stratum of sand. In some places along the coast much mischief has been done by sea-sand, which, drifted inland by the wind, has overwhelmed considerable tracts of land previously fertile, and has accumulated here and there into hills varying from one hundred to four hundred feet in height. The species of grass, called by the country people *bent*, is the natural growth of such places, and wherever it is allowed to spread over the surface, binds it, and prevents the sand from moving; but as it forms a useful material for mats and similar wares, it is torn up by people who gain a livelihood from its sale. In addition to stopping this practice, it has been recommended to plant the bent grass carefully, and to enclose the sandy tract with a belt of fir trees, which grow well in such a soil; but none care to encounter certain trouble and expense to provide against a contingent calamity, so the evil continually increases. The finest part of the country is that lying on each side of the lower part of the river Nairn, where, among other plantations and woods, the noble forest of oaks surrounding the Castle of Calder receives the particular notice of the traveller, since it is the last place, as we proceed Northward, in which those trees exhibit vigorous growth. There are several small lakes dispersed over the country. The river Nairn, rising in the Highlands of Inverness-shire, traverses the County in a Northern direction, and falls into the sea at the port of Nairn, after a course of about forty miles. The Findhorn, a shallow and rapid stream, rises in the same range of mountains as that which sends forth the Nairn River, and having run nearly parallel to it, and in the same direction, passes into Elginshire, where it falls into the sea at the town of Findhorn. There are many smaller streams, for the most part tributary to these two principal channels. Much of the County is bleak, and disfigured by want of timber, which is, however, found to succeed well with judicious management, one part of which is to plant the deciduous trees within an encircling grove of the hardier Scotch fir. The timber is generally oak, ash, alder, mountain-ash, birch, and various sorts of pines and firs. The principal fuel is peat, the supply of which, afforded by the extensive moors and mosses, has little other limit than the tediousness of drying, and the labour and expense of cutting and carriage. Coal, imported at Nairn, is used in the vicinity of that town.

Rivers.

Woods.

Farming.

The live stock throughout the County is in general diminutive, the black cattle, when fatted, not exceeding two hundred weight; the horses being seldom more than nine hands high, and even few reaching that size, and the sheep seldom weighing eight pounds per quarter. Their numbers, as stated by Donaldson, are black cattle 11,000, horses 4000, sheep 18,500; most of the wool is manufactured by domestic labour into bed clothes and apparel. The agriculture is in general rude and inefficient, performed by the old-fashioned and inconvenient Scotch plough, drawn by six or eight small and feeble oxen. The carriage used for farming purposes is the *kellock*, a large wicker vessel placed on two clumsy wheels, and drawn by a single ox or horse. The crops are usually bere, oats, rye, or potatoes.

The only collection of dwellings within this County,

to which the name of town can be applied, is Nairn, situated at the mouth of the river of the same name. Although the Shire-Town and a Royal Borough, it is a small place, not containing above 2000 inhabitants, supported principally by the fishery in Moray Frith. The air of the town is considered dry and very salubrious, which circumstances, as well as convenient sea-bathing, attract visitors during the Summer months. In conjunction with Inverness, Forres, and Fortrose, it sends a Member to Parliament. Distant 167 miles North by West of Edinburgh.

Lord Cawdor resides at Calder Castle, seated at the confluence of the rivulet of Calder with the Nairn. The tradition of the neighbourhood assigns this as the scene of the murder of Duncan, but celebrity, conferred by the noblest Drama of the greatest of Dramatists, is too enviable to be enjoyed without rivalry, and the more general opinion is that the deed was done at Glames, in Forfarshire. The village of Auldearn was signalized by the victory which, in 1645, Montrose gained over the troops of the Covenanters. Nairnshire contains the Parishes of Ardelach, Auldearn, Calder, and Nairn, and parts of the Parishes of Ardersier, May, with Dalarossie and Urquhart. The total rental is estimated at about £15,000 per annum. In conjunction with Cromartyshire it returns a Member to Parliament. Population, in 1821, 9006.

He slombred, and a *nappe* he toke.

Id. The Romant of the Rose, p. 200.

"I am going to S. Thomas of Acres to the sermon, I could not sleepe all the last night, and I am going now thither, I never fayled of a good *nap* there:" and I had rather ye would goe a *napping* to the sermons, than not to goe at all.

Latimer. Sermons, p. 70. col. 2. The sixth Sermon before King Edward.

Why doest thou weare thy body to the bones?
 And mightest at home slepe in thy bedde of downe,
 And drinke good ale so *nappy* for the nones.

Wyat. How to use the Court, &c.

You are taken *napping* now.

Beaumont and Fletcher. The False One, act iv. sc. 1.

LUC. Faith—and you say the word, we'll e'n sit downe,
 And take a *nap*.

HUM. 'Tis better in the town,
 Where we may *nap* together.

Id. The Knight of the Burning Pestle, act ii. sc. 1.

But lest it should again be said,
 When I have once more won thy head,
 I took thee *napping*, unprepar'd,
 Arm, and betake thee to thy guard.

Butler. Hudibras, part i. can. 3.

And see! delighted, down he drops, secure
 Of sweet refreshment, ease without annoy,
 Or luscious noon-day *nap*.

Shenstone. Economy, p. 3.

NAP, n. } A. S. *hnoppa*; D. *noppe*; Sw. *nopp*.
NA'PERY, } Perhaps the same word as *knap*, *knop*,
NA'PLESS, } or *knob*, (q. v.) Any thing rising; ap-
NA'PKIN. } plied to

The soft, downy, woolly surface or superficies, of cloth, plant, or other substance.

Napery is applied to the substance itself, (sc. linen,) having such surface.

And the thyrd came and sayd: Lord beholde here thy pounde,
 whiche I haue in a *napkyn*,

Bible, Anno 1551. Luke, ch. xix.

Tel me one thing, quoth he, that ye want. One thing (quoth I?)
 Mary amongst many things that I want, I want *naperie*.
Fox. Martyrs, fol. 995. Dr. Bonner's Declaration against the Bishop of Winchester.

Our innes are also verie well furnished with *naperie*, bedding,
 and tapisserie, especiallie with *naperie*: for beside the linnen vsed

at the tables, which is commonlie washed dailie, (there) is such and so much as belongeth vnto the estate and calling of the ghest.

Holinshed. Description of England, vol. i. ch. xvi. p. 414.

The velvet *nap* which on his wings doth lie.

Spenser. Muirpotmos, p. 339.

Why should this lady, and t'other lady, and the third sweet lady,
 and madam at Mile-end, be daily visited, and your poorer neigh-
 bours with course *napses* neglected.

Beaumont and Fletcher. Wit without Money, act iii. sc. 1.

That brushing, dressing, nor new *naps* can mend.

Id. A Wife for a Month, act ii. sc. 1.

There be also plants, that though they have no prickles, yet they have a kinde of downey or velvet ruse, upon their leaves; as rose-campion, stock-gilly-flowers, colts-foot; which downe or *nap* cometh of a subtil spirit, in a soft or fat substance.

Bacon. Natural History, Cent. vi. sec. 560.

BRUTUS. I heard him sweare

Were he to stand for consull, neuer would he

Appear i' th' market-place, nor on him put

The *naples* vesture of humilitie.

Shakspeare. Coriolanus, fol. 10.

NAPALA, in *Botany*, a genus of the class *Mona-*
delphia, order *Polyandria*, natural order *Malvaceæ*.
 Generic character: calyx bell-shaped, five-cleft, simple;
 corolla, petals five; capsule orbicular, depressed, ten-
 celled, seeds solitary.

A genus allied to *Sida*, containing two species,
 natives of North America.

NAPE, or as Skinner writes it, *nap* of the neck, so
 called (he thinks) from the downy softness of the hair that
 grows upon it: Junius derives from the Greek *νάπη*,
rupes.

She sent an arrow forth with mighty draught,

That in the very dore him over caught,

And, in his *nape* arriving through it thril'd

His greedy throat.

Spenser. Faerie Queene, book vi. can. 7.

As Palamede to scale the bulwarks strove,

In his right eye the fatal arrow drove,

Through all the optic nerves its passage tore,

And issu'd at his *nape* besmeared with gore.

Hoole. Jerusalem Delivered, book xi.

NAPIMOGA, in *Botany*, a genus of the class *Poly-*
andria, order *Trigynia*, natural order *Homalineæ*.
 (Decandolle.) Generic character: calyx, border in a
 double series, twelve to fourteen parted, no glandules at
 the base of the segments; (which distinguishes this genus
 from *Homalium*;) corolla, six or seven petals; stamens
 twenty-one, aggregated in threes; capsule one-celled,
 many seeded.

One species, *N. Guianensis*, a small tree, native of the
 woods in Guiana.

N A P L E S.

Extent, po-
 sition, and
 boundaries.

NAPLES, a Kingdom of Europe, consists of a con-
 siderable portion of Italy, together with the Island of
 Sicily, and the smaller Islands Ischia, Capri, the Ponzian
 group, the group of the Lipari, that of the Ægates, and
 that of the Tremiti. It lies between the North latitudes
 35° 40' and 43°, and East longitudes, 12° 20' and 19°,
 and has an area of 42,714 square British miles, of which
 30,387 are contained in the Continental part, 12,327 in
 the Insular. On every side, except at its North-Western
 frontier, where it joins the State of the Church, it is

bounded by either the Mediterranean or Adriatic Seas,
 and the line of coast measured in all the circuit of the
 Continental part and Sicily, is 1700 miles. Situated in
 the most genial part of the temperate zone, possessing a
 soil the fertility of which is perhaps no where excelled,
 and surrounded by a sea so productive of fish as to
 afford a copious resource to the population, the King-
 dom of Naples, notwithstanding the evils resulting from
 an imbecile and injudicious Government, is one of the
 most densely peopled regions in the World, being among

NAPLES. the European States exceeded in this respect only by the Netherlands, Britain, Lombardy, and France. The census of 1817 stated the population to amount to 6,828,558, of whom 5,114,613 belonged to the Continental part, 1,713,945 to the Insular. From these data it results that the average density of the population all over the realm is 159 to the square British mile; that it is greater on the Continental part, and there amounts to 168 to the square British mile; less in the Insular, and there amounts to 139 in the same space. This population on the main land is principally rural, as, except the Capital, no town has more than 20,000 inhabitants, and in few the number exceeds 10,000. In the Island of Sicily, a large proportion of the people live in the numerous towns disposed along its sea-coast. The nation consists, with little exception, of the race, which, though constituted at various times of heterogeneous materials, has for above twelve centuries been considered uniform under the name of Italians. There are about 4000 Jews, and on the promontory of Gargano and about its base 75,000 Albanians, the descendants of Scanderbeg's followers, whom Ferdinand I. settled there when Mahomet II. subdued their Country. This colony retains its original manners and Language, and adheres to the ritual and spiritual jurisdiction of the Greek Church.

Physical features.

If we consider the Physical aspect of the realm under one view it must be regarded as mountainous. The Apennines having their greatest elevation at the North-Eastern frontier, (where, in Abruzzo, the Sasso d'Italia is 8255 feet high,) spread over the greater part of the main land, leaving on the West, between their base and the coast, the Terra di Lavoro, matchless in beauty and fertility, alluvial or volcanic in character, and with a surface for the most part varied only by gentle eminences; whilst the extensive plain of Puglia expands Eastward between them and the Adriatic. At Venosa, in latitude 41°, they spread out into a table-land, bearing some lofty ridges, one of which, taking an Easterly direction, and becoming less elevated as it proceeds, forms the Peninsula of Otranto, the other continues Southward into Calabria, where some of the summits attain the height of 6000 or 8000 feet. In the Northern part of the Peninsula of Calabria Ultra they sink into a low and broken country, formed, according to Galanti, of deposits swept down from the Apennines, or thrown up by the sea, and altered as well as increased by volcanic eruptions. Geologists regard the ranges of Sicilian mountains as continuations of the Apennines, which, proceeding from Cape Peloro in a South-Western direction, at a short distance inland, divaricate into two ridges, whereof one running Southward terminates at Cape Passaro, the other traverses the whole Island in a Westerly direction, and, after sending off laterally several branches, forms at its extremity the Promontory Boco, Cape St. Vito, and other headlands. *Ætna*, *Vesuvius*, *Somma*, and the volcanic eminences of the *Campi Phlegreæi* must be regarded as independent of the Apennines, as well the ridge of *Voltore*, and *Mount Gargano* in Puglia. All the islands on the Western coast of the main land, with the exception of *Capri*, are admitted to be the productions of subterraneous fires. The greatest height within the realm is that of *Ætna*, amounting to 10,630 feet; and although this elevation is not considered strictly to enter the limits of perpetual congelation, the summit is never quite free from snow. The climate and natural productions are so modified by the difference of lati-

tude, elevation, and aspect, that we must defer their consideration until we treat of the subdivisions of the territory.

Since 1816, Continental Naples constitutes with the Island of Sicily an indivisible realm, the title of which is the "Kingdom of the two Sicilies." It is a limited monarchy, hereditary in a branch of the House of Bourbon. The King has the supreme legislative power with the exception of the prerogative of taxation, which he cannot exercise without the concurrence of the Nation signified through its Representatives, who assemble in two separate Parliaments, that of Continental Naples at the Capital, that of the Island of Sicily at Palermo. Although the assent of these Bodies is requisite for either imposing or increasing any tax, they are strictly excluded from participation in the powers of Government. There are two Councils of State, that of Chancery in which the Chancellor presides, and which, permanently fixed in the Capital, discharges the functions of examining and preparing documents for the cognizance of the King. The other, the Royal Council of State, is ambulatory, attending on the King's person, and assisting him with its advice. The number of its Members must not exceed thirty-six, nor be less than twenty-six. The local offices and dignities of Sicily can be conferred only on the natives of that Island, who are in turn excluded from similar preferments on the Continent. The natives of the Island of Sicily, however, are eligible to all posts in the general Government of the realm, and as its population is one-fourth of that of the whole State, the same proportion of the Members of the Council of Chancery, as well as of the Council of State, is to consist of Sicilians. This proportion is also to be observed in the appointment of the Ministers of the realm, of the great Officers of the Court, and of the Envoys to Foreign Powers. The offices of the sea and land service, and of the King's domestic establishment, may be conferred on all subjects without limitation or distinction. On occasion of the King visiting Sicily, a Viceroy is appointed to reside in Naples, and in case he be a Prince of the Blood, there is joined with him a functionary, whose business it is to hold continual communication with the Ministers in attendance on the King. In the ordinary course of affairs, the King, presiding in Naples, intrusts the management of Sicily to a Viceroy. The distribution of justice in Sicily is totally exempt from the control of the Neapolitan jurisdiction, and appeal in the last resort lies to the Supreme Court of Justice in Sicily. By the Act of Government of 1816, the Feudal system, with all its train of oppressive and mischievous regulations, has been abolished. The King has the prerogative of apportioning the proportion of the contribution to be paid by each of the two great divisions of the realm, with the proviso, however, that the Sicilian quota shall not exceed 1,847,687 ounces, (£924,000,) and that any further sum must be sanctioned by Parliament. The King must conform to the Roman Catholic Faith, which is declared the Religion of the State. The succession is open both to males and females. The heir apparent when a male has the title of Prince of Calabria. The King's title is "King of both the Sicilies and of Jerusalem, Infant of Spain, Duke of Parma, Piacenza, and Castro, Hereditary Grand Prince of Tuscany." The establishment of the Royal Court is numerous and splendid, and the Heir apparent, as well as the other Princes of the blood, have their separate households in a liberal and handsome style. There are four Orders of Knighthood: 1.

NAPLES.

Political organization.

NAPLES. that of St. Ferdinand and Merit founded 1801; 2. that of St. Januarius, founded 1738; 3. the Constantine Order; 4. the Order of both the Sicilies, founded 1808. The revenue of the State is in round numbers £3,000,000, of which the Island of Sicily contributes something less than a third. The military force amounts to 64,000 men, of whom 10,000 are stationed in Sicily. In case the number cannot be filled up by voluntary recruits, recourse is had to conscription, so regulated, that on the Continent from every division of the population containing 2000 souls three conscripts are drawn, and in the Island of Sicily each division of 1000 supplies one. The Ecclesiastical Order probably bears a greater proportion to the population in the Neapolitan dominions than in any other Country. Galanti states the number of the secular Clergy to be 47,232, possessing an income of 3,408,090 ducats, and of the Members of Monastic institutions 42,333, with an income of 5,011,300 ducats. Various eleemosynary institutions have an income of 588,000 ducats. Although the Pope has the patronage of most of the Ecclesiastical dignities, no communication from him can be published in the Neapolitan dominions unless previously examined and sanctioned by the King. This State, notwithstanding its admirable position for engrossing the trade of the Mediterranean, its command of timber for ship-building, and its great extent of coast containing some excellent havens, can scarcely be said to have a navy. Its fleet consists of two ships of the line, five frigates, and eighteen smaller vessels, unable to defend its trade and coasts from the insults and depredations of the Corsairs of Barbary. The commercial shipping consists of 255 vessels large enough to engage in distant voyages, and 3480 small-craft. The realm is divided into the two jurisdictions of *Domini al di qua del Faro*, and *Domini al di là del Faro*. Reserving the consideration of all topics peculiarly appertaining to the *Domini al di là del Faro*, for our account of SICILY, we shall proceed to describe the *Domini al di qua del Faro*, or the Continental portion of the realm.

Domini al di qua del Faro.
Extent and boundaries.

Sea-coast.

Fondi.

This division, bounded on the North-West by the State of the Church, on the North-East by the Adriatic, and in all other parts by the Mediterranean, lies between 37° 44' and 42° 50' North latitude, and 15° 35' and 19° 3' East longitude, is 340 miles long from the Northern extremity of Abruzzo to Cape Rizulo in Calabria, and 140 miles broad from Monopoli on the coast of the Adriatic to the point of Terrone projecting into the Mediterranean. Its superficial extent is 33,000 square British miles. In treating the Physical structure of this singular and magnificent Country, where Nature exhibits her softest and most attractive charms in close and striking contrast with the sublimest and most dreadful exertions of her powers, we shall commence by a survey of the sea-coast, beginning at the North-Western extremity, and proceeding to the North-Eastern point of Abruzzo, a circuit of 1180 miles. In this long range it may be observed, that no harbour occurs capable of affording sure refuge to a fleet of vessels having great draught of water; and as the coast is remarkably broken and indented, this fact must be accounted for principally by the absence of tides, which, as in other parts of the Mediterranean, are scarcely perceptible, seldom rising to above eighteen inches.

At Fondi, situated on the North-Western extremity of the sea-coast, the shore is indented by a shallow lagoon abounding in fish, but the cause of malaria,

which desolates the vicinity. From this low tract the land rises rapidly into the Monte Cecubo, the extremity of which, projecting into the Mediterranean, is the Gaeta of the modern Italians, the *Caieta* of the Romans, to which, according to Virgil, the nurse of Æneas left her name. This mountain, according to Breislak, (*Voyages Physiques*, tom. i. p. 3.) consists of the same calcareous stone as the Apennines, disposed in horizontal strata. The headland of Gaeta is cleft with numerous chasms, varying in width from one to six feet, and extending from the water's edge in a vertical direction to the summit. They were, according to Breislak, produced by the consolidation of the semi-liquid mass which originally formed the eminence. As is usually the case in calcareous formations, the soil is very fertile, and was in ancient times celebrated for its growth of Cæcuban and Formian wines. The calcareous formation continues to the mouth of the River Garigliano, at the Southern bank of which commences the volcanic region.

About forty miles to the South-West of Gaeta, lies the group of the Ponzian Isles, consisting of Ponza, Palmarola, Vendutena, and Santo Stefano. Ponza, (anciently *Pontia*.) the largest, is the production of volcanic action. It is four miles long, of an irregular and elongated form, no where exceeding half a mile in breadth, fertile, well cultivated, and has the advantage of an excellent port, capable of containing fifty sail of merchant vessels, and conveniently situated for affording refuge to shipping plying along the coast Northward from Naples. Its population find considerable resources in an active and productive fishery. It has some Historical celebrity in consequence of having been the place to which Drusus, the son of Germanicus, was banished, and afterwards starved to death by the order of Tiberius. Hither also Caligula banished his sisters after his incestuous violence against them. The small Island of Palmarola, lying to the North of Ponza, and apparently once joined to it, has a circuit of lofty and precipitous rocks, which every where prevent access, except at one narrow landing. It is uninhabited, and regarded as the favourite residence of the Devil by the neighbouring islanders, who are so little inclined to dispute his claim, that from no inducement will they venture to pass the night on its shores. Zannone, of still less dimensions and more difficult access, was once the seat of a small Convent of Benedictines, but is at present uninhabited, as is also Santo Stefano. Vendutena, the *Pandataria* of the Romans, is about five miles in circuit. It is fertile, well watered, and has a small port excavated by art at some unknown period. It was employed by the Roman Emperors as a State prison. Agrippina, the illustrious widow of Germanicus, was confined here, and at an earlier period Postumus Agrippa was put to death here by the machinations of the Empress Livia. Here, also, was perpetrated the murder of the divorced Empress Octavia, the innocent victim of the vindictive jealousy of Poppæa.

The shore of the Campagna Felice to the South of the river Garigliano is low, and consists uniformly of volcanic productions. To the South of the mouth of the Volturno is the Lake of Patria, which received its name from the epitaph placed on its bank over the body of Scipio Africanus, and commencing with the indignant apostrophe *Ingrata Patria*, &c. It is formed by the stagnant water of the Clanio, is about two miles in circumference, of small depth, seldom exceeding three feet, and abounding in excellent fish, which, however, are liable to be destroyed in hot Summers by the vehemence

Lake of Patria.

NAPLES. of the sun's rays. In 1795, so many perished that the weight of their bodies was estimated at 800,000 pounds. The sea here must have retired considerably, as a margin composed of quartzose, sea-sand, and fragments of marine shells extends for about a mile inland. The small Lakes of Licola and Fusaro are situated between Patria and Miseno. The promontory of Miseno forms the Northern headland of the Bay of Naples. It is a high rock of tufa, considered to have been part of the enclosing wall of a volcanic crater, of which Ischia, Procita, and Nisita formed other portions before they had been separated by a supposed irruption of the sea, which, according to this hypothesis, swallowed up the Southern segment. The Island of Procita, separated from Miseno by a channel two miles wide, is five miles in circumference. No longer the dreary and desolate spot described by Juvenal, (*Satire* iii. l. 5.) it is the populous retreat of the luxurious Neapolitans, and, from its picturesque scenery, numerous handsome villas, and rich cultivation, is (according to Breislak) altogether an enchanting scene. These pleasing features are found in a still more remarkable degree in the Island of Ischia, which lies further out at sea.

Miseno.

Procita.

Ischia.

Bay of Naples.

The Bay of Naples, so celebrated for its picturesque scenery, is an inlet sixteen miles in breadth between the promontories Miseno and Campanella; a line at right angles to that joining these headlands, and extending from it to the city of Naples, would be fourteen miles in length. This noble expanse of clear blue water is bounded on the Northern side by Miseno and the volcanic hills, which, with heights varying from 500 to 1000 feet, stretch along the shore to Puzzuli. Eastward it is closed by the superb Capital, behind which rises the black and striking cone of Vesuvius, whilst the Apennines tower in the remote distance. Further on, the shore is formed by the dark and rugged lavas of Torre del Greco. The Southern coast exhibits a series of sublime and lofty precipices, where the branch of the Apennines which divides the Bays of Naples and Sorrento terminates abruptly at the sea. The scene is closed to the South with ample dignity and beauty by the high and picturesque Island of Capri. The proverbial attractions, however, of Baiæ, on the Northern shore of the bay, no longer exist. It is now a dreary and desolate scene, rent by earthquakes, disfigured by volcanic fragments, and instead of its former salubrity, "mephitic vapours (as Swinburne observes) and stagnated waters have converted this favourite seat of health into a den of pestilence, at least during the estival heats." As a station for large vessels it is superior to any other on the shores of the Continental dominions of the King of Naples, but, in consequence of mephitic air is dangerous to the health of the crews. So active even at present are the subterranean fires which have desolated the Northern shores of the Bay of Naples that the sand at the water's edge, although continually washed by the waves, is too hot for the hand to bear.

Bay of Salerno.

Amalfi.

The Bay of Salerno opens to the South of the promontory of Campanella. On its Northern shore occur the small islands named Galli, supposed to have been the Syren's isles of mythic celebrity. The town of Amalfi, constituting during the Middle Ages a small mercantile Republic, is seated at the base of tremendous precipices on this coast. Three circumstances of very distinct and different character have given it celebrity. Here in the XIIth century the Pandects of Justinian are currently said to have been again brought to

light, after they had for centuries been lost to the knowledge of Western Europe: the invention of the mariner's compass is also attributed to one of its citizens; and it was the birth-place of the noted Masaniello. At Salerno a plain commences which, enclosed on one side by the bay, on all others by mountains, extends Southward along the coast for twenty miles to Pesto. Rice is the crop principally cultivated in this plain, and is accompanied as usual by malaria, from which Salerno itself is not exempt. The shore, stretching from the vicinity of Pesto to Reggio, is in general bold and rocky, without however rising into lofty precipices. In the vicinity of Monteleone, a plain extends along the shore, which is fertile, but subject to malaria. Scylla, of so great Poetical and Proverbial celebrity, is a rock situated at the Northern entrance of the Strait of Messina. It is separated by a deep ravine from the mountain which towers high above it. The flat summit of the rock is occupied by a fortress, and the town is singularly built on the craggy inequalities of its sides. Reggio is situated on the Eastern shore of the Southern part of the Strait, where it begins to expand into the Mediterranean. Its situation is most beautiful and salubrious. From Reggio Southward to Spartivento the shore is formed by the precipices in which the Apennines terminate at the sea. These rocks are rugged, wild, devoid of picturesque beauty or sublimity, and incapable of cultivation, which might relieve the dreary prospect. Spartivento is a lofty and steep point of rock, the base of which, when St. Non visited it, was strewn with wrecks. Squillace, the *Navisfragum Scylacæum* of Virgil, is still the terror of navigators, in consequence of its long extent of iron-bound coast on which the sea breaks with awful force, and where, if a vessel strikes, escape is generally impossible in consequence of the steepness of the rocks.

Spartivento.

The shores which enclose the Gulf of Taranto are, from their picturesque scenery, fertility, and genial climate, probably the most delightful tract in the World; and as the Greeks early visited it in their coasting voyages Westward, their colonies soon spread over it civilization and population to a degree scarcely credible, did not the extensive traces still remaining of their labours place the fact beyond doubt. The Lacinian promontory of the Ancients forms the Western headland of the Gulf of Taranto. Of the superb Temple of Juno Lacinia, which formerly conferred celebrity and veneration on this spot, the sole relics are two majestic columns, whence it has received its present name, Capo delle Colonne. The foundation may still be traced, and shows the dimensions to have been 160 feet in front and 500 feet in depth. A close observation still discovers stairs 300 feet high, which gave ascent from the beach to the sacred edifice. Crotona, formerly famed for its power and wealth, its Philosophers and champions, has sunk into a wretched village. By order of Charles V. its last relics were demolished to construct a fortress. Of Sybaris, its rival and victim, *etiam periere ruinæ*. By close investigation an elevation of the ground may be traced, which is supposed to indicate the course of its ramparts, and assigns it a circuit of twelve miles. This site is at the estuary of the river *Sybaris*, the Crati of the present day, which here, of considerable depth and half a mile wide, affords a tolerable road for shipping. The river is subject to violent inundations, which have deposited a thick stratum of sand on the plain. St. Non

Site of Sybaris.

NAPLES. expresses his conviction that the scenery of the mountains overhanging the plain of Sybaris is no where excelled in beauty. The country rises in terraces, each of which may be termed a paradise for fertility, fragrance, and beauty. The soil is overrun with trees bearing naturally the largest and most delicious fruits. "We spent our time (observes this traveller) in walking through groves of orange trees; we ate delicious oranges, citrons mild as a well-mixed lemonade, and observed some of the largest lemons probably any where to be obtained; they were most of them eight inches in diameter, and some still larger." This lovely scene is rendered more striking by contrast with rugged mountains to the North, which rise to so great a height as to retain the snow nearly throughout the year. To the East of this place the rocks, which hitherto have been calcareous, become quartzose, and this formation continues along the shore of the gulf as far as Taranto. The inlet on which Taranto is situated, might by human labour be easily made an excellent haven for shipping of the greatest draught of water, at present it admits only small fishing-boats. Gallipoli, situated to the South on a rocky island joined to the main land by a bridge, has an incommensurable and unsafe haven, capable of great improvement at a moderate expense. Further Southward the low range of hills, extending through the Peninsula of Otranto, terminates at the Capo di Leuca, or Finisterre, forming the South-Eastern headland of the Gulf of Taranto. Otranto has merely an unsafe road for shipping, and the accumulation of sand is daily rendering it shallower. From the hills above this town, the Albanian shore, distant about fifty miles, may be discerned. The shore of Otranto is described by St. Non as exquisitely beautiful, the climate mild and salubrious; the orange and fig-trees, here attaining the size of timber, are loaded with the finest fruit, and resound with the songs of nightingales. The rocks between Taranto and this place are all of calcareous formation. The shore, as we proceed Northward, sinks nearly to the level of the sea, a fact alluded to by Virgil, when speaking of the first view which the Trojans had of the land; he calls it *humilem Italiam*. The port of Brindisi, according to Swinburne, is capable of being easily rendered the best in the Adriatic. The Outer Port, or Road, is of the shape of a triangle, the side of which next to the sea is in a great measure occupied by a group of rocky islets, the site of the fortifications called the Castle of St. Andrea. Opposite these, where the sides of this road converge to form the vertex of the triangle, a narrow opening conducts to the inner port, or actual haven. From this channel of entrance two creeks diverge to the North-West and South-West, so as to embrace a semicircular piece of land, on which the town is built. The Ancients fancied a similitude between these inlets with their smaller creeks and the antlers of a stag, and hence the town received its name, which, in the aboriginal Language of the Country, signified "the head of a deer." This inner port is deep, two miles and a half long, about 1000 feet broad, and on all sides sheltered by hills from the storms of Apulia, or of the Adriatic. In ancient times, the entrance to the Inner Port was rendered more conspicuous by lights burning on the summits of columns, one of which stood on the Northern headland, the other on the Southern. One of these columns is still erect, and in good preservation, the other was thrown down by an earthquake in 1456, and sold to the town of Lecce. This haven, possessing so many advantages, is rendered almost useless in conse-

quence of the shallowness of the entrance, which was in the first instance nearly closed by piles when Julius Cæsar attempted to bar the exit against the fleet of Pompey; and in the Civil wars of the XVth century, some ships, intentionally sunk there with loadings of rubbish, have afforded such a nucleus for the accumulation of sand that it has totally closed the entrance, except during violent inundations. The Inner Port, in consequence, has become a fetid green lake, the malaria from which produced intermittents so fatal, that, in the Autumn of 1775, fifteen hundred of the inhabitants died, and the present number, amounting to 5000, in their haggard and sallow looks, bear sad evidence of the deleterious atmosphere. The Adriatic is in general shallow, a line of fifty fathoms in most places reaches its bottom, which is found to be of calcareous rock, where not covered by the sand formed by the trituration of this stone in the waves. Being a huge trench enclosed by the Apennines on the East, on the West by the Albanian highlands, it is liable to be thrown into furious agitation by sudden and violent gusts descending from those mountains, so that the epithet *improbus*, given it by Horace, is allowed to be still perfectly just. Ofanto, the ancient *Aufidus*, though almost dry during the heats of Summer, is still during Winter as obstreperous as when Horace celebrated its fury. Near its mouth, the field of Cannæ, still kept in remembrance by the popular name *Pezzo di sangue*, or Field of blood, is a dreary and marshy plain, bounded on each side by hills, and suggesting melancholy reflections by its aspect. At Salpi, a long, shallow, and narrow inlet in the low shore, affords so great facilities for manufacturing sea-salt, that enough might probably be obtained from it to supply the demand of the whole human race. At Manfredonia, the shore rises into cliffs and steep headlands, where the ridges of Gargano terminate at the sea, in precipices reaching the heights of from 1000 to 3000 feet. A short tract of low shore, indented by the inlet called Lake Varano, separates Gargano from that part of the Apennines which here stretches to the Adriatic. A rocky shore of no great height, and destitute of sea-ports, extends Northward along Abruzzo to the mouth of the River Tronto, which forms the Northern boundary of the Kingdom. The Tremiti, the *Insulæ Diomedæ* of the Ancients, are a small group of islands, situated about fifteen miles from the coast of Abruzzo, and containing only forty-six inhabitants.

The Apennines extend over the greater part of Abruzzo, where they reach their greatest elevation, the summit of Gran Sasso d'Italia being 8255 feet above the level of the sea. Many points of great height are disposed about the basin, the bottom of which is occupied by the Lake Celano, or, as it is also called, Fucino. As these are covered with snow the greater part of the year, they impart to the climate a severity little to be expected in such a latitude. The mountainous mass, here occupying the central part of the peninsula, sinks on the Western side into the Campanian plain, and Eastward sends off a number of ridges, which, gradually becoming lower, terminate on the shore of the Adriatic, without forming any lofty or prominent headland. The vales between these are often extensive, and generally fertile, having usually in the lowest part the channel of one of those small streams, of which a great number here flow from the Apennines to the Adriatic. Brocchi assigns to Monte Velino, to the North of Lake Fucino, an elevation of 7872 feet. Of other heights in the same vicinity, the

Apennines.

NAPLES. most remarkable are, Monte Corno, Monte Candito, Monte Nivoso Pizzo di Seno, which usually become covered with snow in October, and retain it until May. Further South, the ridge called Matese rises to a great height, forming the crest separating the inclined surface towards the Mediterranean from that towards the Adriatic. The highest points, Monte Capraro and Monte Biserno, are every Winter covered with snow during some months. To the South of these, the breadth of the Apennines increases, and, by means of its principal ridges, forms the three valleys of Benevento, Avellino, and Ofanto, which, from their extent, the evenness of their surfaces, and their elevation, might perhaps be more properly styled Table-lands. Monte Vergine and Monte Serino are considered to be the most elevated points in this part. A ridge running Westward forms the promontory, which, separating the Bay of Naples from that of Salerno, terminates in the Cape of Campanella. The summit of Bolgario, near Salerno, is 3496 feet high. The main chain, proceeding still Southward, terminates in the quartzose precipices, which in many places form the North-Western coast of the Gulf of Taranto. Some of the summits here reach so great heights as to be covered with snow for many months. St. Non, who visited them in the end of May, asserts that the snow which then lay on them continued through the year; but as he does not give this on his own observation, and the statement appears in no other writer, it must be received with caution. The ridge which running in an Easterly direction proceeds towards the peninsula of Otranto, soon sinks so low as almost to form a plain between Brindisi and Taranto; it subsequently acquires greater elevation, but no where in that region rises to any considerable height. The Calabrian ridge, taking its course Southward, also diminishes in height as it proceeds. The most remarkable summits are, Monte Malaspina, Monte Mauro, Monte Isauro, Monte Sila, which last, overgrown with forests, forms a woodland tract of about 200 square miles. There are among these mountains many level and fertile valleys, the most extensive of which is that bearing the name of Cosenza, from the chief town of the district. They terminate Southward at the Capes of Spartivento and Arme, and both on the East and West leave considerable plains between their bases and the sea. The largest is that of Monte Leone, stretching in a Northern direction from the neighbourhood of Reggio to that of St. Eufemia. The nucleus of the Apennines appears to be granite, which breaks forth amidst calcareous formations on the most elevated summits; above this transition limestone occurs. The Apennines, according to Brocchi, (*Conchol. Fossile sub Apennina*, Milan, 2 tom. 4to. 1814,) divide this peninsula into two parts, which differ much in their geological structure. That lying between them and the Adriatic consists of rocks of secondary formation, if we except serpentine appearing in some places; the other, lying between the same range and the Mediterranean, presents for a long space, especially towards the sea-coast, a collection of primitive and transition rocks, accompanied often by secondary. At the base of the Apennines, as well on the Adriatic as on the Mediterranean side, extend several chains of hills, which occupy the space between the principal range and the sea-coast. They are of a later date, and should be called tertiary, to make use of a term employed by such Geologists as divide mountains into those of primary, secondary, and tertiary formation. They should clearly be

referred to a period comparatively recent, as they have been formed either of mud or of sand, containing a great quantity of sea-shells, which not only retain their natural colour, but even the ligaments uniting the valves of their shells. They contain also the skeletons of cetaceous animals, as well as of terrestrial, the natives of the Torrid zone. This tertiary formation, according to Brocchi, reaches an elevation of about 2200 feet above the level of the sea. Such is the chain of *Le Murge*, in the Capitanata, extending parallel to the Apennines. They are covered with an immense number of calcareous stones unconnected, pierced with holes, having the angles rounded off, and presenting various capricious shapes, among which the most frequent is one resembling a horse's head. The great mass of the Apennines consists of a calcareous formation, styled emphatically by Brocchi Stone of the Apennines. (*La Rocca degli Apennini*.) He considers it earlier in its origin than that just described. Its stratification is regular, offering no variety of substance, and totally devoid of any thing attractive for a Geologist. The investigator of Nature, (he observes,) on entering a tract of this sort, traverses a vast extent without meeting any other formation from the base to the summit of the mountain, or without any substance occurring which may amuse or relieve the tedious uniformity. Such is the prevailing formation in Abruzzo, stretching hence through Puglia to the Basilicata and the extremity of Otranto, though it is doubtful whether it extends through Calabria. Its peculiar colours are a dingy white, a pearly grey, or a faint carnation, and sometimes it has a greenish tint. Its fracture is even, but dull and devoid of polish. The fragments have usually a conchoidal form, and are traversed by slender threads, which wind tortuously, like the sutures of a skull. In some places, it contains fetid strata, which when rubbed give out a strong smell of sulphuretted hydrogen. Such occur at Castellamare and Salerno. This rock is sometimes so coloured as to constitute precious marbles. The extensive plain of Puglia Petrosa consists of limestone of the tertiary formation, scantily covered with mould, or in some places merely with fragments of shells. In planting the vines, olive, and carob trees, which are the principal objects of cultivation here, it is found necessary, by blows of hammers and pickaxes, to break down that solid crust, in order that a layer of chalky soil may be formed capable of admitting the roots.

Monte Gargano, forming a promontory in the Adriatic, though separated on all sides from the Apennines, consists, like the greater part of that range, of calcareous formations. The height in some parts amounts to about 4000 feet. The volcanic group, consisting of the mountains of Somma and Vesuvius, is separated from the Apennines by plains; the highest point of Vesuvius has an elevation of 3692 feet above the sea. Somma is a little higher. A fuller account of these mountains is reserved for that part of our notice devoted to the consideration of volcanic phenomena. The summit of Epomeo, in the Island of Ischia, is 2364 feet high.

As the crest of the Apennines forming the line of division for the waters flowing Eastward or Westward, is no where distant from the coast, none of the rivers are large, and most are, during Winter, torrents, shrinking in Summer into rivulets. The Garigliano, the *Liris* of the Ancients, is the most considerable, as its course, commencing near Lake Fucino, is about 100 miles in length, being navigable for about twenty miles, though

and falls into the Mediterranean below Gaeta. Of its diminutive tributaries, it will be sufficient to name the Sacco. The Voltorno, with a less body of water, has a longer course than the Garigliano; it rises in the Apennines, and, after receiving the tributary stream Calore, flows by Capua, and falls into the Mediterranean. Silaro, in the Principato Citeriore, pursues a course of about eighty miles, and falls into the Gulf of Salerno. The Crati, in Calabria Citeriore, rises near Cosenza, waters the extensive plain in which that city is situated, receives the waters of the Sybaris, and, forming a deep estuary of about half a mile wide, falls into the Tarentine Gulf below S. Mauro. Further Eastward, the Acri, the Basiento, and many other small streams, after a short and rapid course, fall into the same gulf. The Ofanto, anciently *Aufidus*, a rivulet in Summer, a formidable torrent on the melting of the mountain snows, falls into the Adriatic above Barletta. In Abruzzo, the Pescara, after a course of about seventy miles, falls into the Adriatic. The Tronto, a small stream, forms the boundary between this Province and the State of the Church.

Celano, the ancient *Fucinus*, is the only considerable Lake in the Neapolitan territories. Its circumference at present is 47 miles; its breadth, in the largest part 10, where narrowest 4; its depth, on an average, 12 feet. Its extent is subject to great variations; fragments of boats and accumulations of shells, on the dry ground above two miles from the present beach, show that the water formerly extended so far, and within the memory of old persons, the water's edge has been nearly two miles within its present limits. The water is perfectly fresh, pure, and wholesome, it abounds with fish, and its surface is sometimes crowded with flocks of water-fowl. All around this lake the country rises into picturesque and grand mountains, some of them amongst the highest of the Apennines. Like other mountainous basins, it is liable to be agitated violently by sudden gusts of wind. The emissary, or drain, excavated, according to the orders of the Emperor Claudius, by the labour of 30,000 men for eleven years, is at present choked up, and the water of the Lake can escape by no other means than infiltration; a very uncertain and insufficient passage, and, as three streams are received by it, extensive and ruinous inundations frequently take place. The Lake of Avernus, about half a mile in length and a third of a mile in breadth, is of the shape nearly of an exact oval. It is situated at the North-Western extremity of the Gulf of Puzzuoli. The basin is universally admitted to have been the crater of a volcano long extinct. It now forms a sublime and pleasing object; the waters of a dark blue colour and 360 fathoms deep, reflect vividly the groves rising along its sloping enclosure, and as it no longer exhales those mephitic vapours formerly said to be fatal to the birds which came within its influence, its surface is enlivened by numerous flocks of water-fowl, and its banks glitter with kingfishers incessantly in motion, searching for the prey which the Lake, abounding in the finest fish, liberally affords them. United to the Lucrine Lake by means of a canal constructed under the direction of Agrippa, it formerly served as a haven to the Roman fleet; but the communication has been obliterated, in consequence of the alterations which volcanic convulsions have produced in

this region. Agnano is a Lake lying about eight miles to the East of Avernus, which it equals in size, but it is far inferior in picturesque beauty, and exhibits rather a soft and agreeable landscape than any bold features of scenery. It will be sufficient merely to enumerate the other Lakes, which in Countries more abounding in water would be regarded only as ponds. They are, in addition to the Lagune, or those situated on the sea-coast, and which have been already mentioned, Lago di Battaglia and Lago Lesina, in the valleys of Gargano; and in the Terra di Otranto, a few plashes, which, formed by the overflowing of torrents in seasons of rain, nearly disappear at the other times of the year. Natural warm and vapour baths, as well as mineral springs, are numerous, as might be expected in a tract so affected by subterraneous fires. The principal are the vapour baths, or Sudatori of S. Germano; the hot baths, called the Pisciarelli, near Monte Nuovo; the warm baths on Monte Massico and Ischia; the mineral springs at Naples, Riardo, and Castellamare; the warm and vapour baths in the Island of Lipari.

The description given by Saussure is in a great measure applicable to the climate of all the Neapolitan territory, except Abruzzo, where the temperature is low for a great part of the year, and the air rough and inclement. In the Southern extremity of Calabria also, the lowness of the latitude, and the exposure to the winds, Sirocco and Libeccio, give the climate and country something of the aspect of Syria, or of the fairest parts of Northern Africa. Saussure observes, "The Winter may be compared to a cool September in the North of Germany. Vegetation is not suspended, and to the South of Fondi the fields are green throughout the Winter, and the orange-trees retain their blossoms. The air is filled with the fragrance of aromatic shrubs growing wild, rosemary, sage, and myrtle. In fine, without having been in this enchanting region, it is impossible to form a conception of the delightful form which Nature bears at Naples during Spring and Winter. But nothing earthly is exempt from imperfection; in proportion as the climate of Naples is delightful through eight months of the year, it is scorching from the end of May to the beginning of October. The sun reaching a height not very far from the zenith, scorches all vegetation with his piercing rays, the unclouded sky denies refreshment to the parched soil, a sultry atmosphere envelopes the brown landscape, and it is vain to expect refreshment from the diurnal sea-breeze, which, having passed over Africa and Sicily, comes loaded with fiery and pernicious exhalations." St. Non describes the Provinces of Otranto and Calabria as exempt in every season from a degree of inclemency which might bear the name of Winter; so early is the maturity of the crops, that he found the inhabitants reaping barley on the 22d of May. In Abruzzo, in consequence of the great height and extent of the mountains, the Winters usually have a severity equal to that endured in the Southern part of the British Isles. Swinburne, who travelled through it at that season, describes the inclemency of the weather as almost intolerable to his sensations. The mean degree of warmth at the city of Naples is $12\frac{1}{2}^{\circ}$ Reaumur, but during the Sirocco the mercury sometimes rises to 33° of the same scale: in December 1808, it sunk to 7° below zero, but the degree of cold is rarely so great as to cause it to fall more than 3° below zero on that scale. Montesquieu might have drawn from Abruzzo an instance in favour

Climate.

NAPLES. of his doctrine, that the Physical circumstances of the soil exert a decided and paramount influence over the people inhabiting it, since the rugged mountains and bracing air of that region may be considered to have conferred on the *Marsi* the hardy and warlike character which rendered them formidable enemies to Rome at the period of its greatest vigour, and in the Social war compelled that haughty Republic to confer on them an equality of political rights. The range of Apennines intercepting the vapours swept from the Mediterranean by the Westerly winds, causes rain falling on the Adriatic side to be less than that on the other, in the proportion of about two to three; a deficiency, the effects of which are observable in the aridity and comparative inferiority of fertility in Puglia. A mean of observations taken for ten years gives twenty-nine inches as the average fall of rain at the Capital. It may be observed, that this quantity exceeds by above four inches the average fall of rain in Dublin, the climate of which is usually regarded one of the moistest in the world. (Newenham, *Moral and Political Circumstances of Ireland*, p. 42.) Mephitic exhalations from the Solfaterra and other volcanic orifices render the Bay of Puzzuoli very unwholesome. The low shore extending Southward of Salerno, and that to the South of St. Eufemia, suffers from the prevalence of intermittents and similar forms of disease produced by marsh miasma, and this scourge also afflicts considerable tracts on the coast of the Tarentine Gulf, where in ancient times health and population prevailed. Many places on the shore of the Adriatic, especially Brindisi and the vicinity of the inlet of Salpi, have been nearly depopulated by endemic diseases resulting from malaria.

Volcanic
phenomena

With respect to the extent of the traces of volcanic action there is much variety of evidence and opinion. Many consider the extremity of Calabria to have been thrown up from the sea by the force of subterraneous fires, and St. Non mentions that tufa often occurs on the coast between Taranto and Brindisi; but Breislak, generally admitted to be a competent judge, limits these operations to the Lipari Islands, and the country extending from the Cape of Campanella to Gaeta, together with the islands dispersed along that coast. Throughout this space he states that the soil consists of ashes and other substances thrown out by volcanoes, and limits the actual occurrence of eruptions, as we may find by referring to his Physical chart of the Campagna Felice, to the following places: a space of about eighty square miles in the mountains to the North of Capua; one of about eighty square miles a little to the North of Felice; two small spaces of about five and two square miles to the South of the same place; the *Campi Phlegrei*, with Ischia and Procida, constituting an extent of about fifty square miles; the circular tract lying round the crater of Vesuvius as its centre, and having an area of about seventy square miles. The volcanic tract to the North of Capua is separated from the limestone ridge of Monte Massico by a valley. The town of Sessa, situated there, has its site on an eminence composed of tufa, which seems to be of no very remote origin, since it covers the remains of an ancient city; for some time ago an accidental excavation brought to light, at a depth many feet below the present surface, a chamber with antique frescos, and the ruins of an amphitheatre. It is singular that there is no record or tradition of an eruption having taken place from any volcano near it. Near the same place the bed of a rivulet, which has washed away some tufa, ex-

VOL. XXV.

poses two subadjacent streams of lava, one of which closely resembles in composition that with which the *Via Appia* is paved. Several other masses of lava occur, either near Sessa or near the neighbouring village of Casale; all of these seem referable to the volcanic mountain Rocca Monfina, and one of them indeed seems to indicate that it flowed at no very distant period. Of the great crater of Rocca Monfina many parts have fallen in, but enough remains to enable the eye of the spectator to fill up the outline. The wall of the crater, if we may judge from the extent of the hills into which it has been broken, must have formed a circumference of nine miles, and its height was probably much greater than that of any of its present remains. The volcanic mountain, situated four miles to the East of the city of Naples, consists of the cone of Vesuvius, together with Monte Somma to the Northward, and separated from the actual volcano by the valley called *Atrio di Cavallo*, the surface of which is covered with streams of lava, and fragments thrown out by various eruptions. Monte Somma is a little higher than the cone; its surface slopes gently to the Northward, but towards Vesuvius is a precipitous rock of lava. Its summit is a sharp ridge extending so as to form part of the circumference of a circle of which Vesuvius is the centre; and this circular crest is evidently part of a crater, around the central aperture of which the present volcanic cone has been accumulated in successive eruptions. The other parts of the wall of the crater have been destroyed in some of the convulsions of the mountain; it has been conjectured that they were projected over the country in innumerable fragments during the eruptions which buried Pompeii and Herculaneum. The cone of Vesuvius is a striking object from the bold elevation of its sides, and the gloomy aspect of the black ashes which cover it. The ascent is very difficult from the steepness of the surface, and its coat of deep and yielding ashes. The lower parts of these mountains are very fertile. Although the ashes which are showered on the country by each eruption immediately harden into a substance as tenacious as mortar, this quickly decomposes, and forms a fruitful vegetable mould peculiarly favourable to the growth of the vine, which here produces the highly prized *Lagime* and other wines, the most esteemed products of the Italian vintage.

The tract which, lying due West of Naples, is known now, as in ancient times, by the name of *Campi Phlegrei*, contains at present no active volcano, although exhibiting many symptoms of slow combustion proceeding below the soil. At the Lake Agnano some small remains of subterraneous fires serve to heat vapour baths, of which the Neapolitans make much use for the purpose of carrying off diseases by means of perspiration. Near this place, called the Sudatorio di San Germano, are the ruins of magnificent ancient baths. Close to the spot is the Grotto del Cane, where the mephitic air which exhales from many parts of the surface in this region, being permanent and more concentrated than elsewhere, has attracted a large share of the attention both of the scientific and vulgar. The cavern is ten feet long, and four wide, and appears to have been an excavation formed in digging for puzzuolan earth. The exhalation, which the results of numerous experiments of Breislak ascertain to consist of carbonic-acid gas mixed with azote and atmospheric air, rises to the height of about eight inches, and as the ground slopes downward towards the mouth of the cave, the gases, being heavier

NAPLES. than the atmospheric air, flow away by that channel. Gunpowder was found to explode and phosphorus to burn in this exhalation, but it is destructive to animal life, so that if a dog, (for on this creature the experiment is usually made,) or any other animal, have the respiratory organs subjected to its influence, asphyxia results, and proves fatal, unless the subject of the experiment be immediately removed to a purer air. It is usual to expedite the recovery of the animal by plunging it into the water of the adjacent lake. The animal cannot endure with impunity a frequent repetition of the experiment, since after it has been treated in this way above a dozen times it becomes vertiginous, insensible, and ultimately dies convulsed. The Abbé Nollet had the courage to make upon himself an experiment of the effects of the exhalation. He found from a single inspiration that it produced a sense of suffocation accompanied by irritation in the nose and throat, so that he was seized with a fit of coughing and sneezing. Immediately withdrawing himself from the influence of the exhalation he did not find that any evil consequences resulted either to his respiratory or nervous system.

Astruni. Opposite to the Grotto del Cane rises the mountain of Astruni, which retains the conical shape, and every mark of volcanic origin. This volcano has been converted into a Royal Park by means of a wall, which, six miles in circumference, surrounds the crater. The sides of the crater are composed of tufa, strata of loose pumice, and fragments of lava, exactly resembling the strata of Vesuvius. There is no entrance into it except one made by art. Two lakes, situated in a small plain at the bottom of it, supply water to the deer and wild swine with which it is abundantly stocked. During Summer the reverberation of the sun's rays, and stagnation of air in this cavity, produces a degree of heat insupportable to the human constitution. Between Astruni and the sea is the Solfaterra, the remnant of a volcano, which not only retains its cone and crater, but also some degree of its heat. In the plain within the crater smoke issues from many places, and by means of tiles heaped over the crevices the inhabitants collect a small quantity of sal ammoniac. The hollow sound produced by throwing a heavy stone on the plain of the crater, seems to indicate that it is supported by a sort of natural vault, under which there is probably a pool of boiling water, as a moist vapour rises profusely from the surface of the ground. On the outside, and at the foot of the cone of the Solfaterra, water rushes out of the rocks at the temperature of boiling heat. This fountain, which bears the name of Pisciarelli, and is impregnated with alum and sulphur, is in great repute among the Neapolitans for the cure of cutaneous diseases. The ear when brought near the rock whence the water flows perceives a horrid boiling noise, which seems to proceed from the huge caldron which may be supposed under the plain of Solfaterra. On the other side of Solfaterra is a rock which formerly extended to the sea till part of it was cut away in forming a road. This was undoubtedly lava which ran from Solfaterra, when it was an active volcano. Under this rock of lava, which is more than seventy feet thick, is a stratum of pumice and ashes. The Monte Nuovo, or New mountain, being of very recent origin, has retained its conical shape entire, and hitherto has produced scarcely any vegetation. This mountain is 1000 feet high, and has a crater of a regularly conical shape, and so deep that its bottom is nearly at the level of the sea. Of the wonderful convulsion of

NAPLES. Nature which threw up this prodigious mass we have two accounts, one by Falconi, 1638, the other by Giacomini, 1639. On the night of the 29th of September, 1638, a subterranean fire found vent on the Southern side of Monte Barbaro, and threw up so great a quantity of ashes and pumice-stones that Naples and the surrounding country were covered to the thickness of some inches with these substances. This shower was so fatal to animal life, that the ground was strewn with great numbers of birds which perished, and the sea, either from the same cause, or from some submarine disengagement of deleterious exhalations, was covered with fish floating lifeless. The eruption continued to increase in violence for four days, during which the thick smoke and dangerous explosions prevented a close observation of what was going forward. When the paroxysm had in some degree abated, the astonished neighbourhood discovered that a mountain had been formed of the circumference of above three miles. Three days afterwards a number of people who ascended the new mountain to explore its appearance, paid dearly for their curiosity, as twenty-four of them were destroyed by a sudden explosion. Monte Barbaro is an extinct volcano adjoining to Monte Nuovo, which it greatly exceeds in dimensions. At the bottom of its crater a circular plain extends, with a circumference of four miles. An artificial entrance on the Eastern side gives access to this enclosure, the soil of which still possessing amazing fertility is supposed to have produced the famed Falernian of the Ancients.

The *Domini al di qua di Faro*, consisting formerly of the four great districts, Campagna, Puglia, Abruzzo, and Calabria, is at present divided into the following fourteen Provinces, the extent and population of which are stated according to the safest approximation which existing means of information admit.

	Extent in British miles.	Population.	Chief Towns.	Population.

Second Province of Calabria				
Ulteriore.....			Reggio.....	7,200

The Campagna Felice is bounded on the North by the second Province of Abruzzo Ulteriore, and by Molise, on the East by Principato Ulteriore, on the South-East by Principato Citeriore, on the South and South-West by the Mediterranean Sea, on the West by the dominions of the Pope. Its soil consists entirely of lavas, and ashes thrown out by volcanoes, of which it contains all that exist in the Continental part of the Neapolitan dominions, as both Vesuvius and the less active fires of the *Campi Phlegreæi*, are situated within its limits. These volcanic substances in general form a mould of almost incredible fertility, and as there is sufficient water for the purposes of irrigation, the produce of the soil is wonderfully rich, abundant, and

NAPLES. varied. This productiveness, as well as the vicinity of the Capital, renders the population very dense, so that after deducting 330,000, the number of persons in the city of Naples, we find that there are on an average 388 to each square British mile. The Northern and Eastern parts are hilly, as ridges from the Apennines overspread them, and Monte Cecubo, having a moderate elevation, rises from the plain in the vicinity of Fondi. Vesuvius and Monte Somma are the only mountains of the Southern part, since the eminences of the *Campi Phlegreæi* cannot be regarded as such. To the South of the city of Naples the surface continually ascends towards that branch of the Apennines, which forming the division between the Gulfs of Naples and Salerno, terminates in the Cape of Campanella. The staple produce of the Province is corn, of which the sorts principally cultivated are wheat and maize. The wheat produced is some of the finest in the World, and so abundant, that the return is generally twelve-fold, in some instances twenty-fold the seed; yet the produce is insufficient for the enormous demand of the Capital, the numerous population of which subsists principally on bread or macaroni, made of the finest wheaten flour, so that the consumption amounts annually to 400,000 quarters. The peasantry of the Country live for the most part on maize, of which there are two successive crops in August and September; in very fertile soils and favourable situations a third is sometimes drawn from the same ground in October. After the corn crop, the vintage is considered the most important product. The best wines are produced on vines trained on stakes, as those disposed in festoons hanging from the poplars and elms, which generally enclose the fields, produce an inferior grape in consequence of the height to which the sap must ascend, and the deteriorating effect of the shade. The choicest wines are the *Lagrima* and the *Vino Greco*, both the growth of Vesuvius. Monte Cecubo, the Cæcubus of the Roman topers, retains its ancient fame, as its wine is esteemed next after that of Vesuvius. The vintage of Puzzuoli, Procida, and Ischia gives a luscious wine, most of which is exported, being found to improve by a sea-voyage. The produce of olive-groves is considerable, but might be far more so, as many ranges of hills, which present excellent sites for such plantations, are left unoccupied by any useful growth. Much silk is produced; that of the hills about the city of Naples is most valued, but all is regarded of excellent quality, and bears a high price. According to the system of management adopted here, the silk is gathered at three several times of the year. Figs, chestnuts, and *agrume* (as the species of oranges, citrons, limes, and lemons are here denominated) are produced in great abundance and perfection. There is in general a scarcity of wood, so that the Capital is supplied with fuel principally from the lopping of hedge-rows on the farms. Black cattle are numerous, as the family of every peasant has a cow. Buffalos occur in considerable numbers, and, in addition to their utility for draught, afford milk, which is converted into cheese, bearing the name *Provole*, and in much demand. Of the 38 towns and 466 villages within the limits of this Province, none except the Capital is remarkable either for size, beauty, or opulence.

City of
Naples.

NAPLES, the Capital of the Province and of the Kingdom, though ranking the fourth among European cities in respect of population, is by no means of corresponding extent, as the houses are closely built, and

seven, or, in many instances, eight stories high; the inhabitants, except those in opulent circumstances, are content with incommodious lodgings, and perhaps 40,000 individuals, chiefly Lazzaroni, spend their lives entirely in the open air. These circumstances account for 330,000 persons being crowded within the circumference of this city, which stretches along the shore for the distance of two miles and half, with a breadth on an average of a mile and a quarter. In ancient times it bore the name of *Neapolis*, and, although less generally, that of *Parthenope*, according to local tradition, a Nymph who frequented this spot, and on her death was buried here. It bore the characteristic epithets *soft* and *idle*, (*mollis, otiosa*), from its delicious though enervating climate, and the indolence of its inhabitants. Its ground-plot rises gently from the bay, which rolls its clear waves before it, and is diversified by the bold and lofty outlines of the Islands of Ischia and Capri. The Neapolitans thoroughly appreciate the beauty of the scene, which in their figurative style they term a fragment fallen from Heaven, and they have an emphatic proverb, *Vedi Napoli e poi muori*, "see Naples and then die." All classes of people spend much of their time in the open air, and as the Neapolitans speak incessantly and very loudly, the noise from this cause, as well as from the rolling of innumerable one-horse carriages, is tremendous, and may be heard above a mile from the town, while in the streets it at first almost deafens and stuns a stranger. The haven is crowded with various craft, and the pier or *Molo*, which protects it from the violence of the waves, is continually thronged with people brought thither by the avocations of their business, or enjoying the sea-breezes, and amusing themselves with the narratives of Improvisatori, the rough music of itinerant minstrels, and the wonders set forth by jugglers, who make this place their favourite resort. The principal street is the Strada di Toledo, 1300 paces long, and during the busy time of the day thronged like a market. The Strada Chiaja extends along the shore for 2000 paces, and contains a number of splendid mansions as well as the Villa Reale, a Royal pleasure ground. With the exception of these, however, and the Strada Sta. Lucia, and Strada Carbone, the streets are in general narrow, crooked, and disfigured by irregularity, and the intermixture of meanly and ill-built houses; they are regularly and well paved with lava, and have large and skilfully constructed sewers, which convey all filth to the sea. The houses in general are massively built of tufa. The public architecture is censured as gaudy and costly without impressiveness, and the eye of taste is seldom gratified by the occurrence of any striking building of antiquity. The principal place of worship is the *Domo* or Cathedral of St. Januarius, decorated with a hundred and ten pillars of marble and granite, and a profusion of costly workmanship. The relics which bear the name of the Saint lie in a Chapel beneath the Cathedral: a splendid shrine or sacristy, adorned with four altar-pieces by Dominichino, contains the head and two phials asserted to hold the blood of the martyr, and the fruitful source of the superstition and fanaticism of the Neapolitans, and the ridicule of strangers. Naples, besides the *Domo*, contains 122 Churches, 130 Chapels, and 149 Convents. There are seven Theatres well supported and frequented. Musical assemblies, religious pageants, innumerable and various public amusements afford never-ending pastime to a populace which, content with very sparing means of livelihood, require an incessant

NAPLES. round of entertainment. The Royal Palace is in the centre of the town, and communicates by a covered way with the Castello Nuovo, a fortress of great size and strength commanding the haven, and intended to protect the city from an attack by sea. The city is further protected by the Castello dell' Uovo, (so named from its oval shape,) built on a rock in the sea, but communicating with the land by means of a mole. The Castle of St. Elmo, constructed on an eminence to the North-West of the city, commands every quarter, and is a necessary instrument in the government of a place where the excitability, poverty, numbers, and gregarious habits of the populace render them prone to revolt. This fortress, built by the order of Charles V., has, in consequence of its lofty walls and huge fosses excavated in the rock, a gloomy air, strikingly contrasted with the smiling aspect of the rest of the scenery.

The CATACOMBS of Naples have already been sufficiently described.

Character
of the Nea-
politans.

The air and appearance of the Neapolitans are generally represented as different from those of other Europeans, and suggesting an Oriental character. Beauty is not uncommon in the male sex, it occurs more rarely in the female, who arrive precociously both at maturity and decay. They, however, long retain the brilliancy of their dark and lively eyes. The labouring classes, especially the fishermen, are large and robust. Those whose circumstances allow them to indulge in indolence are even when young inclined to corpulency; and in no part of Europe does there occur so large a proportion of individuals disfigured by excessive fatness and prominent abdomens. Many of the Nobility enjoy large incomes, and affect great splendour in their dresses, equipages, and houses. The middle class, consisting for the most of those engaged in professions, or trading people in easy circumstances, are described as estimable in their public and domestic capacities, but the slaves of formal, ceremonious, and ill-judged politeness. Noon is the most tranquil time of the twenty-four hours in Naples, as the inhabitants are then enjoying their *siesta*, or daily slumber. As evening draws on, the streets become thronged in such a manner, that the busiest parts of Paris, or London, will, in this respect, bear no comparison with them. At such an hour, the stranger who, for the first time, enters the Strada di Toledo, or the Quays, is inclined to apprehend that there is some popular commotion. The space is thronged with a confused medley of human beings, of every class, condition, sex, and age; soldiers, priests, monks, women, and children, mechanics, fishermen, itinerant traders, servants innumerable in gaudy liveries of all colours, paupers ragged and half naked, conversing in a screaming tone and with the most violent gesticulations. In the midst of this crowd, apparently impenetrable, some hundreds of vehicles hold their rapid course without injuring any one. As night sets in, dealers in provisions take their stands at portable shops ornamented with drapery, and retail wine, macaroni, cakes of maize, fried fish, fruit, lemonade, and iced water, while the Nobles resort in numbers to the Theatres or Gambling-houses. It is calculated that Naples consumes annually, corn 400,000 quarters; oil 2,000,000 gallons; cheese 22,000 cwt.; fish 37,000 cwt.; salted provisions 22,000 cwt.; ice 25,000 cwt.; salt 80,000 bushels; wines 990,000 gallons; oxen 21,800; sheep and lambs 160,000; hogs 55,000; kids 80,000; chickens and pigeons 16,000,000; eggs 20,000,000; melons 300,000.

The delightful situation of the Western suburb of

Naples has caused it to receive the name of Pausilippo, **NAPLES.** from Greek words (*παύσις λυπης*) nearly corresponding to *sans souci*. At the outlet of this suburb is a small Pausilippo. quadrangular vaulted building much ruined, which tradition represents to be Virgil's Tomb; and, notwithstanding the unsubstantial objections of Addison, and the doubts of Swinburne, the best informed inquirers see no reason to dissent from the popular opinion. Near to the Tomb is the opening of the Grotto of Pausilippo, or tunnel, (as we should call it,) which here pierces the rocky hill, and affords a subterraneous road, perfectly straight, but ascending to the country about Puzzuoli. It is excavated in the tufa, of which the hill consists, and has the shape of an arch above. Light and air are afforded by means of openings in the roof, which in some places is 89 feet high, and no where lower than 24. Its length is exactly 2414 feet, its breadth 22. The dust, gloom, damp, and danger from the passage of numerous carriages and beasts of burthen render it a disagreeable place. There is no certain information as to the first constructors of this passage, but we learn from classical writers, that it existed in the Ist century of the Christian Era, although practicable only for pedestrians. Alfonso I. made it passable for carriages, and it has since, at various times, been enlarged and rendered more commodious.

The Palace of Caserta is situated at the foot of the Apennines, sixteen miles to the North-East of the Capital, and surpasses in magnificence most of the Royal residences of Europe. Swinburne observes, that "the vast dimensions of its apartments, the bold span of their ceilings, the excellence and beauty of the materials employed in building and decorating it, and the strength of the masonry, claim the admiration of all beholders, who must confess it is a dwelling spacious and grand enough to have lodged the ancient masters of the Roman World." The two principal fronts are 787 feet in length, and contain five stories of 37 windows each. The two other sides are 616 feet long, and consist also of five stories, in each of which are 27 windows. The interior is divided into four courts, and in the centre of the Palace is a superb staircase crowned by a circular hall which affords communication to every set of apartments. The richest marbles are employed throughout the building in great profusion. The Theatre is a master-piece of art, antique columns of alabaster support the roof and divide the house into forty-two boxes richly decorated; all parts of the plan harmonize and produce a concentrated and magnificent effect.

The Palace of Portici, situated on the sea-shore, five miles to the South-East of Naples, is spacious and commodious. It is built close to the site of HERCULANEUM, and formerly contained an invaluable collection of antiquities dug out of the ruins of the town, but the principal part of these relics have been judiciously removed to the Bourbon Museum in the Capital.

The Principato Citeriore, bounded on the North by the Principato Ulteriore, North-East and East by Basilicata, South and South-West by the Mediterranean Sea, North-West by Campagna Felice, is a mountainous tract, so that, properly speaking, there is but one plain extending along the sea-coast from Salerno to Agropoli. The numerous and extensive valleys are very fertile, the scenery is celebrated for its beauty, and the Province is altogether one of the finest in the Kingdom. A great number of olive-trees grow naturally, and their produce, which might form an extensive and lucrative

NAPLES. branch of commerce, is managed so rudely that the fruit is never taken from the branches, but swept from the ground on which it is allowed to fall. Much wine is produced, and manna and dried fruits form a considerable article of export. The staple produce, however, is silk, of which the annual amount is estimated at 52,000 pounds weight. The sea washing its shore abounds with fish, especially the tunny, of which the quantity taken is very great. The nets, by means of cables fastened to anchors, are arranged so as to enclose a large space, and the entrance is left unobstructed in that direction towards which the experience of the fishermen leads them to conclude that the fish will approach. A man posted on an elevated rock gives the signal as soon as the fish have entered, and the opening is then closed, and the prey secured. The muzzle is the part most relished by epicures, the belly also, when salted, is considered a great delicacy. From the beginning of May to the end of October it is eaten fresh, and used salted during the rest of the year.

Tunny fishery.

Salerno.

Salerno, the Capital of the Province, is built on the shore of the bay of the same name, and from the water's edge rises in terraces to the mount on which the Castle stands. The town is enclosed by walls which, although of great antiquity, are still in a state of considerable repair. The streets are narrow and crooked, the houses high and gloomy. It is the See of an Archbishop, and the Cathedral, dedicated to St. Matthew the Evangelist, is a large pile in the Gothic style, irregular and rather barbarous, but very splendid. The columns of the interior are of various precious marbles, the choir is inlaid with square and oval slabs of verde antico, porphyry, and serpentine, and the altar, covered with abundance of rich and dazzling ornaments, has on each side beautiful white and green marble columns. In a subterranean Chapel, a silver shrine contains relics which are regarded as those of the tutelary Saint. Pope Gregory VII. is buried here, having died in this town in 1085 from vexation, in consequence of the failure of his ambitious projects, and his detention in captivity by order of Robert Guiscard. Salerno was renowned in the Middle Ages for its Medical University founded in the beginning of the IXth century. That singular collection of aphorisms which is known by the name *Schola Salernitana*, and contains precepts for the preservation and restoration of health, expressed in Leonine verse, was composed in 1100, and dedicated to Robert Duke of Normandy, who had visited the place to be treated for a wound received in Palestine.

Nucera.

Nucera exceeds Salerno in size as well as population, which amounts to 16,000 persons. There is abundance of water for the purposes of irrigation, and the soil is very fertile, affording three crops in the year. The rents consequently are very high, amounting to £4 per acre; some very valuable lands are let at £5 per acre. The produce is generally fruit, maize, and garden esculents. The people are of a quarrelsome and dangerous disposition, so that above forty homicides have occurred in the course of one year.

Pesto.

Pesto lies on the sea-shore about thirty miles to the South-East of Salerno, and forms by its majestic ruins a land-mark, visible in most parts of the gulf. It was founded by the Træzenians, who gave it the name of *Listilis*, and subsequently enlarged and improved by the Sybarites when it received the name of *Posidonia*. It became a Roman colony 272 B. C., and then was called *Pæstum*. Its situation is delightful, and was salu-

brious so long as it continued in the hands of those who had industry and skill to drain the swamps which at present cause malaria. The Pestan roses, the *Biferi rosaria Pæsti*, bloom as in the time of Virgil; that which now shoots up among the ruins is of the small single damask kind with a very high perfume, and flowers both in Spring and Autumn. The walls of Pæstum, three miles in circuit, are so well preserved as in many places to be twenty feet high. They are built of large masses of travertino laid together without any cement. The relics of its Temples, presenting some of the noblest and best preserved monuments of antiquity, consist principally of three buildings having their fronts arranged in the same line. The middle Temple is the principal; it is 182 feet long, and 74 broad; the columns, of which there are 6 in front, and 14 along each side, have a height of about 30 feet, and a diameter of 6. They are fluted and placed at distances not exceeding a diameter and a half, and this proximity, combined with their simple style and massive proportions, produces an impression of grandeur and solemnity. This structure was of the kind called hypæthral, having its interior uncovered and exposed to the air. The two other Temples are of inferior dimensions, and less simple architecture. That on the Western side has 6 columns in front, and 13 along each side, it is 98 feet long, and 45 broad. That on the Eastern side is 162 feet long, and 70 in breadth. The principal Temple bears evidence of the earliest origin in the greater simplicity of its architecture, which, as well as that of the others, is in the Doric Order. The stone of which they were built is a very durable travertino, but so rough that it had been found expedient to overlay its surface with a coat of plaster. Pesto, one of the first towns which in this part of Italy embraced Christianity, was sacked by the Saracens in the IXth century; its ruin was accelerated by the depredations of Robert Guiscard in the XIth, and the inhabitants, without spirit or means to maintain the works destined for conveying off the stagnant waters of the small river which flows through the plain, were, by malaria, compelled to remove. There are at present, within the walls, a few huts inhabited by peasants employed for the management of herds of buf-falos, the only sort of farming at present practised here.

The Principato Ulteriore is an inland Province bounded on the North by Molise and the Capitanata, East by Basilicata, South by the Principato Citeriore, West by the Campagna Felice. It contains within its territory the small Dukedom of Benevento belonging to the Papal See, in consequence of a grant made in 1054 by the Emperor Henry II. The Apennines, or their branches, extend over the whole Province, the most level and fertile tracts of which consist of extensive valleys and table lands based on the mountains, here lower than in almost any other part. The climate, in consequence of this elevation, is colder than on the sea-coast, and frosts occur during Winter, without, however, such a degree of severity as to cover the streams with ice. There are extensive woods, and in the neighbourhood of Avellino the hazel flourishes uncommonly, and produces by the sale of its nuts £12,000 annually. Wine is an important object of the cultivator's care, and silk, though not a staple article, is produced to the amount of 20,000 pounds annually. The soil is for the most part fertile, least so towards the South, where it generally consists of a cold, heavy, and stiff clay. Barley and wheat are produced in considerable quantities, as well as hemp, flax, and various herbs for the dyer's use. Maize, however, is the

NAPLES.

Principato Ulteriore.

NAPLES. principal corn crop, and with pulse generally forms the diet of the peasantry. The live stock is neither abundant nor valuable; sheep, which are the principal, amount to about 120,000. They are generally *transhumantes*, or migratory, according to the season, like the merinos of Spain. Under this system, introduced by Alphonso I. in the XVth century, the King supplies the sheep of the mountain farms with pasture in the plains of Apulia during seven Winter months. The Royal pastures, known by the name Tavoliere, extend sixty miles in length, thirty in breadth, and are divided into forty-three lots, capable, altogether, of feeding 1,200,000 sheep. The sum paid for this privilege by the farmers occupying the mountainous districts, is £2. 10s. for every hundred sheep. A road called the Trattura, sixty paces wide, is kept unobstructed for the passage of the flocks to the Royal pastures at the approach of Winter, and for their return in Spring to the respective farms in the more elevated regions. Herbage, folds, shelter, and protection are supplied at the expense of the Crown during these migrations. The system is under the management of a Board established at Foggia, where alone the shepherds are permitted to sell the produce of their flocks at a Fair held under the inspection and control of officers of the Crown. The number of sheep at present *transhumantes*, is estimated at about 1,100,000, the net revenue resulting to the Crown is about £80,000 annually. About four miles from Frigento is the Moffetta, generally supposed to be the *Amsancti Vallis*, through which Virgil describes Alecto as descending to the infernal regions. It is situated at the bottom of a bare and arid dell, and is an oval pool of muddy, ash-coloured water about fifty feet in diameter. The surface boils up with great force at irregular intervals, and the bursts are always preceded by a hissing noise. Each jet of water rises to the height of five or six feet, and is surrounded by a temporary vortex. A large body of sulphureous vapour is continually thrown out with a hissing noise, and is deposited in yellow incrustations on the steep banks of the pool. The principal mountain in the Province is Monte Vergine, which towers over the town of Avellino. This town, the Capital of the Province, and See of a Bishop who has an income of £1200, extends for a mile along the declivity of a hill, and has many good houses arranged in crooked and irregular streets. The principal resources of the population result from the town being situated on the great road from the Capital to the Eastern part of the Kingdom. It has also a considerable manufacture of woollen cloths. The women attract the notice of strangers by their remarkable beauty; they observe a practice of dyeing their hair with a decoction of wood-ashes which makes it of a flaxen yellow of many different tints in different parts of the same head. This is supposed to be the *flava cæsaries* celebrated by the Roman writers, and the practice is regarded as one of the traces of ancient manners.

Molise.

Molise is bounded on the North-West by Abruzzo Citeriore, North-East by the Capitanata, South-East by Principato Ulteriore, South-West by the Campagna Felice, and West by the Second Province of Abruzzo Ulteriore. It is a mountainous tract, being overspread by the Apennines or their branches. Its highest mountain is Matese, which separates it from the Campagna Felice, and reaches to such a height as to retain snow in the chasms of the summits throughout the whole year. The South-Eastern part of the Province is an extensive val-

ley which inclines towards the Adriatic. The staple produce is corn, of which the quantity grown is very considerable; as the harvests of the Campagna Felice are inadequate to satisfy the great demand of the markets of the Capital, the deficiency is met principally from the crops of this Province. Much attention is paid to the management of bees, and swine are fed in great numbers, and their flesh salted for the markets of the Capital. Its flocks are computed to contain 150,000 sheep, most of which are *transhumantes*. Its provincial name of *Sannio* has remained since the remote period when it formed the principal territory of the *Samnites*. Campo Basso, its chief town, is a place of no importance, and the population derive their support from the traders frequenting the corn-market.

The Second Province of Abruzzo Ulteriore is bounded on the West and North by the Papal territories, North-East by the First Province of Abruzzo Ulteriore, South-West by Abruzzo Citeriore, and Molise, South by the Campagna Felice. The Apennines occupy the whole Province, and, round the Lake of Celano or Fucino, rise into summits covered with perpetual snow. The most valuable natural product is timber, as luxuriant forests cover the surfaces of many of the mountains. The Winters are as severe as in the South of Britain, and the heat in Summer so moderate that grapes imperfectly ripen, and in making wine it is found necessary to boil the must for the purpose of giving it such a degree of strength as may dispose it to ferment. Olives arrive at maturity only in a few low and sheltered valleys. The stock of black cattle is considerable, and the milk of the cows is generally made into cheese esteemed scarcely inferior to that of Parmesan. The principal stock, however, is sheep, which are very numerous, and as they are *transhumantes*, and managed with much care and skill, their wool is highly valued. The inhabitants are considered a hardy and industrious race, and their dialect is regarded as elegant and expressive. Aquila, the chief town, is built in the rich and extensive valley of the same name. The River Pescara flows through it. The streets are large and well built, and the walls surrounding it are in a state of good preservation. It has a Cathedral, and no less than fifty-three other churches. The linen manufacture is pursued with some activity.

The First Province of Abruzzo Ulteriore is the most Northern district of the Kingdom. It is bounded on the North-West by the Papal territory, North-East by the Adriatic, South-East by Abruzzo Citeriore, South-West by the Second Province of Abruzzo Ulteriore. The Western part of the Province is occupied by lofty mountains, the Eastern declines gradually to the shore of the Adriatic, which is low and sandy. The climate in the mountains is cool and often ungenial, on the coast it is warm, and more rainy than is usual on the Eastern coast of Italy. Though the soil is very productive and well watered, this Province is probably the least improved in the Kingdom. Fertile estates of 1000 acres in extent may sometimes be observed untenanted and overgrown with weeds and brushwood. The care of the farmer is principally directed to grazing. The number of sheep is very considerable, and as they are *transhumantes*, the wool, as is usual under that management, is fine and highly valued. The climate is not sufficiently warm for the ripening of *agrumes*, but the vine and olive are cultivated to a considerable extent. The people have the character of a robust and hardy but rough and uncivilized race. Teramo, the chief town, is

Abruzzo
Citeriore.

Abruzzo Citeriore is bounded on the North-East by the Adriatic Sea, South-East by Molise, and in the remaining parts by the other two divisions of Abruzzo. The surface in the interior is generally mountainous, and level towards the coast, where the soil is either of sand or stiff clay, yet for the most part moderately fertile. The attention of the farmer is mainly directed to grazing, and sheep are the principal live stock. As they are *transhumantes* they afford a fine valuable wool, which, in common with the few other articles which this Province supplies to commerce, are conveyed by land to the mart of Foggia, as there is no sea-port along the extent of the coast. Chieti, its chief town, is a Bishop's See, but otherwise a place of little importance.

Capitanata.

The Capitanata, bounded on the North and East by the Adriatic, South by the Province of Bari and Basilicata, West by Molise, is the most extensive Province of the Kingdom. Much the greater part of its territory is a plain, the basis of which is chalk or limestone, covered with a thin stratum of vegetable mould deficient in water, and overrun with wild thyme, giant-fennel, asphodel, and caper shrubs. Mount Gargano forms a promontory projecting far into the Adriatic, and occupies an extent of about 750 square miles, rising in some places to the height of 5000 feet. The climate throughout the plain is very hot and dry, so that there is no Winter, and the Country suffers much from want of rain. The sea-coast is very unhealthy from malaria, especially the part lying immediately to the South of Manfredonia. Gargano is covered with noble forests of deciduous and evergreen timber, the haunts of wolves, wild boars, porcupines, deer, and hares. The level parts are very deficient in wood, and the inhabitants find themselves under the necessity of using brushwood and the dried stems of plants for fuel. Corn, wine, olives, figs, oranges, and licorice are produced in great abundance, and the quantity might be much increased, but that the attention of the landholder is principally directed to the keeping of cattle. The horses are in general well made and active, buffalos are kept, as well for draught as for their milk, converted into the cheese called *provole*, which is highly esteemed, though it has the musky smell of the animal, and is, in consequence, at first disagreeable to the palate. The sheep, which are very numerous, have savoury, high-flavoured flesh, in consequence of the aromatic herbs on which they feed. Their wool, which is very fine, is shorn twice a year. The Capitanata has two principal marts, Foggia and Manfredonia, a sea-port much frequented by traders from Venice, and from the Eastern shores of the Adriatic. Foggia, the chief town, situated in an extensive plain, nearly in the centre of the Province, is neatly built of white stone. It has a handsome Theatre, a well-built Palace, the residence of the Governor, and many excellent houses. There is here a great market for the sale of corn, which is deposited in subterraneous granaries, consisting of pits excavated in the rocky ground on which the town is built, and covered with boards; and so dry is the soil and climate, that such management is sufficient for its preservation. On the 17th of May a great Fair is held for the sale of wool produced in this and the neighbouring Provinces. It is bought principally by French merchants, who export it in the raw state.

Foggia.

To the East of the Capitanata lies the Province of

Bari, bounded on the North by the Adriatic, East by the Province of Otranto, and South by the Basilicata. It is in general a level district, consisting of a calcareous base covered by a thin coat of vegetable mould. There are many swamps on the sea-coast, which is, with little exception, low and sandy. A few mountains of moderate height occur in the Southern part. The only river is the Ofanto. A large quantity of wine, some of excellent quality, is produced in this Province; almonds, figs, oranges, and licorice form considerable articles of commerce. Salt might be made to any given quantity; the present produce amounts annually to 1,800,000 bushels. It is computed that 50,000 cwts. of saltpetre might be made; the actual supply derived from the factories of this article is about 12,000 cwts. annually. The population of the sea-coast have more of the sea-faring spirit than is usual among the Neapolitans, and in their own vessels convey the native produce to Venice and Dalmatia. The Capital of the Province is Bari, built on a low rocky peninsula about a mile in circumference. Its site is pleasant in consequence of the fresh breezes from the sea, and picturesque scenery surrounding it on the land side. It is the See of a Bishop, who has an income of £1200 annually. The Cathedral is noticed for having one of the loftiest steeples in the Kingdom, being 264 feet high. In the Priory of St. Nicholas is a subterraneous chapel, containing a stone coffin filled with a sweet and colourless liquid, apparently a syrup made with sugar. In this fluid a few bones may be observed, alleged to be the relics of St. Nicholas, from which this holy manna, as it is called, is stated to exude miraculously. It is distributed to devotees as an infallible remedy in many disorders. The people of Bari have the reputation of being industrious and intelligent; they drive a brisk trade in the various ports of the Adriatic. The town is still as famous for its fish as when Horace styled it the "fishy *Barium*." Barletta, lying on the sea-coast to the North-West of Bari, is magnificently built, having in remote Ages been frequently the residence of the Arragonian Kings when they visited this part of their dominions. It is thinly peopled, and this circumstance, combined with the splendour of its architecture, suggest the idea of a Capital depopulated by some casualty. In the market-place stands a colossal statue of bronze, seventeen feet high, representing, according to the general opinion, the victorious Emperor Heraclius. The figure is standing, dressed in a military habit; the sculpture is rude and incorrect, and the attitude awkward. This statue had lain for some centuries half buried in the sand on the sea-coast, when, in 1491, it was dug up and placed on the spot which it at present occupies. Barletta contains 18,000 inhabitants.

NAPLES.
Bari.

City of
Bari.

Barletta.

The Province of Otranto, bounded on the West by that of Bari and the Basilicata, is surrounded on all other parts by the sea. It is level in the Northern part, to the South it rises into hills of a moderate height and usually of great picturesque beauty. This range terminates at the Southern point in Cape Leuca. As the peninsula of Otranto is narrow, seldom exceeding twenty-five miles in breadth, it contains scarcely any streams. The Hidro, which flows by Otranto, and the Galesus, of classical fame, which enters the sea near Tarentin, are mere brooks. The stagnation of wintry torrents in rocky hollows forms many small lakes, which are well stocked with fish. The climate is so warm that there is no Winter, but the Summer months are very sultry, and rain at that time seldom occurs. The crops are

Province of
Otranto.

NAPLES. injured not only by want of water, but by vast numbers of locusts, which occasionally infest them. The staple produce of the Province is corn, of which wheat is the most important. Oil of olives is produced in great quantities, and much esteemed for the foreign market as it is found to improve by keeping. The management of bees receives much attention, and the honey is considered the best in Italy. The Tarentine fleeces have not degenerated since the time of the Romans when they were highly prized; the number of sheep is considerable, and those which yield the fine wool are *transhumantes*. Of the population of the Province, about 40,000 individuals are the descendants of Grecian colonists, and retain the Language of their ancestors.

City of
Lecce.

Lecce, the Capital of the Province, is regarded as the second City in the Kingdom. It is generally built in a style of florid architecture, executed in a fine white stone, soft when taken from the quarry, but hardening after a short exposure to the air. Verrio the Painter, who derives his best chance of immortality from Pope's satire, was a native of Lecce, and many of his works decorate its buildings. The population of the town is small in proportion to its numerous and roomy houses, and the habits of the people so secluded, that Craven mentions his difficulty in finding an individual in the streets at noon. The inhabitants, consisting generally of the Nobility of the neighbouring country, with their dependents, are easy in their circumstances and polished in their manners. The common people in this town and in some others of the Province are fond of dog's-flesh, which is said to be consumed in considerable quantities, and even horse-flesh is without

Taranto.

disguise exposed for sale in this part of Italy. Taranto is a diminutive remnant of the great, wealthy, and voluptuous *Tarentum*, the ancient site of which occupied a space of twelve miles in circuit. The present town is built on a tongue of land, washed on its Southern side by the waters of that part of the Mediterranean called the Gulf of Taranto, and on its Northern by the Mare Piccolo or inlet which formed the ancient port, and is about ten miles in length with a mean breadth of about two. This inlet has an entrance 160 yards wide, and crossed by a bridge of seven arches, which joins Taranto to the Northern shore, and supports an aqueduct conveying water to the town from a spring about twelve miles distant. The present town is ill-built and filthy, containing about 16,000 inhabitants, principally supported by fishing. It is still as celebrated for the profusion and excellence of its shell-fish, as when Horace said of it, *Pectinibus patulis jactat se molle Tarentum*. The privilege of taking them is leased by the Crown to various Corporations, who pay 24,000 ducats annually. Swinburne gives a list of ninety-three different sorts to be found here, and mentions that at one entertainment he tasted thirteen varieties all delicious and salubrious. The *Murex* and *Purpura*, which supplied the costly Tarentine dye of the Romans, are still to be met with, but the introduction of cochineal has superseded their use in the Arts. The Mare Piccolo is not at present used as a port, for vessels are excluded by the bridge, and obliged to anchor in a road protected from the sea by the small islands of Sta. Pelagia and St. Andrew. Otranto, which gives name to the Province, is a poor and ill-built place, containing 1600 inhabitants. Its Castle, of romantic celebrity, is a small and rudely constructed fort, intended as a post for watching the movements of Mohammedan Corsairs.

Basilicata.

Basilicata, lying to the South of Capitanata, has a sea-

coast of forty miles along the Western side of the Gulf of Taranto. Its boundary then stretches across the Northern part of the Calabrian Peninsula to the Gulf of Policastro, which bounds it for a distance of about twelve miles. Its Western boundary is formed by the Principato Citeriore and the Principato Ulteriore. With the exception of the sea-coast, where the country is level and fertile, this Province is mountainous, rocky, barren, and regarded as the least favoured by Nature, and the least improved of any part of the Kingdom. The population in general live in a state of great poverty and barbarism. The site of *Metapontum* is marked by a few ruins in the simplest style of the Doric order. They stand near the mouth of the river Basiento, amidst a plain which, instead of the wealth, activity, and cultivation which it exhibited when inhabited by the early Grecian colonists, now presents nothing to the view but a succession of marshes, nearly uninhabited in consequence of malaria. Licorice, which is indigenous in this part of Italy, is one of the principal articles of culture and exportation. Manna is produced in considerable quantities by a species of ash-tree, which receives no culture, unless the term be applicable to the precaution taken by the peasants to cut down all trunks exceeding four inches in diameter, and restrain the growth of the tree to shoots of a bulk inferior to that dimension. Towards the end of July the gatherers of manna make a horizontal incision inclining upwards in the bole of the tree. As the liquor never oozes out on the first day, another cut is given on the second, and then the workman fixes the stalk of a maple-leaf in the upper incision and the end of the leaf in the lower one, so as to form a cup to receive the gum as it exudes from the cut. It is eagerly sought and carried away by various wild animals, which rob these reservoirs. The oppressed peasantry find it a dreadful source of misery, as they are obliged to furnish such a quantity of it as requires a large portion of their time and labour to procure. The price of the drug in the Neapolitan territory is about threepence per ounce. Potenza, the chief town, is a Bishop's See, but contains nothing worth particular notice.

Metapontum.

Production
of manna.

Potenza.

The three Provinces of Calabria occupy the long peninsula forming the most Southern part of the Continental dominions of Naples. The Apennines, extending over the Northern part, rise to a great height. The lower ridges are in general covered with forests of luxuriant oaks and chestnuts, the higher are overgrown with various sorts of firs and pines, and peaks covered with perpetual snows rise above all. These elevated forests, the fastnesses of banditti, have few permanent inhabitants. The peasants of the lower districts drive their cattle to pasture on these mountains during the Summer months, and return to the coasts at the approach of Winter. The North-Western shore of the peninsula is in general low and fertile, but subject to malaria; the South-Eastern is bounded through the greatest part of its length by bold precipices of calcaréous rock, beaten by a boisterous sea. Wherever the elevation of the country does not affect the temperature, the climate approaches to the nature of that between the tropics. There is no Winter, and dry and rainy are the only distinctions of seasons. The frequent occurrence of palm-trees suggests the idea of African scenery, and the aspect of the peasantry indicates that by the influence of climate, by colonization at some remote and unrecorded period, or in consequence of the invasions of the Saracenic Moors, the constitution of the inhabitants differs

The Calabrian Provinces.

NAPLES. from that of other Europeans. According to Craven their stature is low, and seldom possesses symmetry. The outline of the face generally resembles that of the Africans; the complexion is either a pale olive, or a highly tinted copper-colour; the hair sometimes straight but oftener crisp, like that of the Negroes, and universally coarse and black. People in easy circumstances are however distinguished by a considerable share of personal attractions, and the traveller just mentioned informs us that the most beautiful human being he had ever seen was a young female in the neighbourhood of Reggio. The scenery of the Country, in general possessing a picturesque outline, is rendered extremely beautiful by the luxuriant thickets of evergreens which in many places clothe the surface. The tract extending from Spartivento to the vicinity of Reggio, is for the most part an exception to this description; the surface is there rocky, parched, and bare, and the scenery dreary without grandeur or sublimity. Aspromonte, the *Rhæginus Vertex* of the Roman Geographers, rises to a great height in this part of the peninsula. Further to the North the ground becomes low and level, and at the mouth of the Corace, where the two seas are distant but twenty miles, it is thought that a canal might at a moderate expense form a communication between them. By a comparison of their appearances, where they may be observed at one view, it is found that the Ionian Sea is of a light green colour, and the Tuscan of a dark blue: the experience of navigators, it may be observed, has led them to remark that a pale colour in the waters of the sea indicates a less depth than where the hue is a deep azure. These Provinces do not in general rank high with respect to the articles which they supply to commerce. The olive-tree rises to the height of lofty timber, and though receiving no other attention than the clearing away of weeds which might exhaust the soil about the roots, affords an abundant crop of excellent fruit. In addition to the oil of this fruit, the most important productions are timber, corn, wine, and manna. The sugar-cane is found wild, and is sometimes cultivated rather for use in its fresh state than for the production of sugar. Cosenza, the Capital of Calabria Citeriore, is delightfully situated in a fertile and extensive valley, and at the confluence of the rivers Crati and Basiento. Though the See of an Archbishop, and containing nineteen churches, it is a poor and ill-built town. Under its ancient name, *Consentia*, it has some celebrity in History as the place in which Alaric, the mighty King of the Goths, died. The river Basiento rolls over his tomb, which was placed there by his followers after they had caused a temporary change to be made in the course of the stream. Reggio, the Capital of the most Southern division of Calabria, was completely destroyed by the earthquake of 1783, and has since been rebuilt in a regular and handsome style. It is situated on the shore of the Strait of Messina, over which it commands a magnificent prospect. Messina rises out of the waves like a grand amphitheatre, and the Strait, bordered with villages and towns, seems a noble river between two bold shores. The scene is sometimes still further enlivened by the appearance of the singular optical illusion of the *Fata Morgana*. (See MIRAGE.) The neighbouring country is remarkable for the variety, luxuriance, and delicious flavour of its fruits. Bananas and pine-apples ripen in the open air, and the bunches of grapes are of such enormous size as to suggest the recollection of the cluster borne off by two men to give the Israelites some idea of the fertility of their promised land.

VOL. XXV.

Notwithstanding the great evil of an improvident and oppressive Government, the genial climate and fertile soil of Naples produce a large quantity of valuable articles of commerce; and so great is the capability of the Country that the supply might be incalculably increased under a more judicious Government. Wine is the principal object of the cultivator's attention; and it is computed that the number of individuals employed on the vineyards is double of that engaged in tilling corn. The Neapolitan peasantry consume a great quantity of wine; a single labourer will often drink a dozen bottles in the course of the day, and this great internal demand prevents the exportation of this article from bearing a considerable proportion to the production, so that it seldom exceeds the value of 200,000 ducats in any year. The annual average quantity of corn produced is 12,000,000 quarters, but as the population is principally supported on that article of food, the value of the surplus exported amounts on an average but to 1,000,000 of ducats. Olive oil constitutes the principal article of exportation; it is produced in such abundance that an individual has been known in one year to sell to the amount of £15,000 off his estate. The total amount of this article exported is on an average 2,800,000 ducats. Flax, hemp, and various articles made of them, amount to 800,000 ducats annually. Silk, though produced in very great quantities, is not exported in the same proportion, as it is the favourite wear of the Neapolitan females. Its annual amount is stated at 450,000 ducats. A great variety of miscellaneous articles, almost invariably in a raw state, constitute the remainder of the amount of the exports, valued at 9,000,000 ducats. Of 10,000,000 ducats, to which the imports are estimated to amount, the principal part must be charged to woollen goods, cotton, raw and manufactured, leather, manufactured silk, hardware, tobacco, sugar, and salt-fish. The great quantity of cheese used by the Neapolitans with their macaroni renders it a considerable article of import, seldom falling in amount below 500,000 ducats. In estimating these sums the ducat is taken as a money of account of the value of 3s. 9d.

The annual income derived by the Crown of Naples from its Continental dominions is estimated at 13,000,000 ducats; of which 7,000,000 are produced by land-tax, 2,000,000 by duty on salt, 800,000 by other branches of excise, 1,500,000 from the demesnes of the Crown, and 1,500,000 from Customs.

Accounts are kept at Naples in ducats, *carlini*, and *grani*. The ducat at par is worth 3s. 9d. sterling, and contains 10 *carlini*, and each *carlino* contains 10 *grani*. The principal coins are gold pieces of the value of 2, 4, and 6 ducats; silver pieces of the value of a ducat, and of half a ducat, bearing the name of *pataca*; also smaller pieces of the value of 12 and of 6 *carlini*, and the *taro*, or piece of 2 *carlini*; the copper coins are pieces of $1\frac{1}{2}$ *grani*, of 1 *grano*, and the *tornese* of the value of $\frac{1}{2}$ *grano*. The principal long measures are the *canna* = 6 feet 11 inches, and the *palmo*, of which 8 are contained in the *canna*. Land is measured by the *moggia*, of which 5 = 4 English acres. Corn is measured by the *carro*, which contains 36 *tomoli*, and 7 *tomoli* = 10 English bushels nearly. The principal commercial weight is the *cantaro* = 196 pounds avoirdupois, and divided into 28 *rottoli*. Wine is measured by the *bar-rile* = 11 English gallons. Oil is measured by the *salma*, which contains 80 English gallons.

The Literature of the Neapolitan territory presents

Literature.

NAPLES. us with some of those names which have done most honour to the Human intellect. In ancient times, it produced, amongst a host of writers of less celebrity, Pythagoras, Ennius, Lucilius, Horace, Cicero, and Statius. In modern times the first who holds a prominent place in the history of the human intellect, is Cesar Baronio, better known under the Latin form of Baronius. He was a native of Sora, and, besides other Works, produced as the fruits of forty years' labour, his *Annales Ecclesiastici*, a wonderful monument of industry, and an invaluable, although not always accurate guide through the mazes of Church History during the first twelve centuries. The unfortunate Querno, styled by Pope "the antichrist of wit," was a native of Monopoli. He committed suicide, being unable to endure the ridicule and humiliation which he endured at the Court of Leo X., who amused himself with the simple vanity of the poor enthusiast. Scarcely less melancholy were the results of the transcendent poetical powers of Tasso, who has left his history as an additional instance to the many previously existing, that preeminence of genius too often produces a more exceeding weight of misery. Sorrento claims the honour of his birth. Pontanus, born 1426, at Cereto, a village in the Apennines, was celebrated for the elegance and purity of the Latin style employed in his numerous compositions. Influenced by the irritable and susceptible temperament which too often forms the bane and blemish of the literary character, he exhibited instances of fickleness and ingratitude which proved how little great intellectual powers ensure moral excellence. Sannazaro, born at Naples in 1458, was by his contemporaries styled the Christian Virgil, in consequence of his poem *de Partu Virginis*, from which it will perhaps be found that even Milton has not disdained to borrow. His *Arcadia* was, however, his most popular Work, of which above sixty editions were published previously to 1600. Some critics have censured his choice in the subject of his *Piscatory Eclogues*, but angling has been a frequent and legitimate theme for the Poet, and the serene and cheerful climate and unrivalled scenery of Naples, render fishing a delightful occupation, which affords many pleasing topics for descriptive Poetry. Tansillo, the contemporary of Tasso, is best known by his poem *La Balia*; he is also distinguished by having produced *I due Pellegrini*, regarded as the earliest Dramatic Poem of Italy. In the XVIIth century, Gravina was equally distinguished as a jurist and a critic. Campanella, who flourished at the same time, suffered persecution for his bold Metaphysical speculations, still valued by the best judges in that department of Science. The discovery of Herculaneum and Pompeii caused the intellectual activity of the Neapolitans during the XVIIIth century to be principally directed to the study of antiquity. The dialect of the lower Order of Neapolitans is a *patois*, more remote from the Latin stock than any other extensively spoken in Italy. The pronunciation is rough and guttural; as a vehicle of Literature it is confined to popular songs, and a few trifling compositions which circulate among the common people.

Dialect.

Carbonari.

The origin of the secret Society of the *Carbonari* (coaliers) is to be attributed to the policy of Queen Caroline, (of Austria,) whose emissaries, in 1812, organized it as the means of subverting the authority of Murat. The association spread rapidly in Abruzzo and Calabria, whence it extended over the whole Kingdom with so great activity, that the number of the initiated at present is cal-

culated to exceed 200,000. The leaders of the association thought it advisable, in 1813, to exclude such Members as they regarded less suited for the execution of their projects, and those rejected associated themselves under the name of the *Calderari*. (braziers,) and from resentment and rivalry entertained implacable hatred against their late associates. The more powerful sect of the *Carbonari*, having become an object of suspicion to the Ministers of the Crown, in consequence of the free principles naturally pervading a self-constituted association under an oppressive Government, was still treated with caution and leniency until the Prince of Canosa became Minister of police. He declared himself the chief of the *Calderari*, from whom he exacted an oath that they would pay implicit obedience to his commands, and by all expedients exterminate the *Carbonari* and Free Masons, between which associations a mysterious union was supposed to exist. Canosa had the audacity to distribute, unauthorized by the Royal authority, 20,000 stand of fire-arms among the *Calderari*, and a Civil war seemed imminent, until the King, made acquainted with these machinations, degraded and sent him into exile. The *Carbonari*, the active promoters of those political commotions which agitated Naples in 1821, are at present regarded by the Government with much alarm, and persecuted with great but ineffectual severity. Their influence is still increasing among the people, and would be irresistible but for the control powerfully exercised by foreign States. Their political tenets are glossed over by a specious application of the doctrines of the Gospel. In their discourses they ever set forth Jesus as an object of their pity and affection, who was himself the innocent victim of cruelty and glorious pattern of persecuted virtue. One of the *initiated*, who gave Count Orloff an insight into the objects and tenets of the Society, observed that, in consequence of these Religious views, all classes of persons, lazzaroni, peasants, monks, pastors, receive with respect and admiration the discourses of the Members, and eagerly press to become associates, and (if we may so lightly use the words of Scripture) to take those precious privileges by violence. The *Carbonari* call their Clubs *vendite*, markets; for the coal-trade furnishes them with watch-words, as architecture supplies symbolical terms to the Free-Masons. The professed object of the association is to clear the Country of the wolves which infest it; and by this term they mean tyrants as the most destructive enemies of public liberty. They have different ranks and use various symbolic signs, among which that of the Cross is the principal. In their meetings all their measures and discourses have a democratical tendency, combined with an exalted morality practically exhibiting its influence in surprising changes in the conduct and character of the votaries. At Naples ferocious lazzaroni, and in the Provinces abandoned and desperate freebooters, have, as soon as initiated, exhibited instances of admirable disinterestedness and benevolence.

The History of Naples, as an independent State, dates long after its territory formed a portion of the civilized world. Southern Italy having been part of the Roman Empire on its fall, was conquered by the Goths, and wrested from them by the Greeks of the Lower Empire, who, in their turn, were expelled by adventurers from Normandy, on whose Chief, Robert Guiscard, the Pope bestowed the investiture of nearly the present Neapolitan dominions. In 1192, the Emperor Henry VI., of the House of Swabia, made himself master of the

NAPLES.

NAPLES. Kingdom, which he claimed in right of his Empress, the posthumous daughter of Roger, the first Guiscard who assumed the title of King. On the death of his son and successor, Frederic II., Pope Urban IV. having alleged that the territory had reverted to him as a lapsed fief, conferred it, in 1264, on Charles Count of Anjou, brother of Louis IX. of France. In 1282, the revolt, so celebrated under the name of the Sicilian Vespers, exterminated the French troops which occupied Sicily; and the inhabitants transferred their allegiance from Charles to Peter of Arragon, who alleged a title derived from his marriage with the daughter of one of the numerous claimants of the Crown. The separation of the two Countries continued until Alphonso, King of Arragon and Sicily, having been adopted by Joan II., on her death, in 1435, succeeded to the throne of Naples, with which he reunited the Insular possessions. The Princes of the House of Arragon continued to occupy the throne till about the close of the XVth century, when it was seized by Ferdinand of Spain. In 1707, the Emperor Joseph I. succeeded in wresting Naples from Philip V. of Spain; and in 1720, his successor, Charles VI., by Treaty, added to it the Island of Sicily. This contested territory again changed masters in 1734, when Don Carlos, son of Philip V., succeeded in acquiring possession of it, and in securing his acquisition by the Treaty of Vienna. On his accession to the Throne of Spain, in 1759, he transmitted the Sovereignty of the Two Sicilies to his third son, Ferdinand IV. Under this dynasty it remained till occu-

pied by the French in 1799; and after the battle of Marengo, Napoleon declared that the Bourbons had ceased to reign in Naples. In 1806, he gave this conquest to his brother Joseph, who for two years enjoyed the name of King, and, in 1808, he again transferred the temporary usufruct to his brother-in-law Joachim Murat, and Joseph took rank as King of Spain. After the downfall of Napoleon, and the violent death of Joachim, the Bourbon Ferdinand was restored in 1815. He died in 1825, and was succeeded by his son Francis, the present King.

NAPLES.
—
NARRA-
TION.

NARAVELIA, in *Botany*, a genus of the class *Polyandria*, order *Polygynia*, natural order *Ranunculaceæ*. Generic character: corolla, petals six to twelve, longer than the calyx; seed-vessel on a thick footstalk, seated in a hollow.

One species, *N. Zeylanica*, native of Ceylon.

NARCISSUS, in *Botany*, a genus of the class *Hexandria*, order *Monogynia*, natural order *Narcissi*. Generic character: corolla six equal petals, nectary funnel-shaped, one-leaved; stamens within the nectary.

Nearly sixty species of this elegant and generally cultivated genus have been discovered, mostly natives of Europe. The flowers are highly fragrant and ornamental, and expand early in the Spring. *N. biflorus*, *Pseudo-Narcissus*, the common Daffodil, and *N. poeticus*, are natives of England; the last is also a native of the South of Europe, and is thought to be the Narcissus of Ovid; *N. jonquilla*, the Jonquil, is a native of Spain; *N. bulbocodium*, with a nectary formed like a hoop-petticoat, is a native of Portugal. All the species are easily cultivated, several flower well in water, but the heat of a room with a fire, draws the stem to an unsightly length, and weakens the flower.

NARCO'TICK, *adj.* } Fr. *narcotique*; It. and Sp. *narcotico*; Gr. *ναρκωτικός*, from *ναρκο-ειν*, to benumb, to stupify. See the Quotation from Holland.

For he had yeven drinke his gayler so
Of a clarre, made of a certain wine,
With *narcotikes* and opie of Thebes fine,
That all the night through that men wold him shake
The gailer slept, he mighte not awake.

Chaucer. *The Knights Tale*, v. 1474.

Narcoticke medicines, bee those that benum and stupifie with their coldnesse, as opium, hemlocke, and such like.

Holland. *Plinie. Explanation of the Words of Art.*

Medicines which they call *narcotical*, that is to say, such as benowme and dead the diseased.

Harmer. *Translation of Beza*, (1587,) p. 421.

Arresting that impetuous motion of the spirits,—as those things do, that pass for *narcotically* cold.

Whitelock. *Manners of England*, p. 222.

Pale, meagre, muse-rid wight! who reads in vain

Narcotic volumes o'er. Shenstone. *Economy*, p. 3.

NARD, Fr. *nard*; It. and Sp. *nardo*; Lat. *nardus*; Gr. *νάρδος*.

But the good, sincere, and true *nard* is known by the lightness, red colour, sweet smell, and the tast especially: for it drieth the tongue, and leaveth a pleasant relish behind it.

Holland. *Plinie*, book xii. ch. xii.

— There eternal Summer dwells,

And West-winds, with musky wing,

About the cedarn alleys fling

Nard and Cassia's balmy smells.

Milton. *Comus*, l. 991.

NARDUS, in *Botany*, a genus of the class *Triandria*, order *Monogynia*, natural order *Gramineæ*. Generic character: calyx one-flowered, one-valved; corolla one-valved, enclosed; flowers in a spike, alternately sessile.

Three species, grasses, natives of Europe and North America.

NARRATION, } Fr. *narration*; It. *narrazione*;
NA'RRATIVE, *adj.* } Sp. *narracion*; Lat. *narratio*,
NA'RRATIVE, *n.* } from *narrare*, *gnarum reddere*, to
NARRA'TOR, } make known, to tell.
NA'RRATORY. } A tale, a story; a relation of a

story.

NAR-
RATION.
—
NAR-
ROW.

Indeuouring thereby to proue, that the opinion of giants is not altogether grounded vpon vaine and fabulous *narrations*, inuented onlie to delight the eares of the hearers with the report of maruellous things.

Holinshed. The Description of Britain, vol. i. ch. v. p. 14.

Therefore by this *narratiue* you now vnderstand the state of the question, whereupon the king prayeth your aduice.

Bacon. King Henry VII. fol. 53.

Hee is but a *narrator* of other men's opinions, suspending his owne judgment, sometime peradventure when hee should not have so done.

Mountague. Appeal to Cæsar, ch. i. p. 5.

Now, letters, tho' they be capable of any subject, yet commonly they are either *narratory*, oburgatory, consolatory, monitory, or congratulatory.

Howell. Letters, book i. sec. 1. p. 17.

Chiefs, who no more in bloody fights engage,
But wise through time, and *narrative* with age.

Pope. Homer. Iliad, book iii.

Perchance some hackney, hunger-bitten scribler,
Insults thy memory, and blots thy tomb
With long flat *narrative*, or duller rhymes.

Blair. The Grave.

NA'RRROW, *v.* } A. S. *narw*, *nearw*, *nearwe*. The
NA'RRROW, *adj.* } past part. of *nyrwian*, *coarctare*,

NA'RRROWNESS. } gether, to compress, to contract.

Tooke. See NEAR, and NORTH.

To draw *near* together, to compress, to contract, to confine, to constrain, to straighten, to tighten.

Toward þe wode, fram wanne he come, þe Brutons gonne to fle,
Ac þo hii come among *narwe* heggys, hii stode agen anon.

R. Gloucester, p. 211.

He býþozte hým wel *narwe*, zýf þer mýgta be ený red,
þoru wýuýnge, oþer þoru ený þýng.

Id. p. 294.

Neuerþeles at Karham was the bataile gýuen,
þe kýng was *narow* holden, his folk alle to drýuen.

R. Brunne, p. 16.

Hou streit is the gate and the wey *narowe* that ledith to lyf, and
ther ben fewe that fynden it.

Wiclif. Matthew, ch. vii.

Jalous he was, and held hire *narwe* in cage,
For she was wild and yonge, and he was old.

Chaucer. The Miller's Tale, v. 3225.

Here may ye seen, how excellent franchise
In women is whan they hem *narwe* avise.

Id. The Marchantes Tale, v. 9862.

Hir front was *narowe*, hir lockes hore.

Gower. Conf. Am. book i. p. 30.

Thou lokest *narowlye* vnto all my pathes, & markest the steppes
of my fete.

Bible, Anno 1551. Job, ch. xiii.

Without in the wall of the house, he made *narrowed* rests round
about, that the beams should not be fastened in the walls of the
house.

Id. Modern Version. 1 Kings, ch. vi. ver. 6.

So in our streets sly beggers *narrowly*
Watch motions of the giver's hand or eye,
And evermore conceive some hope thereby.

Donne. Letters. To Mr. T. W.

[Men] should accustome themselves, by the light of particulars,
to enlarge their mindes to the amplitude of the world, and not re-
duce the world to the *narrowness* of their mindes.

Bacon. Natural History, Cent. iii. sec. 290.

Let him be exact and impartial in the great work of self-exami-
nation, looking often and *narrowly* into the state of his soul, and
clearing all accounts and old scores between God and his conscience.

South. Sermons, vol. vi. p. 259.

What virtue is there in a tragedy, which is not contained in an
epic poem; where pride is humbled, virtue rewarded, and vice
punished; and those more amply treated, than the *narrowness* of the
drama can admit.

Dryden. Dedication to the Æneid.

Here lies our good Edmund, whose genius was such,
We scarcely can praise it, or blame it too much;
Who, born for the universe, *narrow'd* his mind,
And to party gave up what was meant for mankind.

Goldsmith. Retaliation, 1774.

Society in despotic governments is *narrowed* according to the de-
gree of rigour which the ruling tyrant exercises over his subjects.

Observer, No. 21.

NARTHECIUM, in *Botany*, a genus of the class
Hexandria, order *Monogynia*, natural order *Junci*.
Generic character: corolla, six petals, spreading, per-
sisting; filaments thread-like, hirsute; capsule superior,
prismatic; seeds attached to both sides.

One species, *N. ossifragum*, native of boggy places in
England. *Eng. Bot.*

NARWHALE, a species of whale, so called from the
size of its *nares*, or nostrils.

Nor is it to be omitted what hath been formerly suspected, but
now confirmed by Olaus Wormius and Thomas Bartholinus, that
those long horns preserved as precious rarities in many places, are
but the teeth of *narh-whales*, to be found about Island, Greenland,
and other Northern regions.

Sir Thomas Brown. Vulgar Errours, book iii. ch. xxiii. p. 205.

NAS, *i. e. ne was, was not.*

And thre yere in this wise his lif he ladde,
And bare him so in pees and eke in werre,
Ther n'as no man that Theseus hath derre.

Chaucer. The Knightes Tale, v. 1450.

For pittied is mishap that *nas* remedie,
But scorned bene deedes of fond foolerie.

Spenser. Shepherd's Calendar. May.

NASA, in *Zoology*, a genus of *Gasteropodous Mol-
lusca*.

Generic character. Shell convoluted, turritid; with
a canal scarcely produced beyond the anterior margin of
the lip, and turned towards the left, very short, and
obliquely truncate; spire produced.

Type of the genus, *Buccinum reticulatum*, Linnæus;
Pen. Brit. Zool. vol. iv. p. 122. pl. lxxii. fig. 92. Se-
veral species, of which at least five exist on the British
shores.

NA'SAL, *adj.*

NA'SAL, *n.*

NASA'LITY,

NA'SICORNOUS,

Lat. *nasus*, the nose.

Of or pertaining to the nose.

When the discharge lessens, pass a small probe through the *nasal*
duct into the nose every time it is drest, in order to dilate it a little.

Sharpe. Surgery.

Sneezing, masticatories, and *nasals* are generally receaved: Her-
cules de Saxonia relates of an empirick in Venice that had a
strong water to purge by the mouth and nostrils, which he still used
in head melancholy, and would sell for no gold.

Burton. Anatomy of Melancholy, fol. 384.

And some unicorns we will allow even among insects, as those
four kinds of *nasicornous* beetles described by Muffetus.

Sir Thomas Brown. Vulgar Errours, book iii. ch. xxiii. p. 203.

The liquid *nasal* follows these, being formed by the tongue and
roots of the teeth, with a little assistance from the other organ: and
we must particularly remember, when we attend to the pronuncia-
tion of Indian dialects, that most sounds of this class are varied in
a singular manner by turning the tongue upwards, and almost
bending it back towards the palate, so as to exclude them nearly
from the order, but not from the analogy, of dentals.

Sir William Jones. Works, vol. iii. p. 286. *On the Orthography
of Asiatick Words.*

The Indian sound differs only in the greater *nasality* of the first
letter.

Id. Ib. p. 284.

NASCENT, Lat. *nascens*, growing, from *nasci*, to
grow.

Growing, rising, or springing up.

As the soul animates the whole, what nearly touches the soul re-
lates to all. Therefore the asperity of tartarous salts, and the fiery
acrimony of alkaline salts, irritating and wounding the nerves, pro-
duce *nascent* passions and anxieties in the soul.

Berkeley. Works, vol. ii. p. 507. *Siris.*

ROW.
—
NAS-
CENT.

NASSAU. NASSAU, Dukedom of, a small independent State of Germany, bounded on the West and North by the Rhenish Provinces of Prussia and Westphalia, East and South by the Hessian territories, has a superficial extent of 2000 square British miles. It is a hilly, broken country, having two principal ranges of mountains, the Westerwald in the North, the Taunus in the South-West; the wide valley which stretches between these ridges is drained by the river Lahn, nearly equidistant from each. The most elevated points within the territory are two summits of the Taunus, respectively 800 and 1000 feet high. The Rhine flows along the Southern and Western frontiers from the mouth of the Main to that of the Lahn, and greatly contributes to the beauty and fertility of the Rheingau, a tract extending along its Northern bank, and celebrated as the most picturesque and productive in Germany. The Main for a short distance flows along the South-Eastern frontier, and part of its course lies within the limits of the Dukedom. The Lahn is however the principal river, as nearly the whole of its course lies within the territory: it is deep enough for boats of considerable burthen, and therefore presents great advantages in consequence of affording communication with the extensive inland navigation of the Rhine. Nassau abounds with mineral springs, among which that of Selters is the best known. These waters attract visitors to the annual average number of 10,000; and from them 3,000,000 jars of water are exported every year. The climate is mild, agreeable, and remarkably salubrious, especially to the South of the mountains, which shelter it from the Northern winds.

Physical features.

Productions.

Wines are the staple article of agricultural industry, and those produced at Johannisberg, Rudesheim, Markbrunn, Schierstein, and Hochheim, are well known to the commercial and luxurious throughout Europe. The annual average amount of the vintage is about 1,400,000 gallons. There is a great number of standard fruit trees, especially of chestnuts and apples, and large quantities are exported. The principal corn crop is wheat, of quality so excellent that in the Dutch market it brings twenty per cent. more than that of any other Country. The culture of potatoes is rapidly extending. Tobacco, hops, flax, and hemp are after these the most important objects of culture. The extensive woods, besides excellent timber, yield tar and potash. In 1818, the live stock was found by enumeration to be as follows: horned cattle 175,080, horses 9735, sheep 172,737, swine 64,103, goats 10,979. Among the mineral productions iron is the most important, as about 100,000 cwt. are annually brought to market; the lead-mines yield annually 12,000 cwt., and an insignificant proportion of silver. Nassau is altogether an agricultural Country, and has no manufactures worth enumerating.

Population.

The population, in 1817, amounted to 301,907 persons, of whom 161,165 are Protestants, 135,213 Roman Catholics, and 5529 Jews.

Political organization.

The Duke of Nassau, previously an absolute Sovereign, in 1817 gave his subjects a Representative Constitution, in which the most important functions are discharged by two Houses, one of Lords, twelve in number, six taking their seats by hereditary right, six as deputies of ennobled landowners; the Lower House consists of twenty-two Members, four of whom represent those engaged in the functions of Religion and education, three represent the commercial class, and fifteen those landowners who are not ennobled. The elections are septennial, and the sessions annual. Nassau, in

conjunction with Brunswick, holds the thirteenth place in the Germanic Confederacy, and has two of the seventy-one votes which determine its measures. Its quota of troops to the Confederacy is fixed at 3027; the military establishment is at present 1600.

The revenue, in 1817, amounted to £155,781, of which £75,000 were derived from the landed property of the Duke; in the same year the expenditure amounted to £153,341; the public debt amounted, at the close of the Revolutionary war, to £500,000, but great progress has been made in discharging it.

Nassau is divided into twenty-eight judicial districts. Wiesbaden, the Capital, situated on the right bank of the Rhine, in latitude 50° 5' North, longitude 8° 9' West, is a small place containing but 5138 inhabitants. The population of no other town in the Duchy amounts to this number, nor do any contain objects meriting particular notice.

Habel, *Beyträge zur Naturgeschichte und Oekonomie der Nassauschen Länder*, Dessau, 1784, 8vo.; Steubing, *Matersalen zur Statistik und Geschichte der Oranien-Nassauschen Länder. Staats-und Address-handbuch des Herzogthums, Nassau*, 8vo. 1819.

NASSAUVIA, in *Botany*, a genus of the class *Syngenesia*, order *Segregata*. Generic character: flowers collected into a head, with intervening scales; calyx four or five flowered, double, the interior five-leaved, exterior three-leaved; corolla tubular, slightly two-lipped; receptacle naked; down four or five bristled, caducous.

One species, *N. suaveolens*, native of the Straits of Magellan.

NASTURTIUM, in *Botany*, a genus of the class *Tetradynamia*, order *Siliquosa*, natural order *Cruciferae*. Generic character: pod roundish, (sometimes shortened,) valves concave, nerveless, not carinated; cotyledons accumbent; calyx spreading.

A genus divided from *Sisymbrium*, containing six species, natives of Europe. *S. sylvestre*, *terrestre*, *amphibium*, and *officinale*, the Water-cress, are natives of England.

NA'STY, } Skinner derives from the Ger. *nass*; **NA'STILY**, } *D. nat, madidus, humidus, q. d. nimita* **NA'STINESS**. } *illuvie sordens*; and *nass* (Wachter) from *netzen*, to wet, Goth. *natjan*.

Wet, damp, miry; wet or damp to a foul or filthy degree; consequentially, foul or filthy, defiled, polluted.

No doubt some moldy tale,
Like Pericles, and stale
As the shrieve's crusts, and nasty as his fish-
Scraps, out of every dish
Thrown forth, and rank'd into the common tub,
May keep up the play-club.
Ben Jonson. The just Indignation the Author took, &c.

The most pernicious infection, next the plague, is the smell of the jail, when prisoners have been long, and close, and nastily kept.
Bacon. Natural History, Cent. x. sec. 914.

Sin is the uncleanness of the soul, that cleaves closer to it, than any outward nastiness can to the skin.
Hall. Works, vol. iii. fol. 824. Cases of Conscience, dec. iii. case 3.

Many there are who embrace dunghills, the filth and offensiveness of whose lives does exceed them, and who are sordidly and nastily habited, whose clothes are but an emblem of their hearts, and a lively picture of their manners.

South. Sermons, vol. x. p. 4.

The swine is as filthy when he lies close in his sty, as when he comes forth, and shakes his nastiness in the street.

Id. Ib. vol. viii. p. 18.

NASSAU.
NASTY.

NASTY.
—
NASUA.

Last of the toiling race there liv'd a pair,
Bred up in labour and inur'd to care!
To sweep the streets their task from sun to sun,
And seek the nastiness which others shun.
Jago. The Scavengers.

NASUA, from the Latin *nasus*, a nose; Storr, *Coati*. In *Zoology*, a genus of animals belonging to the tribe *Plantigrada*, family *Carnivora*, order *Sarcophaga*, class *Mammalia*.

Generic character. Incisive teeth six in either jaw, the upper outer one on each side sharp and conical; cuspid long, conical, sharp, and angular; molar six on a side in both jaws, the three anterior pointed and cutting, the three posterior tubercular and grinding; muzzle very pointed, nose very long and movable; ears small and oval; body hairy, tail long and covered with hair; feet plantigrade and five-toed; claws sharp and falcular.

The Coatis in the form of their teeth very nearly resemble the Raccoons, and, together with these, the Bears and Badgers, approach nearer omnivorous feeders than the other genera found in the same order. They are very remarkable for the great elongation of the nose, which is extended into a kind of trunk, pierced at the tip by oval nostrils, which extend along the sides in form of semicircular slits, and are provided with whiskers, also found about the eyes. In size they nearly equal the Fox; the body is long and covered with thick hair, the legs are short, and the tail, about equalling the length of the body, is carried either horizontally or elevated. They live in the woods, either alone or in pairs, but do not burrow. They feed on fruit, insects, and reptiles, which they hunt by scent; they grub up the earth with their long snout like Hogs, when in search of their prey, which they convey to the mouth with their fore paws, and sit upright like Dogs. They are easily tamed, and fond of caresses, but never attach themselves, and cannot be allowed to go at liberty, as they run and climb every where, moving their nose about incessantly, and prying into every hole and corner where they have the least notion any thing is to be obtained; and this disposition cannot be overcome even by correction. When angered, they utter a kind of very shrill bark, but if pleased a sort of gentle whistle.

N. Rufa, Storr; *Viverra Nasua*, Lin.; *le Coati Roux*, Buff.; *Brazilian Weasel*, Pen; *Red Coati*. Length of the body about fifteen inches, tail fourteen, general colour bright rufous, paler on the neck, and deeper on the back, where the hairs are ringed with black; the nose is greyish-black, and the sides of the head greyish, under part of the lower jaw white; above and below the eye, and between it and the ear is a little white spot; the back of the ears black, the inside white; outside of the fore legs black; the tail is ringed alternately with rufous and black. It inhabits Brazil and Guiana, and climbs trees with great facility; it carries its tail perpendicular to the body, and puts it between its legs before going to sleep. Linnaeus kept one a considerable time, but did not succeed in taming it; he mentions that it was very obstinate and capricious, killed the poultry, tore off their heads, and sucked their blood; it defended itself with great spirit if taken hold of against its inclination, and stuck fast to the legs of those whose pockets it wanted to ransack, and carried off whatever it found; but could easily be driven away by a brush made of Hog's bristles, to which it had an especial aversion: it slept from midnight to noon, but during the remainder of the day remained awake, and

from six to midnight walked about continually without minding the weather.

N. Fusca, Storr; *Viverra Narica*, Lin.; *le Coati Brun*, Buff.; *Brown Coati*. Same size as the last; general colour blackish-brown, mingled with a little grey on the upper parts of the body; dingy yellow beneath, especially on the neck and chest between the fore legs; the head is grey, the sides of the nose black, bordered on the upper edge with two white stripes, which pass from the angle of the eye to the middle of the snout, where they are gradually lost; above and below each eye is a white spot, and a third behind the outer corner: the tail is alternately ringed with black and dingy yellow. It is found in Brazil, Paraguay, and Guiana, climbs as well as a cat, and is extremely troublesome from turning over every thing which comes in its way.

Three varieties of this species are mentioned by Fred. Cuvier, the most common of which has the skin less black, and the grey colour tawny; the second has the tail of a uniform colour; the third has no white streaks on the nose, and the fourth has the tip of the nose white.

See Storr, *Prodromus Methodi Mammalium*; Cuvier, *Règne Animal*.

NASUTE, Lat. *nasutus*, having a large nose, (*nasus*), a quick smell.

They are commonly discovered by a *nasute* swine purposely brought up.

Evelyn. Miscellaneous Writings, p. 747. *Acetaria*, 39.

NA'TAL, adj. } Fr. *natal*; It. *natale*; Sp. *natal*;

NATAL'TIAL. } Lat. *natalis*, pertaining to the birth or nativity. *Natal Jove*, i. e. Jove presiding over the birth or nativity.

Now nece mine, by *Natal* Jove's feast,
Were I a God, ye should sterve as yerne.

Chaucer. Troilus and Creseide, book iii. p. 252.

We read in the life of Virgil, how far his *natalit* poplar had outstrip'd the rest of its contemporaries.

Evelyn, book iv. sec. 13.

Safe in the hand of one disposing power,
Or in the *natal*, or the mortal hour.

Pope. Essay on Man, epis. 1. l. 286.

NATATION, Lat. *natatio*, from *natare*, and that from *nare*, to swim; Gr. *νέω*.

And first, that man should swim naturally, because we observe it is no lesson unto other animals, we cannot well conclude; for other animals swim in the same manner as they go, and need no other way of motion for *natation* in the water, than for progression upon the land.

Sir Thomas Brown. Vulgar Errors, book iv. ch. vi. p. 245.

NA'THELESS, } i. e. *na* or not, not the *less*.

NA'THEMORE. } Not the more. *Natheless* has given way to *never-the-less*, q. v.

An *naples* he wende toward hys son myd al hys poer vaste,
Vor to smyte an *batayle*.

R. Gloucester, p. 320.

Neples þe clerk Merlyn sais certeyn,
That Bretons at þe last salle haf þis lond agayn.

R. Brunne, p. 7.

Netheless love ye youre enemyes and do ye wel.

Wiclif. Luke, ch. vi.

But *nathelesse* I trow that she
Was faire sometime, and fresh to see,
When she was in her rightfull age.

Chaucer. The Romant of the Rose, p. 174.

And *natheless* by daies olde,
Whan that the bokes weren leuer,
Writyng was beloued euer
Of them, that weren vertuous.

Gower. Prologues, p. 7.

Yet *nathemore* by his bold hartie speach
Could his blood frosen hart emboldned bee,
But through his boldnes rather feare did reach.
Spenser. Faerie Queen, book i. can. 9.

Not like those steps
On heaven's azure; and the torrid clime
Smote on him sore besides, vaulted with fire;
Nathless he so endured, till on the beach
Of that inflamed sea, he stood and call'd
His legions.
Milton. Paradise Lost, book i. l. 299.

NATICA, in Zoology, a genus of *Gasteropodous Mollusca*.

Generic character. Shell operculated, subglobose, umbilicated, aperture entire, semiorbiculate; pillar lip entire, not entering the aperture, with a cavity or callus behind, the latter varying the form of the umbilicus, and occasionally closing it.

Type of the genus, *Nerita glaucina*, Linnæus; Brown, *Illust.* pl. xliii. fig. 1, 2. 8. 10. Rather a numerous genus, consisting entirely of marine shells, adorned with beautiful colours, and smooth; eight recent, and several fossil species are found on the coasts and crags of Britain.

NATION, Fr. *nation*; It. *nazione*; Sp. *nación*, Lat. *natio*, from *nasci*, *natus*; to be born.

The place, country, or region, where any one is born; the people themselves.

Folke of all *nacion*
Bothe p̄fit and imp̄fit.
Piers Ploukman. Vision, p. 309.

Alass! unto the Barbare *nation*
I muste gon, sin that it is your will.
Chaucer. The Man of Lawes Tale, v. 4701.

"My love?" quad he, "nay my dampnation.
Alas! that any of my *nation*
Should ever so foule disparage be."
Id. The Wif of Bathes Tale, v. 6650.

Who made our laws to bind us, not himself,
And hath full right to exempt
Whomso it pleases him by choice
From *national* obstruction without taint
Of sin, or legal debt.
Milton. Samson Agonistes, l. 312.

Therefore I pray let our friendship, let our love, that *nationality* of British love, that vertuous tie of Academic love, be still strengthened (as heretofore), and receive daily more and more vigor.
Howell. Letter 18. book i. sec. 2. p. 106.

There is no *nation* in the world, though plunged into never such gross and absurd idolatry, but has some awful sense of a Deity, and a persuasion of a state of retribution to men after this life.
South. Sermons, vol. ii. p. 15.

The term adulterous chiefly relates to the Jews, who being *nationally* espoused to God by covenant, every sin of theirs was in a peculiar manner spiritual adultery.
Id. Ib.

Mountains interpos'd
Make enemies of *nations*, who had else
Like kindred drops been mingled into one.
Cowper. The Task, book ii.

NATIVE, *adj.* } Fr. *natif*; It. and Sp. *nativo*;
NATIVE, *n.* } Lat. *nativus*, from *natum*, past
NATI'VITY. } participle of *nasci*, to be born.

That can or may bear; causing to be; of or pertaining to birth; coming with, accompanying the birth, inherent from the birth; belonging or pertaining to the kind; the being, essence, or existence of the kind.

Native land; land where any one was born.

Native dust; dust whence any one was created.

Mark biginnith at the sendyng of Joon Baptist, and tellith not the *natyuite* of Crist bi fleisch, but fro Cristis baptym whanne he was ful man.
Wiclif. Prolog. On Mark.

Is not that the glorious cytie, which hath bene of so longe antiquite? whose *natiues* dwelling far of, commende her so greatlye.
Bible, Anno 1551. Esaye, ch. xxiii.

For I myselfe, loo! thynges moste vustable.
Formed in offence, conceaued in lyke case
Am noughte but synne from my *natyuite*.
Wyatt. Psalm 51.

But he for to shew that he hath not left his anxious fauour toward hys *natiue* country, though he be rûne away from it for heresy.
Sir Thomas More. Workes, fol. 306. The Supplicacioun of Soules.

O *natiue* land, Ilion, and of the Goddes.
The mansion place! O warlike walles of Troy!
Four times it stopt in thentrie of our gate:
Four times the harness clattred in the womb.
Surrey. Virgil. Æneis, book ii.

What time the *native* belman of the night,
The bird that warn'd Peter of his fall,
First rings his silver bell t' each sleepy wight,
That should their mindes up to devotion call,
She heard a wondrous noise below the hall.
Spenser. Faerie Queene, book v. can. 6.

For still her cheekes possesse the same,
Which *natiue* she doth owe.
Shakspeare. Love's Labour Lost, fol. 125.

Behold
Whereon the Ægean shore a city stands
Built nobly, pure the air, and light the soil,
Athens the eye of Greece, mother of arts
And eloquence, *native* to famous wits.
Milton. Paradise Regained, book iv. l. 238.

At thy *nativity*, a glorious quire
Of angels in the fields of Bethlehem sung
To shepherds watching at their folds by night,
And told them the Messiah now was born,
Where they might see him, and to thee they came.
Id. Ib. book i. l. 242.

Anaximander's opinion is, that the Gods are *native*, rising and vanishing again, in long periods of times; and that these Gods are innumerable worlds; but how can we conceive that to be a God, which is not eternal?

Cudworth. Intellectual System, fol. 129.

Oh impotent of mind!
Shall these, shall these Atrides' mercy find?
Well hast thou known proud Troy's perfidious land,
And well her *natives* merit at thy hand!
Pope. Homer. Iliad, book iv.

There is something so *natively* great and good in a person that is truly devout, that an aukward man may as well pretend to be genteel, as an hypocrite to be pious.

Tatler, No. 211. col. 2.

And as a child, when scaring sounds molest,
Clings close and closer to the mother's breast;
So the loud torrent, and the whirlwind's roar,
But bind him to his *native* mountains more.
Goldsmith. The Traveller.

NA-
TOLIA.

NATOLIA.

NATOLIA, used by abbreviation for ANATOLIA, is derived from the Greek word Anatolé, (signifying the East,) and was substituted, on the revival of Letters, for the ancient denomination of Western Asia. "When the Romans,"

says Meletius, (*Geogr. ii. § 1. c. 1. tom. iii. 113.*) "had made themselves masters of the greater and most populous part of the known World, they divided their Empire into two parts, the Eastern and the Western; and they

NA-
TOLIA.

Boundaries.

called that the Eastern which to this day, and by the Turks themselves, is improperly termed Anatolè, (*Ἀνατολή*), comprehending not only Asia the Less, but also other Provinces belonging to the Greater Asia; as Lycia, Pamphylia, Cilicia, Armenia the Less, Cappadocia, Galatia, and Bithynia. It is bounded on the North by the Euxine Sea; on the East by the river Euphrates; on the South by the Cyprian Sea; and on the West by the Ægæan Sea, the Hellespont, and the Propontis; and is, as it were, a Peninsula, the isthmus* of which, they say, extends for about 200 miles from the Sea of Issus

to that of Pontus." Under Constantine and his successors, till the VIIth century, this part of the Empire was divided into Diacésises, subsequently into Themes, or Military Governments; and the Turks have subdivided it into six Páshálik, or Vice-royalties, and one Musellimlik, or Government, comprehending also the Island of Cyprus.

The following Table will show the correspondence between the principal divisions established at the above-mentioned periods.

But, taken in the widest sense in which it has been used by modern writers, Natolia comprehends also a portion of the North-Western part of ancient Armenia, and has been divided by the Turks into the following Provinces, or Vice-royalties, (Páshálik,) each containing several Military Districts governed by Sanják Beys, who are distinguished by a standard, (*sanják*), as is implied by their title.

Páshálik.	Sanják, or Livá, (i. e. Military District.)	Principal Towns.
i. Anátólí.	1. Kójah ílí ...	{ Uskudár. (Scútari.) Kádí Kóí. (Chalcedon.) *Iznikmid. (Nicomedia.) I'zník. (Nicæa.)
	2. Khudáven- dikár	{ Yení shehr. *Burúsah. (Prusa.) *Bíghá. (Pegæ.)
	3. Bíghá	{ Sultániyyeh. Kápútághí. (Cyzicus.) Bunár-báshí. (Troja.) *Bálikesrí.
	4. Kará-sí	{ Edremid. (Adramyttium.) Ayázmend. Berghamah. (Pergamum.) *Maghnísá. (Magnesia.)
	5. Sárú-khán ..	{ Ak-hisár. (Thyatira.) Fóchah. (Phocæa.)

* From the head of the Issic Gulf, in 36° 50' North, to Kirasún (Cerasus) on the Euxine, in 40° 48' North, the distance in a straight line measures 238 Geographical miles. This, as the narrowest part, is the proper Isthmus.

Páshálik.	Sanják or Livá, (i. e. Military District.)	Principal Towns.
i. Anátólí.	6. Sighlah* ...	{ *Izmír. (Smyrna.) Vurlah. Menimen. (Temnus.)
	7. Aidin	{ *Tíreh. Guzel hisár. (Tralles.) A'lá shehr. (Philadelphia.) Ayá solúk. (Ephesus.) Sart. (Sardes.)
	8. Menteshá ..	{ *Moghlah. Menteshá. Mesí or Mylasa.
	9. Tekeh	{ *Antáliyah. (Attalia.) Kúprí bázár.
	10. Hamíd	{ *Ispártah. Bárlah. Evshár.
	11. Kará Hisár sáhib	{ *Kará hisár. (Prymnesus.) Búlávádín. (Philomelium.)
	12. Germiyan or Kútáhiyeh.	{ *Kútáhiyeh. (Cotyæum.) Lázikiyyeh. (Laodicea.) Denizlú.

* This name, which is variously spelled by different writers, Sagla, Sagala, Sogla, and Sifla, is used promiscuously with its diminutive Sighlah-jik. (Hájí Khalífah, v. *Tohsetu-thibár*, p. 67. and *Jihán numá*, p. 669, and Rycart, *Ott. Empire*, iii. 3.) It is one of the Military Districts assigned to the Kapúdán Páshá for the maintenance of the Navy, and is called Sighlah in the latter of Hájí Khalífah's Works, and Sighlah-jik in the former. The fortress bearing that name was in a ruinous state when seen by Chandler in 1765, (*Trav. in Asia*, p. 96.) but was considered as of great strength when first possessed by the Turks.

i. The Páshálik, or Vice-royalty of Anátólí* contains fourteen Commanderies, or Military Districts, (Sanjáks,

* The word Anátólí, says Abú Bekr ibn Behrá, the Damascene, quoted by Ibráhim Efendí in his supplement to the *Jihán numá*, (p. 431.) signifies, in the Language of the Yúnán, (Greeks,) "the place whence the sun has risen." It is usually pronounced *Anádólí*, or *Anádólú*, as *tágh* is pronounced *dágh*.

i. e. Standards,) subject to the Páshá, who resides at Kútáhiyeh, and three on the sea-coast belonging to the Páshálik of the Islands, under the administration of the Kapúdán Páshá.

1. Kójah ílí, the Sanják at the North-Western extremity of this Páshálik, is bounded on the East by Bóli, on the North by the Black Sea, on the West by the Canal of Constantinople, and on the South by the Gulf of Iznikmíd and the Sanják of Khodávendikár. Its Kádíliks, or jurisdictions, are A'b-sáfi; Iznikmíd; I'zník; Uskudár; Ak-yází; Ak-hisár; Bázár-kóí; Sári chāir; Sábánjah; Geiveh; Yalák-ábád; Gúrleh; Yavrós; Karah mursel; Samánlú; Karah-sú; Kándirí; Shíleh; Bázár-súí. 1. "Iznikmid, (Nicomedia,) at the extremity of a gulf stretching for 100 miles from the Sea of Constantinople, is a populous but unwalled city." (*Jihán numá*, p. 662.) "Having crossed a small river by a bridge," says Sir William Ouseley, (*Trav.* iii. 514.) "and passed among noble cypress trees, we entered a large town, admirably situate on the side of a mountain, rising with much majesty from the sea, and contributing with others, beautifully wooded, to close a narrow gulf or bay of the Propontis. Nicomedia, the ancient Greek name of this city, has been corrupted into Iz-nicmíd, or Izmíd, by a process not unusual among the Turks.* The town seemed large and very populous; the inhabitants were in general a remarkably handsome race. Beggars of both sexes, and of all ages, were numerous and most importunate; the bread was excellent, and meat and fruit abounded in the market." Being the Capital of the District, it is the residence of the Bey, says the *Jihán numá*, (p. 662.) and is famous for its jami', mosques, gardens, and royal castle. Sir William Ouseley, who passed rapidly through the place, observed no relic of antiquity, except an imperfect Greek inscription, and fragments of sculptured marble; and even Busbequius, who visited the place nearly three centuries ago, says, (p. 77.) *Nihil vidimus spectatu dignum præter parietinos et rudera, hoc est, epistyliorum et columnarum fragmenta, sola ex veteri splendore reliqua*. Nor does Dalloway appear to have been more fortunate, (*Travels*, p. 160.) though he seems to suppose that the Eskí Seráí, placed "on an easy terrace," was probably the palace of Diocletian, and considered as such by Busbequius, whose words, though ambiguous, do not appear to authorize any such supposition. Iznikmíd is in 40° 45' North and 29° 49' East. Pandík, (Pantichium,) Geybúzeh, or Kivízeh, (Dacibyza,) and Máldisem, (Libyssa,) are all on the road from Scútari to Nicomedia. At Díl (Glossa, the ancient Helenopolis or Drepané) there are boats stationed to carry travellers over the gulf, which is there five miles across, but very liable to storms; beyond it are the Kádíliks of Yalák-ábád and Gúrleh; and further on, Samánlú and Kátirlú, at the distance of one farsakh, (three Geographical miles,) the greater part consisting of very high mountains, called Kátirlú and Samánlú, the ancient Arganthonius. The road from Samánlú to Bázár kóí (market village) crosses them. From the wood on these hills many of the baths in Constantinople are supplied with fuel. Gúrleh, in the neighbourhood of the latter place, and three hours (leagues) distant from Gemlik, (Cius, still called Kios by the Greeks,) is a market town, and the residence of

Nice.

a Kádî. Gegbúzeh, (pronounced Geybúzeh,) a town (*kasbah*) near the shore of the gulf, lying between Constantinople and Iznikmíd, has a Mosque, College, Kháns, (hostels,) a Bath, and Almshouse built by Mustafá Páshá, one of the Vezirs of Sultán Suleimán. Izník (Nicæa, or Nice) is celebrated in the *Jihán numá* on account of its ancient fortifications, now in ruins; for its council of 318 monks, held in the time of Cæsar, (Kaïsar,) for the purpose of deciding upon points of the Christian faith; and for its Markets, Mosques, Baths, Colleges, Almshouses, and Manufactories of coloured earthenware, such as is used in Róm. (Europe.) "The beautiful and ivy-mantled walls which enclose," says Major Keppel, (ii. 164.) "all that now remains of the ancient Nicæa," are still in a good condition, though the scanty population of the city has been greatly reduced by the large levies lately made; and he seems to have seen nothing in it but "tenantless streets." "This city," says Lechevalier, (*Voy.* p. 36.) "which in the XIIIth century was considered as the rival of Constantinople, is now reduced to a wretched village, extremely unhealthy, and filled with ruins." "Skirting the sands of the lake," (Ascanius,) says Mr. Dallaway, (p. 164.) "for two miles, appear the massive walls of the ancient Nicæa. They are constructed of thin brick and courses of marble, having frequent towers, many of which form an imperfect square, open on the inside. Some are dismantled, but not in such a degree as that their continued outline and inclosure should be destroyed. Near the North gate are many yards of the original wall of hewn marble; the adjoining towers are more large and lofty, which formed the citadel. Three of the ancient triumphal gates have been incorporated into the present walls, which are seemingly of impregnable thickness. The area, of irregular shape, approaching to a square, exceeds three miles in circuit. Modern Izník," continues the same traveller, (p. 169.) "is a wretched village of long lanes and mud walls, with spacious ruins of Greek Churches, and even of Mosques and Baths of Turkish architecture, embosomed in groves of luxuriant cypress. The great Mosque, with its adjoining buildings erected by O'rkhan, exhibits a vast ruin near the village, which occupies the centre of the area, now interspersed with plantations of tobacco and melons." "The traveller," says M. de Hammer, (*Brusa und Olympos*, p. 111.) "seeks for Nicæa in Nicæa itself, and the ruins of the evanescent city within its yet substantial walls. Its atmosphere," he adds, "is always charged with pestilential and feverish vapours from the adjoining morasses." Preceding travellers, he justly observes, (p. 112.) have looked in vain in the ruins of the Christian churches for the place where the Council met, none of them being large enough to admit such an assembly; (Rennell, *Western Asia*, ii. 108.) but he removes the difficulty by referring to the Turkish Historians, who expressly state that the Mosque of O'rkhan was the great church in which that memorable Council assembled. An ancient aqueduct from the foot of the hills on the East side of the city to the Constantinople gate, and a rudely sculptured sepulchre, apparently of great antiquity, with a nearly obliterated inscription, are the only remaining monuments which he mentions. The inscription on that remarkable sepulchre, which M. de Hammer improperly calls a sarcophagus, is supposed by Pococke (ii. 23. § 165.) to be Hebrew, and by Hammer (p. 122.) to be Phœnician; but to judge from the plates given by each of these travellers, it

agrees in (Pococke, pl. lx. Hammer, tab. ii.) style with the tombs discovered by Mr. Cockerell near Finiká, (Walpole, ii. 524. pl. No. 1.) and the characters may therefore belong to the ancient Lydian or Mysian alphabet. The lake (anciently Ascanias) which washes the Western side of the city, is about twenty miles long and six miles broad, and has abundance of fish, but its water is strongly impregnated with nitre, (nitrate of potass,) and therefore not drinkable; however, beside that brought by the aqueduct, there is a copious source of excellent water (Bey-bunári) near the Eastern gate. Among the remarkable objects in the neighbourhood of Izník is a fine Grotto, or natural perforation of the rock, called Delikli-tásh, (*i. e.* perforated rock,) at a small elevation about a mile from the Bey-bunári, on the road to Iznikmíd; and in the plain a little further on, is the triangular Obelisk, erected as a monument of Titus Cassius Philiscus, son of Titus Cassius Asclepiodotus, whose wealth, disinterestedness, and integrity are recorded by Tacitus. (*Ann.* xvi. 33.) The Tomb, Convent, (tekkeh,) and Mosque of Eshref-zádeh in Izník is much visited by Musulmáns as a place of pilgrimage. Izník is in 40° 21' 30" North and 29° 43' East. (Rennell, *West. Asia*, i. 242, and Map.) Sabánjah, (Sophon, or Latea,) on a small lake, one day's journey to the South-East of Iznikmíd, is a market town without walls, adorned with Baths, Mosques, and other public buildings, and a great thoroughfare. It is situated in a fertile plain, not far from the skirts of the vast forest called the Ocean of Trees, (Agháj denizi,) which extends nearly to Bólí, a distance of sixty miles. The Lake of Sabánjah, says the *Jihán numá*, (p. 666.) is fifteen miles long. The road to Bólí passes for half a mile through the edge of it, and it is half a day's journey from the Gulf of Iznikmíd; and one-third of that distance to the West of the river Sakáriyah. Pliny the Younger proposed to Trajan, and, in the last century, the Turkish Government undertook to connect this lake by canals with the Gulf of Nicomedia and the River Sakáriyah, (Sangarius,) and thus to open a communication between the Black Sea and the Archipelago, independently of the dangerous Canal of Constantinople; but the fears of Trajan and the supineness of the Turks prevented the project from being realized. Karah-Mursal, (Pronectus, according to Rennell,) at the extremity of an angle of the Gulf of Iznikmíd, is celebrated for its pomegranates. Yalák-ábád, midway on the Southern shore of the same gulf, has a medicinal aperient spring which is much frequented in August and is often salutary. It was first called Yáli óvah. (Beach-plain.) Shílah on the Black Sea, thirty miles from the Fenár, (the Asiatic light-house at the mouth of the Canal,) whence Constantinople is furnished with wood, Kirpeh, (Calpe,) 100 miles from the same place, on a point of land at the extremity of a small port, and Kefkeh, or Kefken, another small adjoining harbour, are the only places of note on the Northern shore of this division of Natolia. Kándirí is two days' journey East of Uskudár, on a small stream running into the Black Sea, near Aghveh, or Aghreh. It lies about midway between Iznikmíd and the Black Sea. Semendereh is three hours (leagues) East of Uskudár, and one (three miles) West of Mount Aídós; it had anciently a castle which was conquered, and garrisoned by the 'Osmánlís as long as such defences were necessary. From a cavern near the summit of that lofty mountain there issues a stream of clear water which is said to have poisoned all the cattle of a neigh-

NA-TOLIA. bouring village. On this mountain there was formerly a castle. Kádí Kóí, anciently called Chalcedon, is about two miles South-East of Scútari, (τὸ Σκούταρι, whence the Turkish Uskudár, anciently Chrysopolis.) The latter is a Peculiar attached to the Imperial domains (Khássi Humáyún) and not included in the Sanják of Kójah ílí. It is the great thoroughfare from Constantinople Eastwards, and is adorned with many public buildings erected by different Turkish Emperors their children and Grantees. The delightful hills, called the Old and New Chámlúkeh, (Pine-grove,) two hours (leagues) East of Scútari, have been adorned with country-houses and public walks by various Sultáns, and the neighbouring mountain named Bulghúrlú, (properly *búrghúllú*, wheat-hill,) 787 feet above the sea, commands a magnificent view of Constantinople and the surrounding country. Bey-kóz is a small town and Kádílik on the Asiatic shore of the Canal, (Bosporus,) rather more than halfway between Scútari and the Anátólí Kavák; it is properly a part of the Kádílik of Yavrós. Above the point called Servbúrúní, (Cape Cypress,) between Beykóz and Kavák, there is a very elevated hilly tract, 610 feet above the sea, covered with a thick forest which is believed by the common people to have been the abode of the Prophet Yúsha', (Joshua,) where he instructed his disciples. Near its summit there is a delightful spring, and the Canal of Constantinople, winding along like a serpent below, presents a most beautiful spectacle. (*Jihán numá*, p. 665.) This is the Yúsha' tághí, or Mountain of Joshua, called by the Franks the Giant's hill. The grave of gigantic dimensions on its summit, is probably, as Lechevalier supposes, (i. 74.) the Tomb of Amycus, and was anciently called the Bed of Hercules; (Dionysius Byzantinus, quoted by Gyllius de Bosporo, iii. 6. p. 311.) but the Turkish name, which Lechevalier has not recognised in that of "la Batterie d'Youcha," does not signify Giant's hill as he supposes, and M. Andréossy (106.) positively affirms. Máldepeh (Money-hill) extending from one day's march to the East of Scútari, as far as Túzláh on the Northern shore of the Gulf of Iznikmíd, forms the declivity on one side of that gulf. "Some avaricious persons," says the *Jihán numá*, (p. 665.) "deceived by its name, have made excavations in various parts of it, in the vain hope of finding a treasure." From 'Alem-tághí, (Signal-hill,) a mountain directly East of Constantinople, and one or two hours (leagues) North of Máldepeh, most of the timber used at Scútari is brought in waggons (*'arabah*.)

2. The Sanják of Khudávendikár is bounded by Kútáhiyeh on the East; by Maghnísá on the South; by Karahsá, the Gulf of Mudániyeh and Kójah ílí on the West; and by the latter and Bóli on the North. Its Kádíliks (or Kazás) are these: Ebegí; Ermení; Etrehnós, or Edrenós; Akyází; Akyází yúrek; Ulúbád; Áidin-jik; I'lijeh; Aínehgól; Bákir; Berghamah; Burúsah; Begbázári; Bóyálú; Baíránich; Terháláh, or Sómá; Khermenjik; Sivrí hisár; Sugút; Sinján; Sári cháír; Tágh ardí; Tiráklí; Yeníjeh-sí; Túmáníj; Kári bá-zári; Kórí bázári; Karah Hisár na'l-lú; Kiziljeh Túzláh; Kebúd; Keteh; Girmástí; Gúmish-ábád; Gemlík; Gók-cheh tágh; Gún bázári; Gevínek; Gún-yúzi; Lefkeh; Máníyás; Mermereh and Shámí; Mudániyeh; Míkhálíj; Míkhálíj. The dependencies of Berghamah; Yár hisár; Yení-shehr, and Gól-bázári which is near Lefkeh.

Bousah, or Bursah, Burúsah, (the ancient Prusa,) situated in a rich and beautiful plain at the Northern foot of Mount Olympus,

was the residence and burial-place of the first six Sultáns of the House of 'Osmán. It is still one of the finest cities in the Empire, and, independently of its beautiful site in a rich plain through which the Nílúfer* (or River of Dascylium) winds, it is remarkable on account of its celebrated silk manufactory, its warm sulphureous baths, and its many splendid monuments of Mohammedan piety in the Colleges, Almshouses, Mosques, and Mausoleums, erected by the first Emperors. It stands in 40° 9' 30" North and 29° 4' 45" East. (Rennell, *West. Asia*, i. 245. Browne in Walpole, ii. 111.) The population, in 1802, was said to be 60,000, and five-sixths of it Musulmán. Olympus, called the Mysian to distinguish it from that which separates Thessaly from Macedonia, extends in the form of a crescent from West to East three days' journey between the Rhyndacus and Sangarius which descend from the higher and central chains of Taurus. That part of the range of Olympus which rises immediately above Burúsah is called by the Turks Keshish tághí, (Monk-mountain,) from the highest of the two peaks into which the summit is split. In the interval between them there are still the remains of a Convent, of great celebrity under the Byzantine Emperors, and from its inhabitants, the Turks called the highest peak Keshish, i. e. the Monk. (Hammer, p. 83.) To the South-East, the parallel and converging ranges follow in rapid succession, and the high ridges of Túmáníj form a natural separation between the plains of Aíneh-gól and Sultán Oní, and the Sanjaks of Khudávendikár and Kútáhiyeh. The highest ridges of Olympus have been estimated at 12,000 feet above the level of the sea, but their elevation does not appear to have ever been accurately measured. Beyond the low ridge which separates the plain of Burúsah from the sea, at the Eastern extremity of the Gulf of Mudániyah, (Sinus Artacenus,) is Kemlik, or Gemlik, the Kíos of the Greeks ancient and modern. At about two-thirds of the distance from Kemlik to Tiriliyá búrun, (Cape Trilia,) the South-Western extremity of the gulf, and three leagues from it, is Mudániyeh, (Myrlæa, or Apamea,) the landing-place for vessels from Constantinople, famous for its figs and grapes. Its modern name, spelt Muntaniá (*Μουντανία*) by the Greeks, may, possibly, be derived from the Italian Montagna, and have been given to it by a Genoese colony. About ten miles to the West of Mudániyah is the mouth of the Nílúfer, a beautiful stream, which derives its poetical name (Water-lily, *Nymphaea lotus*), from the favourite wife of O'rkhán, who built a bridge over it. At nearly the same distance from Daskéli, (Dascylium,) at the mouth of the Nílúfer, a large stream enters the Propontis called Míkhálíchah súí, or the river of Míkhálitzí, the ancient Rhyndacus, now deriving its name from Míkhálíj, (*Μιχαλίζι*), a town just below its junction with the river of Sú-sighirlik, (Macestus,) a great thoroughfare between Constan-

* The variations in our best Maps respecting the course of this river, which has been seen by so many travellers, distinctly prove how little reliance even those Maps can claim. Kauffer places its source a little way to the South-West of Burúsah, Lechevalier at a great distance to the South. All, with the exception of M. de Hammer, place its embouchure near Daskéli; he, following the *Jihán numá*, carries it to the Rhyndacus; Major Rennell represents a morass near its mouth, but Colonel Leake and the "Society's" Map, copying him, place between those two rivers the Lake Dascylitis, eight miles long and six broad, which was not seen by Hammer or Lechevalier from the heights of Olympus. The same authorities have expunged the Lake of Bighá seen by Chishull.

tinople and Smyrna. It is, according to the *Jihán numá*, (p. 659.) forty miles from the sea, and about six North-West of U'lúbád. (Lopadium.) That place is the chief town of a Kádílik one day's journey to the South of Burúsah, near the Western extremity of a lake named from it, and also called A'yándún (Abólóniyándún, from 'Απολλωνιατών?) by the Turks, and Apolloniatis by the Greeks. It is about 100 miles in circumference, (Meletius, ii. 3. tom. iii. p. 126.) and contains two large and five small islands. At the extremity where the Rhyndacus issues from it, is Lopadium, formerly a city, where there is a large bridge; and below Lopadium is Michalicium, mentioned above. At the other, or South-Eastern extremity of the lake, is Apolloniada, (anciently Apollonias,) on the Rhyndacus, once an Episcopal See. The River of Girmástí, (Macestus,) according to the *Jihán numá*, (*ibid.*) runs into the Rhyndacus between U'lúbád and Míkhálíj.* This lake is supposed by Colonel Leake to be the Artynia of Pliny. (v. 40. tom. ii. p. 507.) Edrenós, (Hadriani thermæ,) on Mount Olympus, near the Lake of U'lúbád, and one day's journey from Brúsah; Lefkeh, (Leucæ,) on the Gallus, which runs into the Sakáriyah nearly opposite to Geíveh, erroneously spelt Kiwa, a great thoroughfare on the road to Eskí-shehr; Tiráklí, (Tottæum,) beyond that river; Góínek, not far from the source of the Filiyás, (Billæus,) and Mó-drení, (Modrenæ,) on that river, are among the North-Eastern Kádíliks of this Sanják: and returning Westwards, we come to Sugút, (or Sugúd,) a considerable town on the road from Izník to Eskí-shehr. (Dorylæum.) Its name Sugúd signifies a pasture, and its neighbourhood was assigned as such by 'Aláu-d-dín, Sultán of Kóniyah, to Ertoghrul, who had aided him in subduing his enemies. (Hammer, *Gesch.* i. 43.) The neighbouring mountains of Túmáníj and Ermení were allotted for the Summer abode of Ertoghrul's flocks and herds. His son 'Osmán, who may be considered as the first Turkish Emperor, died at Sugúd, but was buried† at Burúsah. (Hammer, *Ibid.* p. 77.) These latter Kádíliks are also assigned by the *Jihán numá* to the Sanják of Sultán O'ní, and, as the boundaries of those districts are often changed, such errors cannot easily be avoided. Sinján, to the South of the Lake of U'lúbád, West of Edrenós, and Mániyás, supposed by Colonel Leake to be Miletropolis, not far South of a considerable lake, lie on the confines of Karah-sí. Tárhálah, two days' journey South of Báli-kesrí, is another Kádílik belonging to Khudávendkár, which here following the valley between Mounts Temnus and Pindasus, and the hills behind Pergamum, separates Karah-sí from Sár-ú-khán and Sigliah. Sómah on the River Caicus, a populous town in the neighbourhood of Tarhálah, is the place where the Kádí of that district resides. It is more than two days' journey North of Berghameh, (Pergamum,) a large town with many Mosques, Baths, &c. built at the foot of a mountain, with a large and

strong castle on a hill difficult of access, lying to the West. It is at the extremity of a very extensive and fertile plain. One ward of this town is called "Neither heaven nor earth," being built upon an ancient aqueduct, which is hollow below. Berghameh is five hours (leagues) distant from the sea, and its ports are Ayázmend and Chándarlí, but it is nearest to the latter. "The site of this celebrated place," says Major Rennell, (i. 374.) "cannot be mistaken. The different branches of the Caicus river, from the Northern and Eastern quarters, unite in the vicinity of this city, and gain the sea at the distance of about fifteen miles to the South-West at Yalea, (Yálí, i. e. the sea-shore?) the ancient Elæa." Two of these streams unite to the East or above the city, and one to the West below it: the two first are the River of Jelembeh, or Gelembeh, (the Caicus,) and that of Báli-kesrí, (the Mysius,) which united form the Selinus of Pliny. (v. 33. tom. ii. p. 478.) The third is his Cetius, (Κήτειος,) for he says, *Longe clarissimum Asiæ Pergamum, quod intermeat Selinus, profluit Cetius profusus Pindaso monte.*

3. Bighá, also called Páshá sanjághí, (i. e. the Captain 3. Biga. Páshá's Sanják, being the second Sanják under his government,) is bounded on the West and South by the Sea of Marmora, (Bahri Mermereh,) and on the North and East by Karah-sí, according to the *Jihán numá*: (p. 667.) it extends, therefore, very little beyond the limits of the peninsula between Adramyttium and Cyzicus, which formed the Troad (Troas) of the Ancients, and was bounded on the West by the highest ridges of Ida. Its Kádíliks are Aíneh-bázári, or Azíneh; (Athenæ?) Báliyah; Bighá; Chák, or Cháng; Káz-tághí; (Ida,) the Castle of Sultánniyyeh; Gógerjinlik; Lápsakí; (Lamp-sacus;) Kapú tághí, (Cyzicus;) Mermereh. (Marmora.) Bighá, (the ancient Pegæ,) Capital of this Sanják, is on the borders of a lake, supposed by Major Rennell (i. 364.) to be the ancient Aphnitis, through which the River Bighá (Bíghásúí, the ancient Tarsius*) flows, and falls into the Sea of Marmora, a little to the West of the isthmus which now joins Kapú tághí, formerly the Island of Cyzicus, to the continent. That peninsula is called by the Turks, according to Kauffer, Ardek Atá sí, (the Island of Ardek,) but Kapú tághí, (Gate-mountain,) according to the *Jihán numá*; and on the isthmus joining it to the continent is Aídinjik, built on the site of Cyzicus. The ruins of the Temple of Cybele on Mount Dindymus were naturally enough called by the Musulmáns the Palace of Belkís, Queen of Sheba, whom they believe to have been one of the consorts of Solomon. It was while contemplating these ruins by moonlight, (Aídinjik,†) that Suleímán Páshá, according to the Turkish Historians, (Hammer, *Gesch.* i. 143.) saw a brilliant stream issuing from that luminary unite the two continents together; voices were also heard from Heaven, encouraging him to carry the 'Osmánlú arms across the narrow sea which separated him from Europe.

* Mikhalitza is placed below the confluence in Major Rennell's and Colonel Leake's Maps, but there is great uncertainty and confusion about the topography of all this tract, though the high roads through it are so well known. Míkhálíchah, or Mikhalitza, by some unaccountable blunder, is called Maalhouc in Poinson's Map.

† Colonel Leake, therefore, was misinformed: (Walpole, *Memoirs*, ii. 203.) A'li 'Osmán, which he, or perhaps his interpreter, supposed to be the name of one man, signifies the House of 'Osmán: the union of two names, as A'li and 'Osmán, is unusual. Ertoghrul, 'Osmán's father, was buried at Lefkeh. (*Jihán numá*, p. 652.)

* The Tarsius is now called Tarzah, according to Chishull; but Colonel Leake either converts the Lake of Bighá into the Miletopolis, or omits it entirely; his Map seems quite irreconcilable with that of Kauffer, and with the data furnished by Stephanus Byzantinus, Strabo, and Pliny. Rennell (i. 364.) makes Bighá, Zeléa.

† "Little moonlight," according to M. de Hammer; but Meninski does not authorize that sense; however, as *aídinjik* is the diminutive of *aídin*, "brilliance," it may signify the brightness of the Moon, which is inferior to that of the Sun.

Abydus.

The vision was immediately obeyed, and on that very night some of his adventurous companions crossed the Hellespont, in order to discover the most advantageous landing-place. To the West of the isthmus, at a small distance, is the mouth of the Tarzah, or Bîghâ River, near which is a village called Sâlisdereh.* About eight miles further Westwards is the mouth of the Chatâldereh sîi, (Fork-dale River,) the ancient Æsepus, which is supposed to rise from the highest ridges of Ida; it flows first Eastwards, but subsequently takes a wide sweep to the North-West as it approaches the Sea of Marmora. There is a bridge over it, at Gógerjinlik, (Dovecot,) about sixty miles West of Mîkhâlij. Six or seven miles in the same direction is the U'stvôlah. (Granicus.) Near its confluence with another stream, and at the distance of three leagues from the sea, is Dimitókah, (Didymótichos,) not very far to the South-East of Cape Karah-bûrun, (Black Nose,) the ancient Priapus, separated from Camâres, (i. e. Arches,) on the site of Parium by Mount Pityodes and the Adrasteian Plain. About thirty miles Southward along the Eastern shore of the Hellespont, beyond the River Pæsus of the Ancients, is Chárták, (Four Arches,) opposite to Gallipoli on the European shore; and six miles North of Lápsakí. (Lampsacus.) The latter place, which still retains its ancient name, lies, according to Meletius, (ii. 4. tom. iii. p. 131.) between Parium and Abydus, twenty-one miles distant from the former, and 170 stadia (twenty-one miles and a quarter) from the latter; therefore nearly half way: about five miles West of the mouth of the River Prosactus, or Practus, and almost fifty miles West of the Granicus. The strait between it and Gallipoli is eight miles across. It is described by Spon, (i. 126.) who saw it 150 years ago, as a small town chiefly inhabited by Turks. Its fine vineyards, some Greek inscriptions, and a few traces of the ancient wall, a Mosque, once a Christian Church, and seven or eight columns on the site of another Church, were the only monuments of its former celebrity which he saw: but when visited by Dr. Hunt and Professor Carlyle in 1801, "not one ruin or vestige of ancient buildings" was discoverable. (Walpole, *Mem.* i. 91.) Its population then amounted to 550 families, (about 2750 souls.) The surrounding country, as almost every where on the shores of the Dardanelles, presents "a continual succession of the richest scenery." Lampsacus, under the Christian Emperors, was an Archiepiscopal See. Beyond Bûrgház, (Pyrgos,) at Ganjerlí, there are the remains of fortifications; and this is perhaps the place called Abarni by Meletius, (*Ibid.*) near Yá-púndakí, on the River Rhodius. The ancient Abydus is supposed to have stood on the point now called Nárlí búrun, about a mile to the North of Chanák kal'eh-sí, (Dish Castle,) the fortress near the modern town of the Dardanelles. It is about twenty miles from Lampsacus, as mentioned by Strabo. (xiii. l. 18. p. 589.) The Royal Castle (Kal'ehi Sultániyyeh) was, in

* "At the mouth of the Tarza, (in the Propontis,)" says Major Rennell, (i. 366.) "is a place named Salis-dere, meaning either Salis valley, (or river,) and which may be the remains of the name Zeleia." That able writer was too often, like D'Anville, misled by accidental resemblances. Sâlis, which rests on no better authority than Kauffer, who spells Nicée in the Turkish character, as if it were the vernacular name of Nicæa, is far from the site of Zeleia, and dereh, though similar in meaning to the Arabic word wâdî, is never used by the Turks for a stream or torrent, though it signifies the ravine or valley through which the stream flows.

1801, garrisoned by a few gunners, (tópjis,) and the guns of the great battery, placed on a level with the water, had a bore three feet in diameter, and were charged with marble shot from the columns at Eski Stânból (i. e. Old Constantinople, or Alexandria Troas.) These gigantic guns were worked by pullies and levers. The population of the town amounted then to about 10,000 persons, one-fifth Jews, and the rest Musulmâns with a very few Greeks. The remainder of this Sanjâk forms the ancient Troad, of which a more detailed account will be given in a subsequent volume of this Work.

4. Karah-sí, the adjoining Sanjâk, is bounded on the North and East by Khudâvendikâr; on the South by Maghnísá; and on the West by the White Sea and the Sanjâk of Bîghâ. It contains the following Kádîlíks: Edremíd; Ayázmend; Eyúrendí; Bálikésrí; Básh-Gelembé; Bîghádîj; Sandaraghí; Fert, with Shámli; Feslegán, with Kózák; Karajah-lar; Kemerí Edremíd. Bálikésrí, the Capital of this Sanjâk, is four days' journey South of Brúsah, and has a market on Tuesdays. Its name appears to have had a Greek origin, and may possibly be derived from Palæo-Cæsarea. It is perhaps the Hiero-Cæsarea, celebrated on account of its Temple of Diana, (Tac. *Ann.* iii. 62.) and under the Christian Emperors, was an Episcopal See, (Car. a S. Paulo, *Geograph. Sacra*; Banduri *Antiq. Constant.* i. 237.) subject to the Archbishop of Sardes. Being situated to the West of Thyatira, on the confines of Lydia, Æolis, and Mysia, it has been assigned by different writers to each of those Provinces. It was given up to O'rkhán by the sons of 'Ajlán Bey, the last of its Seljúkian Sovereigns, in A. D. 1337. Mr. Browne found it, in 1802, a considerable town, much frequented at the period of its yearly fair, beginning on the 10th of Safar, (the second month in the Mohammedan year.) It is surrounded by a fertile but ill-cultivated plain, and separated by a low chain of hills from the high road between Smyrna and Constantinople, from one part of which it is not two miles distant. (Walpole, *Mem.* ii. 143.) It stands in 39° 32' North and 28° 3' East. Bákir,* with its district, in the neighbourhood of Berg-hameh, (Pergamus,) lies to the South of Bálikésrí, at the foot of a mountain from which Zaghún Páshá brought some excellent water to the town, which has a public walk at the source of that stream, and was adorned with an Oratory, Mosque, and other pious foundations, by Sheikh Lutfu-llah Baírámi, who is buried there. Its stream joins that flowing by Gelembé, and is probably the Caícus of the Ancients, (Rennell, i. 375.) into which the River of Bálikésrí (Mysius) falls lower down. At Mandahúriyâ, or Mandakhóriyâ, (Mavðpaxwplâ, Mandra-choria,) a large village in a plain near a considerable stream, (the River of Bálikésrí,) crossed by a stone bridge, there are two Kháns; one of them at least was standing when Van Egmont passed through the place in the early part of the last century. (*Trav.* i. 135.) He notices the beauty of the valley, its proximity to Bálikésrí, and the river which flows through it: the hills are here in parallel chains, running nearly from East to West. Tournefort (ii.

487.) calls this place Mandragoia, and mentions the fragments of ancient marbles scattered about and the columns used in building the Khán where he lodged. He justly condemns Spon for supposing the river which runs at a short distance to the South of this place, to be the Granicus, and agrees with Colonel Leake in taking it for the Caicus: he also names it *Fourtissar*.^{*} Mandahóriyá is, according to the *Jihán numá*, (*Speculum mundi*), three days' journey from Míkhálj. Sú-sighir-lú-kói, (Water-ox, i. e. Buffalo-village,) on a river called Sú-sighir-lí-súí, twelve hours to the North of Mandrakhoría, is on or near the site of some ancient town, as the marbles scattered about it show. (Tournefort, ii. 487.) He, in common with Spon and Wheeler, strangely took the river passing by it, which joins the Rhyndacus above Múkhálj, for the Granicus. Bighádij is a market-town (*kasbah*) near the Kádílik of Gúrdús (Juliogordus) and Demirjé. Sandaraghí is a Kádílik comprehending from fifty to sixty villages, taken from Bighádij, and the Súbáshí of this Sanjak resides in Kází bázárí kói, three hours (nine miles) East of Bighádij. Eyúrendí is a town (*kasbah*) to the West of Báli-kesrí, to the South of which there are ruins. (Kemer.) Básh-Gelembé is a large village, in a valley surrounded by hills, five days' journey from Míkhálj. There are twenty villages in its vicinity; and it has two Kháns, an excellent market, two large Mosques, (*jámí*), and a small stream flowing in front of it. One side of this valley is the boundary of Karah-sí; the other that of Sárú-khán. Básh Kelambé is described by Tournefort (ii. 489.) as a pretty little town (*bourgade*) in a well-cultivated place, about six hours (eighteen miles) from Mandrakhoría, from which it is separated by a low chain of hills and two small streams. (*Ruisseaux*.) It carries on, he adds, a large trade in cotton. This valley is separated by a very flat ridge from the great plain of Balámút, through which the Hyllus flows. Gelembé (Yelembeh, or Jelembeh, as the name is occasionally pronounced) is about nine hours North-East of Akhisár, (Thyatira,) and the valley in which it is situated was in Van Egmont's time (early in the last century) truly charming, "the very eminences were improved into fields or orchards." (i. 183.) Ayázmend is a town (*kasbah*) about six miles from the sea-shore,† one day's journey South of Edremíd, on or near the site of Attalia. About ten miles North-West of it, and nearly opposite to the Moskhonnisiá, (*τὰ Μοσχοννησία*), is Aivá-lí, (Quince-town,) in Greek Kydhoniés, (*Κυδωνιές*, or *Κυδωνιές*), a populous village, chiefly inhabited by wealthy and public-spirited Greeks, who, before the late troubles, had established a School or College there, where the ancient Languages and other branches of knowledge were taught with great success. Nearly at the same distance to the North-East is Kemer Edremíd, (i. e. the Ruins of Adramyttium,) at the extremity of the gulf, about five miles South-West of Adramyttium, (*Ἀδραμύττιον*, pronounced Adhramytti,) the intervening part of the gulf and former harbour having been doubtless filled up by alluvion. (Rennell, i. 303. 371.) These places, though on so celebrated a spot, the site of a great Em-

* Major Rennell (i. 375.) takes it for the Mysius, and the stream from Gelembé for the Caicus: their relative size and the course of the valleys would probably determine the question.

† Ayázmend appears to be the Ayiasmáti (*Ἀγιασματί*) of the Greeks; where Dallaway (*Const.* p. 308.) seems to have had no leisure to notice any thing except his hospitable reception at the Aghá's chiflílik.

porium, and an Episcopal See under the Metropolitan of Ephesus, have been scarcely noticed by any modern travellers.

5. Sárú-Khán is bounded on the West by Sighlah; on the North by Khudávendikár; on the East by Kútá-hiyeh; and on the South by Aídín; and it corresponds with a part of the ancient Ionia and Lydia. Its Sanjaks are, Atalah; Ak-hísar; I'ljeh Perágendeh; Perágendehi sálhá; Búrlú; Bengí; Terkhániyát; Túrgúdlú; Kójahlar; Kayájik; Gúrdúk; Gúrdús; Gúzel-hísar; Mermerehjik; Demirjé, or Mukáta'át; Maghnísá; Mendakhóriyah. Maghnísá, (Magnesia,) the Capital of this Sanjak, was long a favourite residence of Princes of the House of 'Osmán. It is a large city, says the *Jihán numá*, (p. 535.) at the foot of a mountain, (Sipy-lus,) and at the extremity of an extensive plain, (that of the Hermus.) A naked rock, forming a part of that snow-capt mountain, overhangs the city, and is crowned by a castle built by the unbelievers. (Káfirs.) The River of Kudús (Kudús Súí, the Hermus) flows through the plain before it, at two hours (leagues) distance, and is crossed by a wooden bridge. Its Bezestán, Baths, Mosques, especially the Murádiyyeh, Khátúniyyeh, and Sultan-jam'í, are deserving of notice. It has also many other public buildings, such as Convents, Colleges, Schools, Almshouses, and Kháns, which are pious foundations. On a very high hill, called Súsén diráz, South-West of the city, there are ancient remains. The purity of the air and fertility of the plain make this a desirable residence, and in A. H. 994 (A. D. 1586) Sultán Mohammed took his abode on this mountain instead of going up to the Summer quarters (*yaílák*) in the Bóz tágh. (Icy Mountain, i. e. Tmolus.) It has abundance of gardens and vineyards, and the plain is celebrated for the beauty of its tulips, the seed of which is purchased by amateurs (*tálibler*) at a high price. On the North-East side of the Palace of the Princes, there is a spacious place, into which the Palace opens. As the air of the town is unhealthy in Summer, the inhabitants repair to their Summer-quarters in the mountains above. Magnesia stands in 38° 42' North and 27° 20' East, (Leake,) and its citadel and Palaces were already falling into ruin when Tournefort passed through it in 1701. (*Voy.* ii. 490.) Sipy-lus, he adds, is greatly inferior to Olympus, as Maghnísá is to Brú-sah, but the Hermus, which appeared to him much larger than the Granicus, (he probably means the Níl-úfer, or Horisius, which flows near Brú-sah,) is a great ornament to the whole country. It receives two other streams, one from the North, (the Hyllus,) and another from the East, and crossing the plain in a South-West direction, makes a great elbow before it reaches the bridge, whence it runs in a Westerly direction to the Gulf of Smyrna, which it enters nearly opposite to the Castle at Sanjak búrnú. It forms large sand-banks near its mouth. The plain is sandy, and a great part of it is covered with tamarisks; but its fertility, which is almost proverbial, is symbolically expressed on a coin of Domitian. Sipy-lus is still covered, as when Tournefort saw it, with Andrachnes and the common Arbutus; and the fragrant Sipy-læan marjoram, (*Origanum Sipy-læum*), which is so often seen in our green-houses, adorns not only the declivities of Sipy-lus, but those of all the neighbouring mountains. Cotton is also still the staple article of produce in the plain. The population may be estimated, according to Major Keppel, (ii. 294.) at 15,000, the greater part Turks; so much so, that here the Greeks begin to lose

their own language. "Its present impoverished and almost desolate condition," he adds, "forms a melancholy contrast to its flourishing state under the government of Kará 'Osmán O'ghlú. The family of that Chief, who held a large portion of the country between Smyrna and Constantinople as hereditary fiefs, were remarkable for their attachment to each other, their fidelity to the Porte, and the excellent order maintained throughout their territories. No where was the government more equitable, nor was there any part of Turkey so prosperous as the districts belonging to these Dereh Beys, as the principal members of the family were styled. By good management, and doubtless by bribes to the leading members of the Díván, they were left for nearly a century unmolested by the presence of a Páshá, in the undisturbed exercise of those powers which they employed so much to the advantage of the Sultán and his subjects. But a jealousy, probably of their popularity, and a vain hope of exacting more than they could undertake to realize, led the present Sultán to dispossess them of their authority and place Maghnísá under the command of a Páshá, since which time the ruin of the place has been nearly completed. Maghnísá is six leagues North-East of Izmir, (Smyrna,) four leagues East North-East of Menemen, (Temnus,) four leagues North by West of Níf. (Nymphæum.) Túrghúdlí (i. e. Stoppage, Detention) is the principal Kádílik after Maghnísá. It is a considerable town about half-way between Maghnísá and Sárt, (Sardes,) in a low, well-watered position surrounded by gardens celebrated for their delicious melons. It is commonly known by the name of Kasabah, (i. e. Market Town.) Akhisár, (White Castle, the ancient Tyatira,) two days' journey North-East of Maghnísá, has a few Mosques, two Baths, and a ruined Castle. In Summer-time its air is unhealthy. It is contiguous to the Kádílik of Sandaraghí, and lies East by North of Gúrdús, (Juliogordus,*) which together with it and Balámút forms a triangle. The road from Balámút to Maghnísá passes between Gúrdús and Akhisár. Balámút is a Kádílik to the South-West of Básh Gelembé, comprehending a few villages. The town is at the foot of a hill South-West of Akhisár, East of Maghnísá, and North-East of Gúrdús. Mermerá, between Akhisár and Bóz-tágh, (Tmolus,) is a market town which has a large Mosque. Its name is evidently derived from Marmora, and it is about a mile to the North-West of a fine lake, the Gygaüs, or Coloë, of the Ancients. Itálah (Attalia) is a Kádílik which has Símáv and Tímúrlí on the East; Aíneh-gól and Aídín on the South; Gúrdús on the West; and Akhisár on the North-West. It is on the Northern bank of the Hermus, as we learn from Major Keppel, (ii. 335.) but he does not appear to have found any vestiges of antiquity there. The Germábeh (Warm Springs) of Sárt are on the road from Maghnísá to Bóz-tágh, one day's journey from the town of Sárt, (Sardes,) and lying to the South-East of Maghnísá. Tímúrlí, also called Demirjé, or Mermerjik, is a Kádílik in the neighbourhood of Sandaraghí; one of its districts is called Karah tásh.† It lies to the West of Símáv, and to the East

of Mendakhóriyá. The town of Demirjé had lately about 5000 inhabitants, and carried on a considerable trade in opium. (Keppel, ii. 266.) "Fóchah (i. e. Phocæa, pronounced Fóchea by most of the Greek sailors) is a town (*kasabah*) on the sea-shore, with a Castle, Mosque, Bath, and Market, surrounded by gardens. Most of its inhabitants are Greek Christians, (Nasarái Rúm,) whomake from its grapes a wine, known among themselves by the name of Karahjah Fóchah wine." This is the Foggia Nova of the Italian seamen, and the Kenúriæs Phókíæs (ἡ Καινούργια Φώκεια, Melet. *Geogr.* tom. iii. p. 159.) of the Modern Greeks. It is placed in 38° 44' North and 26° 42' East by Colonel Leake, and has, according to Meletius, a spacious harbour, being 34 miles North-West of Smyrna. Old Phocæa, the same writer says, was between Smyrna and Cyme, 10 miles from the Hermus, and 20 from New Phocæa. It was once an Episcopal See under the Metropolitan of Smyrna.* Of the remaining Kádíliks in this Sanják, it may be observed that I'ljeh signifies "Warm Springs;" Perágendeh and Perágendeh Sálhá, "Scattered for Years," seem to indicate extensive and ancient ruins, and to allude to the earthquakes so common in this part of Asia: Terkháníyát may refer to exemption from feudal service, to the abundance of the *Artemisia dracunculus*, called Terkhán, or to a Tatar Tribe of that name; Bengí, to the cultivation of hemp or opium. Búrlú means twisted or uncultivated; and as these names are significant, attention to their meaning may furnish a hint as to the peculiarities of the place to which they belong. Every Kádílik, moreover, is a district of some extent, and is named from its principal town, most therefore, if not all, of these places might still be found, notwithstanding the rapid depopulation of the Turkish Empire for the last 100 or 150 years.

6. Of Sighlah, or Sighahjik, belonging to the Government (Iyyálet) of the Kapúdán Páshá, and appropriated to the use of the Arsenal, the Kádíliks have been taken from some other Sanjáks. Its Capital is the very considerable (*en básh*) City of Izmir; and its Kádíliks are: Azíneh; Ayá-solúgh; Izmir; Akcheh-shehr; Aídín, or Súkeh;† Aíneh, or Mut; Báf; Balát; Bairámlú; Cheshmeh; U'rlah;‡ Chíneh; Sefrí-hisár; Sháh-mah; Sáver; Súbíjeh; Tolmah; Kárpúzlú; Karajah Kóyunlú; Karah burún; Kizil-hisár; Kúsh-atah-sí; Mendejeh; Níf; Menomen. Of Izmir, (Smyrna,) the Capital of this Sanják, in 38° 25' 36" North and 27° 6' 45" East, (Captain Beaufort,) the *Jihán numá* (p. 669.) notices the magnitude of the harbour and the two castles, the one on a high hill (about 500 feet above the sea) on its South side; the other on the sea-shore on the North-West side, (nearly in the centre of the North-West side if the suburbs are included.) The remains of its ancient walls, its populousness, and abundance of fruits and vegetables are also mentioned by him. "The town," he adds, "is on the Northern skirt of a low mountain by the sea-shore, having the sea on the

North and West, and a plain with hill and dale covered with vineyards on the East. It contains twenty Wards or Districts, (Mahallát,) ten large Mosques, (jámi'), nine Baths, many Markets; half a ward near the sea is filled with shops and bázárs. It is supplied with water by springs, wells, and a small stream passing from the skirt of the mountain to the East of the town, and when near the sea diverted into various channels which convey it to different places in the town. The houses are built of wood with tiled roofs and face the North and West, having their backs turned to the mountain. The Mosques of Níflí zádeh and Ya'kúb Bey near the sea, have cupolas covered with lead; that of Hájí Husein is also near the sea, and there are several smaller ones in the interior of the town. There are sixty Kháns; one of them, triangular in form and at the mouth of the lower harbour, was built by Sultán Mohammed the Conqueror. It has houses on one side, the sea on the North and West, and a large open place (Meidán) on the South. In the old ruined castle there are ancient remains, forty columns, and a large subterraneous reservoir. Opposite to the gate of the upper castle there is an ancient Greek building called a Theatre, (Tamáshálik,) consisting of steps formed in the side of the hill." Though long the most flourishing sea-port in the Empire, this city has not increased since the time of the above writer in any very great degree. Its population, in 1813, was estimated on a rough calculation as follows: Musulmáns 75,000; Armenians 6000; Greeks 40,000; Jews 12,000; Roman Catholics 5000; Europeans 500; temporary residents 15,000; making a total of 153,500. Upwards of 20,000 were carried off by the Plague in the ensuing year; but it is probable that the general pacification, so beneficial to the trade of the Mediterranean States, has had a favourable effect on the condition of Smyrna; and that its population is now upwards of 150,000 souls, notwithstanding the massacres and emigration of its Greek inhabitants, and the numbers who perished in the war with Russia. Few traces of its ancient splendour are now to be seen. The Warm Baths called I'ljah, on the declivity of Mount Corax, have scarcely a vestige of the buildings which anciently covered them; and the remains of the neighbouring Temple of Apollo, which Chishull mentioned to Tournefort, (ii. 501.) have entirely disappeared. At the ruins called the Baths of Diana, East of the town, little except the clear and copious spring is any longer to be seen. It smokes in Winter, and to the hand, even in mild weather, appears tepid, but its heat, when ascertained by the thermometer, is not higher than the mean temperature of spring-water in that latitude. The enclosure of the ancient Castle on the summit of the hill, its gate ornamented with rude sculptures, a metrical inscription recording its restoration by John Angelus Comnenus in A. D. 1224; the mutilated bust of Apollo encased in the adjoining wall; the site of the Circus or Stadium; a fragment of the entrance to the Theatre, and the ruins of St. Polycarp's Church are almost the only remains of antiquity which can now be found. Not far from the sea, on the opposite side of the plain to the North of the town, beyond the little stream which comes down from the mountains to the North-East, and which was probably the Meles,* there

Æolian
Smyrna.

* There are two streams near Smyrna both of which have been taken for the Meles of the Ancients. One rises a little to the East of the South, and washes the South-East side of Mount Pagus; the other comes from a small lake in the mountains to the North-East,

is the ancient cemetery noticed by Pococke, (book ii. ch. i. § 57.) but few of the tombs can now be discovered except by a very practised eye. This was manifestly near the site of the most ancient the Æolian City which was subdued by Alyattes; a circumstance not noticed by Pococke, who accurately describes the ancient aqueducts crossing a romantic valley called by the Europeans Paradise, and lying at the South-East foot of the Castle-hill. (Mount Pagus.) The commerce of Smyrna on account of its position, nearly midway between the Northern and Southern coasts of Asia Minor, and its excellent harbour, is still very considerable, though, as a very large portion of the productions formerly procured in Turkey are now obtained in greater perfection and at a cheaper rate from the East Indies, the trade with Great Britain and this port has been long on the decline. As a place of residence it is decidedly the most agreeable to an European of any city in Turkey; as its constant intercourse with various parts of Europe furnishes an abundant supply of all essential luxuries; and the intelligence and hospitality of its European inhabitants, give a charm to its society, which is not felt, especially in time of war, even in Constantinople itself; where political jealousies are too often allowed to interrupt the intercourse of individuals, who forget that they are on neutral ground, and vainly imagine that, as a point of honour, they ought to convert national into personal quarrels. Burún-ábád, (commonly called by the Franks Burnabát,) the favourite country residence of the French merchants established at Smyrna, is about eight miles to the North-East on the bank of the Meles, which is now little better than a mountain torrent. This town (*kasabah*) is said by the *Jihán numá* (p. 670.) to have five or six Mosques and three Baths; but if that be not an exaggeration, it must have lost much of its former prosperity. The rapidity, however, with which even the neighbourhood of this large and flourishing sea-port has been depopulated, is strongly illustrated by the fact, that out of ten villages in the District of Burún-ábád marked in the Kádí's list made in A. D. 1780, only five or six were existing thirty years afterwards. "At Bunár-báshí, (Spring-head,) there is an agreeable walk, (*mesireh*), and a copious stream issues from a cavern over which there is a building crowned with a cupola; and at the extremity of the cavern there is a place like a closet-door, within which the people of the Country say there is much treasure; but it is enchanted, (*mutalsim*), and when some persons went to open it, there issued from it a poisonous blast (*bádi sumúm*) which slew them. U'rlah (commonly pronounced Vurlah) is to the South-West of Izmir, twelve miles by sea, and half a day's journey by land.

NA-
TOLIA.Bounar
bashee.Vourlah.
Bryula.

and passes by Búrun-ábád, (called Bonavre by Pococke.) The latter enters the harbour about a mile and a half North of the town, and is the true Meles, as the ancient cemetery on its Northern bank shows, and there is an Inscription in honour of the river still existing in the Mosque of Búrun-ábád. The copy published by Major Rennell, (ii. 14.) taken from the transcripts current among the Smyrniote Greeks, is very incorrect; but at the suggestion of a friend, who observed that it consists of two iambic verses, and suspected some errors of transcription, the stone was carefully examined by Mr. Foster, jun. of Liverpool, in 1813, and is as follows:

ΤΜΝΟ ΜΕΛΗΤΑ ΠΟΤΑΜΟΝ ΟΝ ΣΩΤΗΡΑ ΜΟΥ
ΠΑΝΤΟΣ ΔΕ ΛΟΙΜΟΤ ΚΑΙ ΚΑΚΟΤ ΠΕΠΛΗΜΕΝΟΤ.

"I celebrate by a hymn the River Meles, who hath saved me from all the pestilence and evil which hath now been caused to cease."

NA-
TOLIA.

It is a small town, having one or two Mosques, a Bath, and Markets, and in consequence of the possession of many olive-trees, being a *mine* of soap. It is three miles distant from the port and landing-place, (or Scale, *iskeleh*.) where there is a very neat Rabát (hostel) and a Mosque built A. H. 994. (A. D. 1585.) Opposite to this scale is a small, uninhabited island, anciently united with the continent by a stone pier, portions of which are still discernible. This island is the site of the most ancient city of Clazomenæ, which was subsequently removed to the neighbouring coast, and perhaps placed where the romantic village of Kirizmán, or Kilizmán, now stands, about three or four miles North-West of Vurlah. Menemen (Temnos) is not far from the mouth of the Hermus, on the opposite side of the gulf, and has Gelembah and Túrghúdlú (Kasabah) to the North and East. To the North-West of Vurlah is Karah Burún, (Black Nose, ἡ Μέλαινα ἄκρα,) at the extremity of the peninsula joined to the continent by the isthmus on which Vurlah (anciently Bryula) stands, called the Isthmus of Teos, not seven miles across. The whole peninsula now forms a district bearing the name of the Cape. It consists of one towering and rugged mountain, the Mimas of the Ancients; famous, as of old, for its fertility and the predatory character of its inhabitants. Its black grapes are much esteemed, and raisins made from them form a large part of the exports from Smyrna. It was called by the Ancients εἰθηρον, and the name of one of its valleys Kaplán dereh, (Leopard Vale,) as well as the reports of Leopards seen there, seems to justify the ancient epithet. At its foot, on the Western side, opposite to Scio, is Cheshmeh, (*i. e.* Spring, or Fountain,) a pretty little town at the bottom of one of those deep and land-locked harbours so frequent in the Ægean Sea, where the Russians, in the night of the 13th Rabí 'ul-evvel, (July 17, 1770,) destroyed the Turkish fleet. The town has a small fortress commanded by a Dizdár Aghá, and is fifteen miles from the site of the ancient Erythræ, now, according to Meletius, (*Geogr.* iii. 163.) called Lithry, and under the Christian Emperors an Episcopal See. An isthmus or break in the mountains between that place and Teos separated Mount Mimas from Corycus, and led to the Southern shore of the peninsula where the Castle of Sighlah, or Sighahjik, on the site of Geræ, the port of Teos, still exists, and gives its name to this portion of the Captain Páshá's Government. It is on the North side of the isthmus of a small and rugged peninsula, and not quite four miles North-West of Búdrúm,* the site of Teos; of which the scanty relics are described by Chandler, (*Asia*, p. 98.) and still visited with pleasure by the admirers of Grecian Art. Sefrí-hisár (Yellow Castle, Serví-hisár, or Cypress Castle, in the Maps) and the ruins of Lebedus and Colophon† lead from Sighahjik to the mouth of the Menderez, (Cayster,) and the ruins of Ephesus (Ayá-solúgh, or Ayá-thológh, from the Greek title of St. John the Evangelist, ὁ ἅγιος Θεολόγος,) where the lapse of Ages, and revolutions succeeding revolutions, are presented as it were to the eye, at one glance, by the mouldering, roofless Mosque, which bears the plainest

marks of its having once been dedicated to Christian worship under the invocation of the Saint whose name it bears, and is still adorned by magnificent columns which, doubtless, in early Ages, sustained the far-famed Temple sacred to "the Great Goddess of the Ephesians." The road along shore passes at the foot of Mount Coracium; a winding and very narrow defile in the interior, between that mountain and Gallesus, leads from Túrbeh-lí (Metropolis) to Ephesus. Another defile crossing Mount Corissus, passes on to Kúsh-átá-sí, (Bird Island, Neapolis,) called by the Italians Scala Nova, a town of some magnitude, carrying on a considerable trade with the fertile plains and valleys adjoining. It is about fifteen miles South South-West of Ephesus, on the side of a small bay immediately opposite to Súsám-átá-sí. (Samos.) Between Scala Nova and the Mæander is Mount Messogis, five or six miles from that river, beyond which rises Mount Titanus, a rugged and craggy mass of calcareous rock, as its name, signifying chalk or gypsum, (Chandler, p. 164.) implies. The difficult pass across it extends for about twelve miles to a small plain half encircled by a naked ridge, and watered by a long and narrow lake containing many islets, and communicating by an outlet with the Mæander. On the borders of this lake, at or near Báf, are the ruins of Heraclea under Latmus,* which in Strabo's time (xiv. p. 636.) was on the shore of the gulf. This lake, therefore, was, as Major Rennell observes, (ii. 30.) part of that gulf which has been gradually filled up by alluvial soil brought down by the Mæander. On the North-East side of the gulf, between Sámsún and Kelibesh, was the site of Priene; and on the Southern bank of that river, not far to the West of the outlet from the lake, is Balát, or in the diminutive form Balátchah, (τὰ Παλάτια, the Palaces,) on the site of Miletus. This city, like Ephesus, bears the traces of successive revolutions; beside the remains of a spacious Theatre, walls, frizes, columns, fragments of statues, and inscriptions, the ruins of many deserted Mosques, mark the extent and population of the place long after Paganism had been supplanted by Christianity, and the latter had been almost expelled by the Musulmán arms: one only, "a noble structure of marble," was still used when Chandler saw the place in 1764; and it is probable that even that has now been abandoned. The Turks, though they usually respect their own pious foundations, and never, perhaps, before the present Páshá of Egypt, Mohammed 'Alí, set them the example, laid violent hands upon the funds appropriated for religious uses, do not appear to have thought themselves bound to regard the foundations of the Seljúkian Princes who preceded them, and under those Princes this part of Asia Minor seems at one time to have flourished more than even under the 'Osmánlús themselves. Of the Kádílik in the interior of Sighlah, Akchah-shehr, belonging properly to Aídín, and therefore called Akchah Shehri Aídín, also named Súkeh, is probably the place called Suki by Chandler, (145.) and Sukoi by other travellers. It was much reduced when Chandler saw it, but had still a Mosque and Khán, and was held as an Aghálik by a son-in-law of Iliyás O'ghlú, whose family, for near a century, possessed the same authority over a large tract South of Smyrna, as that of Kará

'Osmán O'ghlú did over the Country North of it, both Chiefs being equally celebrated for the maintenance of tranquillity and good order.

7. The adjoining Sanjak is Aïdín, bounded by Sighlah on the West; by Maghnísá on the North; by Kútáhiyah on the East; and Menteshá on the South. Its Kádílik or Jurisdictions are: Arbáz; A'lá Shehr; A'másáh; O'rtákchí; Ayá sólúgh, (Hagios Theologos,) attached to Sighlah; Añneh gól Aïdín; Báliyán bóli; (Palæopolis;) I'neh; Báindir; Birgí; Bóztaghán; Tíreh; Sart; Sultán hisári; Karahjah koyúnli, or Tíreh pólmah-sí; Kestel, or Názli; Keles; Guzel-hisár; Kóshk, belonging to Yení Shehr; Keler; Kestereh; Bairámlú with Karah koyúnli. 1. Tíreh* is the Capital of Aïdín. Between it and Maghnísá lies the mountain called Kiziljah Músá, and at the foot of another mountain opposite is Tíreh,† (Caystrus?) a commercial town (*bender shehr*) which has a Mosque covered with lead, Baths, and Bázárs; its inhabitants are wealthy merchants. It is remarkable on account of a beautiful Oratory (*Mosallá*) two hundred paces square, entered on each of its four sides by a flight of ten steps, and adorned internally with a jet d'eau surrounded by a green sward of trefoil, (*terfil*), interspersed with trees, and having its Southern side shaded by a grove of cypresses. Van Egmont and Heyman, who are among the few travellers who passed through this town, describe it as situated on the side of a most beautiful valley enclosed by rugged, and for the most part naked mountains, in many places covered with snow late in April. It is about eight hours distant from Gúzel-hisár, on the Mæander, (Tralles,) but as the road is extremely rugged and winding, its distance cannot be estimated at more than eighteen or nineteen miles. It is called Tyria (probably its Greek name) by those travellers, and is a town of considerable size, appearing to them nearly as large as Smyrna, (*Trav.* i. 139.) but much less populous. More than twenty Mosques, a well-supplied Bázár, abundance of shops, and two Greek Churches, one of them adorned at its entrance with a mutilated porphyry image of Christ, were evidences of the then flourishing state of the place. "Its situation," they add, "is extremely agreeable, on the border of a beautiful valley abounding in rich pastures, and in the lower grounds producing much rice. The town is on a small stream, running into the Cayster about five miles to the North. It was supposed by M. De Heidenstam (Rennell, i. 387.) to be Mastaura, but Colonel Leake has marked it as on the site of Caystrus. Báinder, about six miles North-West of Tíreh, is a populous town (*beldeh*) which has Markets, Baths, and a large Mosque (*jámi'*). Cotton is much cultivated around it. It stands on the Southern declivity of Mount Kizil Músá; (Red Moses;) has Tíreh on the South; Birgí on the East; and Ayá sólúgh and Nif on the West. The road to it from Maghnísá passes across the middle of Kizil Músá in a South-Easterly direction. It is on the Northern extremity of the Caystrian plain of the Ancients. "Názli is a pleasant and populous town, surrounded by vineyards for the space of a farsang (two miles and a half) all round, celebrated for its figs. (*Jihán numá*, p. 636.)

* Tíreh is a great distance to the South-West of the site of Tyriæum, for which it was taken by Chandler. (Rennell, ii. 146.)

† It should, perhaps, be written Thíreh, for it appears to be spelt with *th* in the *Jihán numá*, but the common pronunciation of the name both by Greeks and Turks militates against this supposition.

It is situated on a plain between the mountain on which Tíreh stands, and another called Kestel, to the South-East of that place. On the Southern side of that mountain is Yení-shehr, which lies to the South-East of Názli and Sultán hisár." The figs of Názli have not lost their celebrity, and are still considered as the best brought to the Smyrna market, which receives its chief supplies from the plains of the Cayster and Mæander: this is the more remarkable as Strabo (xiii. 630.) speaks of the figs of Antioch, supposed to be on or near the site of Yení-shehr on the Southern side of the Mæander, as peculiarly excellent. "Sultán hisár (King's Castle) has an old ruined castle, and is the head of a Kádílik. It lies on the Southern declivity of the Kestáneh (Chestnut) Mountain, (Messogis, Rennell, i. 389.) which is behind it, and has Kóshk on the West; and Kestel on the South-East between it and Yení-shehr. Báliyán-bóli (Palæopolis?) is parallel with it; and at the foot of the mountain on the other side is Gúzel-hisár." (Tralles.) Chandler only (215.) passed through Názli-bázár, (the Market of Názli,) at some distance to the North of Názli buyúk; (Great Názli;) but it was also visited by Pococke in 1740, who justly inferred from its name that it was near the ancient Nysa, the ruins of which are still to be traced on the skirts of Messogis, (Kizil Músá,) about two miles from Sultán hisár. Kóshk, a market town four hours (leagues) from Gúzel-hisár, has an abundance of gardens and figs. It is called Chiosek,* or Chiauskui, in Chandler's abstract of Picenini's journey, (p. 216.) and said to be only two hours (leagues) distant from Sultán hisár, being nearer to the river than Chandler's route, which passed close upon the edge of the mountains, and carried him (p. 212.) in five hours to the town last named. Gúzel-hisár (Beautiful Castle) is a fortress enclosing a populous city with two wards or streets (*mahalleh*) outside of it. It lies to the East of a large mountain, and its plain being sandy produces little grain but many figs. Azíneh, four hours distant from it, has eight Mosques, with Baths and Markets. The valley of Gúzel-hisár is on the Southern declivity of a hill belonging to the Mountain of Tíreh, (Messogis,) to the East of which is Kóshk, and to the South, on the declivity of the opposite mountain, is O'rtákchí, (Comrade Town,) on an elevated spot on the mountain, above which there is a favourite place of resort called Andez; which lies a little to the West, on crossing the mountain of Tíreh. Bóztaghán is a town in the midst of well-watered meadows, on the Northern declivity of the mountain (Titanus?) through which the defile (*derbend*) of Yení-shehr passes, lying to the East of O'rtákchí, to the West of Arpáz; and four hours to the South of Kóshk. Arbáz (Harpasus) is a Kádílik between Yení-shehr and Bóztaghán, containing a few villages, and at a small distance from the mountain. O'rtákchí, to the West of Bóztaghán, is a similar Kádílik on the declivity of the mountain. Yení Shehr Aïdín (*i. e.* The New Town of Aïdín) has a Mosque, a Bath, and a Market. It is opposite to the Mountain of Tíreh, (Messogis,) and stands on the Northern declivity of one which extends from East to West, (Titanus,) and which lies behind this mountain. The road to

Devrend of
Yeni shehr.

Hamíd passes through a defile (*derbend*) called the gorge of Yení-shehr, (Yení-shehr bóghazí,) as it begins near that place. It is a large and intricate defile containing some ancient buildings, and the common people call it Derbendi Jálinderí.* (The Pass of Jálinder.)

Yení-shehr, which is described by Pococke (book ii. ch. x.) as a village at the entrance of a small valley, about six miles East of Arpáz, is on the site of the ancient Antiochia on the Mæander, from which it is distant about three miles, and to which a little stream called Jenjereh, (Orsinus, *Plin. Nat. Hist.* v. 29.) passing by it, makes its way. It is on the North-West declivity of Mount Bába, (Cadmus,) and fourteen or fifteen miles South-West of it is Geíra, the ancient Aphrodisias. Birgí,† to the North of Tíreh, is backed by a hill, but is open in front to the South. On the South-West side (of the plain) opposite to this mountain of Birgí, (Tmolus,) there is another on which Tíreh is built, nearly opposite to Báliyánbóli of Aídín. Mermerehjik, to the East of Birgí, and built like it against the side of a hill, is very near it. Birgí has a Mosque, Bath, and Market, and of all its fruits, pomegranates are the most abundant; it has excellent air and water, and many water-mills. Its mountain, which is Bóz-tágh, is the Summer abode (Yaílák) of the people of Maghnísá, Tíreh, Akhisár, and Mermerehjik, (Little Marmora,) mentioned above, is a Kádílik in the same neighbourhood, to the East of Birgí. Báliyánbóli of Aídín, placed on the declivity of the mountain to the South, and opposite to Mermerehjik, has a few villages within its jurisdiction. Alá shehri Aídín (the beautiful city of Aídín, anciently Philadelphia) is a large city and castle; all its houses are surrounded with stone walls. It is now, says Chandler, (249.) a mean but considerable town of large extent, spreading on the slopes of three or four hills. Of its walls many remnants are standing, but with large gaps; this city being peculiarly subject to earthquakes. A sulphureous medicinal spring in its vicinity, the wall of cylindrical petrifications commonly taken for bones, and the ruins of its twenty-four Churches, of which six were then (in 1765) still in use, are the only objects noticed by that traveller; but a just apprehension of the plague made him hurry away from the place.

Ainé gueul.

"It has Aíneh gól of Aídín (Gygæus) on the West, Kúlah (Mæonia) on the East," says the *Jihán numá*, (p. 637.) "Tímúrjî on the North, and Alá tágh (Beautiful Mountain) not far to the South." Aíneh gól of Aídín (the principal town on the Lake Coloë) is near Sart (Sardes) and North-West of it, East of Mermerehjik, (Little Marmora,) West of Alá Shehr, and South of Atálah. (Attalia.) It is a populous town on level ground having a small lake (Gygæus, or Coloë) on its North side. Keles is a town built on the declivity of a hill to the East of Báliyánbóli, and South-East of Mermerehjik, having a level tract on its Northern side filled with

Keles, or
Kilis.

* The Pass of Jálinder was at or near the celebrated shrine of Sōma Nāt'ha in Gojerát, plundered and destroyed by Mahmúd Ghaznevî, the first Musulmán invader of Hindústán. Derbendi Jálinderí may here mean nothing more than "The Idol-temple pass;" but that the first Mohammedan possessors of Caria should have used the Persian Language is remarkable. Did the Seljüks lose their original Turkish after their establishment in Persia? At present, the people of Bukhárá, though of Turkish origin, speak nothing but Persian.

† The native place of Mohammed, author of the well-known Turkish Catechism called Birgílu Risáleh; its name is, therefore, Birgí, not Bereki, as Colonel Leake writes it.

fields of lucern, or gardens of apples, and pomegranates, planes, and cypresses. Sart (Sardes) lies on the road leading from Maghnísá South-Eastward to the Summer Quarters (Yaílák) on Bóz-tágh, (Tmolus,) at the North-Western foot of which it lies one day's journey from Maghnísá, and a day and a half from the Yaílák upon that mountain. It was in early times a very large city, and there are still some traces of its walls remaining, and plenty of running water. The road from it across the middle of the Bóz-tágh of Aídín leads to Birgí; Aíneh gól lies to the North-West, and Alá Shehr to the North of Sart. The Mountain of Birgí lies between Maghnísá and Tíreh, and on its Western* declivity there is a very large mountain called Bóz-tágh, (Ice Mount,) in the Yaílák of which the Princes of the House of 'Osmán used to spend three or four months every year. On the Eastern side of this mountain there are, in one or two places, cultivated plains called Khávdárlík. (Silky down.) There is also a lake on this mountain, called Guljik (Little Lake) by the people of that Country, or the Lake of the Mountain of Birgí. It is ten miles in circumference, and supplied with water from a spring in a large garden at its Northern extremity. The great men used sometimes to amuse themselves in a boat on this lake. It has some fish, but they are never caught. The inhabitants of the surrounding Country have established Markets, and built Baths and Mosques in one or two places, as well as an Oratory for the celebration of the prayer at the feast ('íd) of Baíráam. On the South-East of this Yaílák there is a mountain called Makámí arba'ín. (The Station of the Forty.) The summit of that mountain is very rugged and difficult of ascent, and on the side of the peak which is immediately above the Yaílák, between it and the summit of the Birgí Mountain, there is a vast perpendicular cliff, (*sakhrá*), from which the powerful heat at mid-day is reflected upon the inhabitants of the Yaílák and is very oppressive. In the interval between these two summits there is a Convent, (*Tekeh*), built by one of the Persian Seyyids, Bába Rashíd, for the refreshment of the Dervishes in the season of the Yaílák. It has an agreeable stream of running water. Kestáneh tágh (Chestnut Mount) is a mountain and Yaílák on the South-East side of Tíreh which has Mosques and Baths, and is much frequented by the people of Tíreh in the Summer season. It has also markets to which the people, having gone down into the city immediately after the call to morning prayer, return at sun-rise with all the necessities of life.

8. Menteshá is bounded on the North by Tíreh, on the West and South by the White Sea, (Archipelago,) on the East by Antáliyeh, (Attalia,) and part of Kútáhiyeh. Its Kádíliks are: U'zumlú; (*i. e.* Grapy;) Eskí hisár; (Old Castle;) Ashin; Aghirtús; U'rleh, or Vurlah; Perákendehí Menteshá; (the Ruins of Menteshá, *i. e.* Myndus;) Bertáz; Bózúyúk; (Icy Peak;)

* West, evidently by mistake, in the *Jihán numá*. (p. 637.) The mountain immediately behind Magnesia is Sipylus, separated by a depression, not an absolute break, from the modern peak of Takhtahí, the highest point near Smyrna, and at least 3000 feet above the sea. From thence the range bends to the South and East nearly in a South-Easterly direction, and is traversed to the South-East of Níf, (Nymphæum,) by an ancient road which leads from the plain of the Hermus to that of the Cayster. On a perpendicular rock by the side of that road is one of the figures of Sesostri mentioned by Herodotus. (ii. 106.) This mountain must be Kizil Músá of the Turks, and is a part of Tmolus.

NA-TOLIA.	Bechín; Chinah; Dúker; Sárúlús; Súbeijah; Tátiyeh; (Hiding place;) Tiráhiyeh; (Parley place;) Feslegán; (Sweet Basil;) Germeh; Karah ovah (Black Plain) with Búdrum; Giránish, or Keránesh; Gók-ábád, (Heaven's abode,) or Gók óvah; (Heaven plain;) Tarás; Kóijigiz Mázún; or Gók úyúk; (Gall-nut, Heaven's peak;) Masúl; Makrí; Mandáliyát; Moghollah, or Moghlah; Yereh kesikí, (cut down to the ground.) Moghollah, or Moghlah, Capital of this Sanják, is a celebrated city four days' journey South of Kúsh-átá-sí. (Scala Nova.) It has been visited by few European travellers, and no further account of it appears to have been yet published. Menteshá is two days' journey West of Deniz-lu. Távas (Tabæ) is a Castle and Kádílik, which has a weekly market, one day's journey inland from Menteshá. Such is the scanty account of this Sanják given in the <i>Jihán numá</i>; (p. 638.) and as this part of Turkey has been little visited by European travellers, it is difficult to obtain any satisfactory information respecting its inland districts. Of the coast much was learned, for the first time, from the Egyptian expedition in 1800; and our acquaintance with it was nearly completed by Captain Beaufort's Maritime Survey in 1811 and 1812. It is broken by several gulfs, or very deep inlets, of which the first is named from a fort at its Eastern extremity, the Gulf of Ashin Kal'ehsí, (the Castle of Ashin.)* It is a mean but extensive fortress on the summit of a rock, the Northern side of which is abrupt and almost inaccessible, having at its foot a small portion of level ground on which the ancient city of Jasus stood, the walls being, in 1765, nearly entire, and a Theatre in the side of the rock facing North 60° East, easily traced though half concealed by bushes. This rock, anciently an island, is now joined to the continent by an isthmus of sand, and on the side of the opposite mountain there are still a great number of ancient sepulchres, and various inscriptions, scattered among the ruins, record the piety and meritorious acts of the Jasians. The castle had ceased to be used as a fortress, and the town seems to have been almost deserted when seen by Chandler. (181.) On the Northern side of this peninsula, Bargylia and Caryanda must be sought; the latter is probably the Port Páshá of Captain Beaufort's Map. (<i>Karan. p. 77.</i>) Menteshá, supposed to be on the site of Myndus, is now in ruins, near Cape Gúmishlí, (Silver,) at the extremity of the peninsula separating the Gulf of Ashin Kal'eh-sí from that of Cos. The mountains to the South of that cape are called Karah tágh (not bágh) lar, (Black Mountains,) and on the Southern shore of the same peninsula is Búdrum, (the Cellar,) on the site of Halicarnassus. "A more inviting or convenient situation," says Captain Beaufort, (<i>Karan. p. 89.</i>) "could hardly have been selected for the Capital of Caria. It rises gently from the head of a deep bay, and commands a view of the Island of Cos, and the Southern shore of the Ceramic Gulf as far as Cape Crio. In front of the town, a broad, square rock projects into the bay, on which stands the citadel, a far more respectable fabric than the generality of Turkish fortresses. On the Western side of the castle there is a small harbour, anciently formed by two stone piers which are now demolished; it is still, however, a snug port, frequented by the small Turkish cruisers, and there is generally a frigate or a sloop of war upon the stocks. The walls of	the ancient city may be here and there discerned, and several fragments of columns, mutilated sculpture, and broken inscriptions are scattered in different parts of the bázár and streets. Above the town are the remains of a Theatre, which measures about 280 feet in diameter, and which seems to have had about thirty-six rows of seats. Numerous pieces of exquisite sculpture are inserted in the walls of the castle; they represent funeral processions, as well as combats. Within the fortress, as Captain Beaufort was assured, there is a long frieze, with highly wrought figures, besides many other pieces of sculpture and inscriptions very little corroded by the weather. Keramos, to the East of Búdrum, marks the site of Ceramus, whence this was anciently named the Ceramic Gulf; and at Cape Krió, (Triopium,) at the extremity of the opposite side, is the small rocky peninsula which formed the double harbour of Cnidus." In Strabo's time, this bold and rugged island was connected with the main land by a causey; the junction is now a sandy isthmus, (Beaufort, p. 76.) on each side of which there is an artificial harbour; one small, with a narrow entrance between high piers; the other larger and formed by two transverse moles, one of which is still almost perfect. "The whole area of the city is one promiscuous mass of ruins, among which may be traced streets and gateways, porticos and theatres." The small gulf to the South of Cape Krió is called Sema, from the Island of Cynos Sema, (<i>Κυνὸς σῆμα</i>, Dog's tomb,) at the mouth of it. Beyond the neck of land terminating in Cabo Cavaliere, (Onu gnathus, <i>i. e.</i> Ass-cheek,) to the East of Sema, and sheltered by Mount Phoenix, is the excellent harbour of Mermerichah, Marmaritza, or Mármáris, in which the British fleet anchored on its way to Egypt in 1800: it is the Phúska of the modern and Physcos of the ancient Greeks; and somewhere to the West of it was Loryma, (<i>τὰ Λώρυμα</i>), an Episcopal See, subject to Stauropolis. At a short distance to the East of it is the Bay of Karah ágháj, (Black Tree,) called Panormus by the Greeks, from their notion of its extent and security, and nearly half way between it and Cape Pent'ecclisies (Five Churches) is the mouth of the river Calbis, the largest in this Sanják, to the East of which is Kóijik, or Kóijigiz, on the site of the ancient Caunus, the port of which is now a lake communicating with the sea. (Rennell, ii. 47.) Its excessive heat and unhealthiness were rendered proverbial by the witticism of Stratonicus. The river anciently called Axon is twelve miles East of Kóijigiz. Near a point (Artemesium Promont.) beyond the mouth of the Axon, is the modern village of Pent'ecclisies, at the entrance of the spacious Gulf of Makrí, called Glaucus by the Ancients, from the river running into it. Near the head of that gulf is Karya, on the site of the ancient city bearing that name, and beyond it was Dædala, in the neighbourhood of the town and hill now called U'rlah, or Vurlah, (<i>Ουρλίε</i>), according to Meletius, (iii. 174.) who, however, with regard to this part of Asia Minor, does little more than copy Moletius, (the translator and commentator on Ptolemy,) and is not therefore an original authority. Near the mouth of the Glaucus is Méi, on the site of Telmessus.* That place was an Episcopal See, subject to Perga, and the first place in Lycia, as it is	NA-TOLIA. Keramo. Crio. Triopium. Cnidus. -----------	--	--	---

* This name, variously spelt, Askem, Assem, and Assyn, is probably the Kádílik of Ashin mentioned above.

* Was this name converted into Tel Meis by the Turks? If so, the *Mé* of M. de Choiseul Gouffier, and the *Meis* of Captain Beaufort, who took it for the name of the Province, may be easily accounted for.

- NA-TOLIA. now near the boundary of Menteshá. Makrí, about six or seven miles North-West of Méi, was probably constructed from the ruins of Telmessus. To the North-East of Vurlah, and forming a triangle with it and Makrí, is Távás, a Kádílik, on the site of Tabæ; and to the South-West of it, but North-West of Moghlah, is Eski hissar. About eighteen miles to the North-West of that place, and a little more than twelve miles South-East of Ashin-kal 'eh-sí, from which it is separated by a high mountain, is Mylasa, which among the Greeks still retains its ancient name, and has some remains of antiquity. It was celebrated for the number of its Temples; and is about ten miles from the Ceramic Gulf. It is a considerable town, interspersed with trees and gardens, in a plain surrounded by mountains and unhealthy, probably from the stagnation of the air. (Chandler, p. 187.) The beautiful Temple to Augustus and Rome, described and engraved by Pococke, was in a great measure destroyed a short time before Dr. Chandler visited the place. A column commemorative of Menander, son of Uliades, and grandson of Euthydemus, an ancient gateway, the remains of a theatre, altars, pedestals, aqueducts, and fragments, scattered over the plain, marked the extent and riches of the ancient city. Eski hissar (Old Castle) is only a small village in a dell surrounded by woody hills, embosomed in lofty mountains, and watered by a limpid rill, falling in cascades from the neighbouring rocks. Marble fragments scattered every where, a solitary column here and there, a theatre on the side of a hill, the seats and proscenium of which were still discernible in 1765, walls, arches, altars, and sepulchres, with occasional inscriptions, attest the splendour of Stratonicea before it had suffered from the lapse of Ages, and devastations of Barbarians. The mountains here are a part of the Western outskirts of Taurus, which extends its various branches from hence to the Mæander and the Western and Southern Sea. Lakína, to the North of Eski hissar, is probably the ancient Lagina, much frequented on account of the Temple of Hecate, and to the North-East of Ashin Kal'eh sí, near Mándaliyát, is a fine Temple, and the ruins of Labranda. On the Eastern boundary of the Sanják at 'Arabí hissar (Arab Castle) are the ruins of Alinda,* situated on two hills; its walls, a theatre, and a church were traced by Pococke. (ii. 7. § 88.) Ten miles North-West of 'Arabí hissar is Kárpúzlí, (Water Melon Place,) the ancient Alabanda, (Rennell, ii. 51.) near the Chinah súi.
9. Tekié. 9. Tekeh, bounded on the West by Menteshá, on the South by the White Sea, on the East by 'Aláiyeh, and on the North by Hamíd, has the following Kádíliks: Almá-lí; Antáliyah, (Attalia,) I'gdir; Finikeh; Kásh; Kalkánlú, (Shielded,) Karah hissar (Black Castle) of Tekeh; Kareh Kayá, (Black Rock;) Germíkí. On the coast of this Sanják, at a small distance from the Gulf of Makrí, is a broad and broken promontory, called Yedí Búrun, (Seven Noses,) being a part of Mount Cragus, between which and Meí (Telmessus) is Anticragus, rising at least 6000 feet above the sea. Beyond the Seven Capes is a small stream, the Echen-cháí, (Echen River,) named from a corruption of Xanthus, (Exenfidí?) an Episcopal city eight miles and a half above its mouth; immediately beyond which are the ruins of Patara, celebrated for the shrine whence Apollo was called Patareus. (Hor. *Od.* iii. 4. 64.) Its Theatre, Temples, walls, and other remains are briefly described by Captain Beaufort. (*Karan.* p. 2.) Castel Rosso is a Genoese or Venetian fortress, built on the island called by the Greeks Megiste, near Antiphellus, (still retaining its ancient name,) off the Southernmost point of Lycia. Phellus, on the hills above, was a Bishopric, and Myra, a few miles to the North-East, the Archbishopric, which was its diocesan; the latter being only three miles from the mouth of the little river Andriacé, which still retains its ancient name. Its Theatre is very perfect, and there are many fragments of ancient sculpture, but its Musulmán inhabitants are more than usually fanatical and intolerant. Beyond Myra are the town and river of Limyra, near the mouth of which, a considerable but shallow lake is now formed, communicating with the sea by a very narrow channel, and the mountains behind it, bending to the Southward, form Cape Phænicas, or Finikeh according to Meletius, (iii. 175.) near the ancient Aperrhæ; (Captain Beaufort, p. 32.) the old castle on the Eastern side of the cape being in favour of that supposition, but it appears to be of Genoese origin, and there are no traces of a Greek or Roman settlement. The Chelidonéan Cape and Islands, now five, anciently only two or three, form the Western extremity of the spacious Gulf of Attalia. Their number appears to have been increased by a natural but remarkable process, the washing or crumbling away of a broad stripe of serpentine extending across the whole rock of which the island is composed. (Beaufort, p. 38.) Round the point of Cape Chelidonia is Adrachán, apparently Mount Phænicus of Strabo; and just beyond it Deliktásh, (Pierced Rock,) on the site of Olympus, as is marked by inscriptions found there. (Beaufort, p. 43.) Its Theatre and Cemeteries are also still deserving of notice. In the hills behind these ruins, at the head of a rocky and thickly wooded glen, Captain Beaufort and his party witnessed a singular phenomenon. In the inner corner of a ruined building they found the wall undermined so as to leave an aperture of about three feet in diameter, and shaped like the mouth of an oven, from whence there issued a flame intensely hot but entirely free from smoke. The surrounding earth and shrubs seemed scarcely, if at all, affected by this subterranean fire. The hill is composed of serpentine, with occasionally loose blocks of lime-stone, and no volcanic productions are found near it. This flame, he was told, is constantly burning and unquenchable, but not accompanied by any noise or commotion of the earth. This is evidently the "undying flame," *πῦρ ἀθάνατον*, of Mount Chimæra, in the territory of Phaselis, described by Ctesias, (Plin. ii. 110. v. 28. Photii *Bibl.* lxxiii. p. 146.) and more particularly by Methodius, (Photii *Bibl.* p. 924.) who mentions the flourishing state of the Agnus Castus shrubs growing round the fire, which rises spontaneously from Mount Olympus in Lycia; "a fire," says Maximus Tyrius, (*Diss.* viii.) "not like that of Ætna, but steady and constant." (Walpole, *Turkey*, ii. x. xiv.) The lofty peak of Takht-'Alí, (the ancient Solyma,) rising 7800 feet above the sea, towers over the small peninsula which is covered with the ruins of Phaselis. Its three ports and lake can still be traced; though the latter, at least towards the close of Summer, is reduced to a mere swamp; (Beaufort, *Karan.* p. 56.) but the sea has encroached so much upon this peninsula that, at no distant period, few vestiges of Phaselis, it is
- * They are, perhaps, to be sought at Elæna, nearly half way between Moghollah and Chinah, ten or fifteen miles South-East of Arabí hissar. (Rennell, ii. 53.)

to be feared, will be visible. It is called by the Turks Tekr-ová. (Dekr óvá; garden plain.) The neighbouring coast, called Corycus by the Ancients, is termed Chirá-lí (Resinous) by the Turks, on account of the pines (Chirá ágháj) with which it abounds. Av-ová, (Bird plain,) perhaps Lynessus, and a chain of mountains regularly overtopping each other, and thus verifying their ancient name, Climax, (a ladder,) bring the shore round to the central point of the bay, and present the city and harbour of Antáliyah, (Attalia,) the Capital of Tekeh. It is a very ancient city, triangular in shape, supposed by the Turks to have been built by Zahák, one of the earliest Kings of Persia; it has a harbour and a strong castle, being well fortified, and garrisoned, says the *Jihán numá*, (p. 639.) with four hundred men. The adjoining plain and hills are very fertile, abounding in vines, lemons, oranges, dates, and all kinds of fruits. A river rising to the North has been brought into the city by an aqueduct. From a mountain to the North of the city issues another stream called Dúden, (Catarrhactes,) which is the outlet of the Lake of Egerder: it sinks under ground at some distance from the lake, and appears again in the neighbourhood of the gardens behind Antáliyah, the whole of which it waters, and then, passing by the city, falls into the sea at Kúprí házári, (Bridge Market,) a town and district in the Kádílik of Menávghát to the East* of Antáliyah. Many camels are pastured in the wastes covered with pinár, (prinári, from prinos, *Quercus coccigera*,) near this city, and sesamum (*súsám*) and strawberries (*chílek*) are very plentiful in this district, which is eleven days' journey from Burúsah. To the West of this city, a tongue of land called Shirden búrní (Cape Black-pudding) runs out into the sea for the distance of two days' journey; and as there are many uninhabited places on the coasts of this cape, they are never free from ships of war belonging to the Infidel Corsairs; and a castle is wanted in that district. Estenáz, (Stenos?) in the territory of Antáliyah, at one day's journey to the North-West of it, is the Summer residence (Yailák) of its inhabitants. It is one day's journey South of the Kádílik of Tefení in the Sanják of Hamíd; is placed on an open level ground in an elevated position, and most of its trees are hazel-nuts. (*Funduk*.) In the Summer nobody remains at Antáliyah, except the Dizdár (Castellan) and some Infidels; all the rest of the inhabitants occupy shops and houses in this town, which is the Sú-báshílik (residence of the Bey or Governor) of Tekeh. A large river passes by it, and, according to the Maps, falls into the Dúden, just above Kúprí-bázari. Kizil Kayá (Red Rock) is a Kádílik comprehending ten villages on a plain, to the North-East of Antáliyah, between it and Aghlásún. It has a Bázár and a chárdák, (a covered court,) beneath which the Kádí sits. I'gdir, one day's journey West of Antáliyah, is a Kádílik containing nine or ten villages in a very stony country, on the side of a rugged, almost impassable, mountain near the sea. It has its Summer and Winter quarters, (Yailák and Kishlá,) and its inhabitants in Summer-time withdraw into the villages in the mountains, through fear of the Infidels. Charrob trees (*Ceratonía siliqua*) abound in its mountains, and its grapes and figs are excellent; but grain is scarce, and its principal trade is in timber. Most of its inhabitants are weavers. The Ak sú (White

* Placed to the West of Attalia in Poirson's Map, compiled for Sonnini's *Travels in Greece*.

Water) which passes between Antáliyah and Karah hisár of Tekeh, runs into the sea opposite to the latter, and another branch of it, which passes between the latter place and Germíkí, enters the sea there. Takht 'Alí ('Alí's Throne) is a very large mountain near I'gdir.

10. Hamíd, which derives its name from Hamíd Beg, Governor of the Country under the Princes of the House of Seljúk, is bounded on the South by Antáliyah, on the West by Germián; on the North by Ak-shehr; and on the East by Beg-shehrí. Its Kádíliks are Ispártah; Aghlásún, or 'A'sí Karah Agháj; Ighrásh; Evshár; U'lú Búrlú; Egerder; I'rleh, or Ayirleh; Injír házári; Bárleh; Báveli; Búrdur; Tefení; Kúlí, or Gólí; Havírán, or Huveírán; Serúz; Gechí Búrlú; Hamíd Kemer; Gól-hisár; Karah Agháj; Kúnán; Hamíd Yelváj; Yelváj karah ágháj; Yávijeh. The Capital of Hamíd is Ispártah, (Baris,) a large unfortified city in a healthy air and fertile country, well watered, but suffering severe cold in Winter. Water has been brought to this city from a great distance. Its gardens and vineyards are also supplied with water by a stream which flows from the very high mountain lying Southward between this city and Aghlásún. The best bóghásies (a Bocasines kind of stuff) are made here; and there are many Dyeing-houses. The longest day here is fourteen hours and a half. (*Jihán numá*, p. 640.) In the centre of the Sanják of Hamíd-ílí is the Lake of Egerder, a basin (*ghadír*) of fresh water ('*azb*) measuring four farsangs and a half (about fourteen miles) from North to South, and three farsangs (eight miles) in breadth. Its depth is ten fathoms. (*Kúláj*.) There are two islands in it; a larger one called Neïs or Nís, and a smaller named Ján. The lake contains five different kinds of fish, which are taken in the beginning of Spring. It is a wonderful lake, and among the white pebbles on its shores some are found on which the name of God has been miraculously inscribed. The outlet from this lake, after running for two days' journey, sinks under ground in a sort of whirlpool, at a place called Dúden, one day's journey from Antáliyah, and emerges again from the ground near the Custom-house gate of that city. On the Western side of the lake, and within it, is Egerder, a small, well-guarded fortress which has much-frequented Markets, Mosques, and many Baths. It contains a College, several pious foundations, and the tombs of many great saints (*Evliyái 'izám*) of the Nákhshbendí (Iconoclast) order. It is three days' journey from Kútáhiyeht, and is said to have thirty-six different kinds of grapes. The small island opposite to it, is uninhabited, but covered with gardens and vineyards; and the larger one, to the North of it, contains two hundred houses, inhabited half by Moslems, and half by Infidels; in it also some great saints are interred. Its male inhabitants are boatmen; its women weavers of fine cloths. (*Bez*.) On the Súrí náz, a mountain above the suburb of Egerder, there is a strong castle called Kelíb, built by the Infidels, and taken by Seyyíd Battál, the conqueror. It is a journey of six hours to the summit of that mountain. The whole Kádílik of Egerder is full of high mountains, woods, and springs. One of them called Ebsáfíróš (or Aísáfíróš) cannot be ascended in less than twenty-four hours, and is covered with snow from ten to fifteen ells (*arshín*) deep, in the hottest season of the year. In the Spring wonderfully fine flowers are found there. In a plain in the middle of that mountain there is a fresh-water lake, ten miles long and five miles broad, surrounded by meadows;

- NA-TOLIA. above it there is nothing but snow. Yelváj is a healthy town in a very fruitful tract famous for apples, pears, and cherries, on the Eastern side of the Lake Egerder. Bavlú is a lofty mountain near Egerder very productive of grapes and white mulberries, from which a favourite sweetmeat (*pekmez*) is made. Bárleh, in a valley between two mountains near the Eastern side of the same lake, is also famous for its raisins. Havírán, or Huveírán, is a castle on the North side of the lake, having the command of thirty-six villages. It has Kútáhiyah on the North; Yelváj on the East; and Evshár on the South. Its air is heavy, and its inhabitants were formerly migratory, being the head Tribe of the Yúruk, (wandering Turkmáns,) but they have since settled in villages. 'A'sí karah ágháj (*i. e.* Rebel Black Tree) is a town and Kádílik in a level country, one day's journey to the West of Ispártah. Its inhabitants are turbulent Turkmáns. Dénizlú is one day's journey Northward across Mount Kázik and at the same distance Southward is Tefení,* a Kádílik, on the confines of Hamíd and Antáliyah or Tekeh. Evshár, or Efshár, is a town and Kádílik on a plain, one day's journey North of Ispártah, and an hour and a half (about five miles) from the Lake of Egerder. It has thirteen villages under its jurisdiction, some of them like towns; two especially, one of which is named Kelendús. Its inhabitants are weavers; they manufacture bóghásies, and have many Dyeing-houses; but the air is heavy.† Aghalásún (Sagalassus) is a town and Kádílik, on a hill on the outskirt of a mountain to the South of Ispártah. It has only one gate, on the West side, to which there is a very steep ascent. In the valley below, on the same side, it has well-watered gardens and vineyards; and within the walls, a Bath, Mosque, Market, and Dyeing-house. Gechi Búrlú, (Goat-waste) is a small town and Kádílik, half a day's journey South of U'lú Búrlú. (Great Waste.) Its inhabitants are manufacturers of bóghásies, and it lies to the North of Ispártah, opposite to the mountain of Sugút. In a place six miles from Egerder, there is another fresh-water lake; it is sixty miles long and forty broad; its fish, called fresh-water fish, (*tatlú bálík*.) weigh from ten to fifteen ókahs, (twenty-two to thirty-three pounds,) and are caught in Lent. (*Arba'in*.) 'A'sí karah Agháj and Gól-hisár are on the edge of the Lake of Búrdúr, which is like those of Hamíd and Egerder, but its water is salt. It stretches to the North and North-West, and its shores are very picturesque. (Walpole, ii. 260.) Gól-hisár having become a resort of thieves, was destroyed in former times. On the skirts of the Karah tágh, which separates Hamíd from Ak-shehr, fifteen or twenty miles North of the Lake of Egerder, the ruins of the Pisidian Antioch must be sought; few parts of Asia Minor have been less explored than this.
11. Karah Hisár Sáhíb (Lord's or Companion's Black Castle) is bounded on the South by Hamíd; on the East and North by Ak-shehr; and on the West by Kútáhiyah. Its Kádíliks are Bárchinlú; Búlávádín; Chái; Chól-ábád; Sinjánlú; Shuhúd; Sandúklí; Karah-mak; the districts of Bárchinlú; and O'ínásh. Karah Hisár Sáhíb, also called Afíyún Karah Hisár from the cultivation of opium in its neighbourhood, is the Capital of this Sanják, and one of the largest cities in Asia Minor, standing in 38° 35' North and 30° 20' East, (Kinneir's Map,) or 38° 46' North and 30° 28' 40" East. (Rennell.) It is singularly placed at the base of a high and perpendicular rock, which rises in the centre of a little recess formed by the great range of Káldur tágh, (Towering or Stopping Mountains, a part of the Sultán tágh, one of the branches of Taurus,) which here terminates its course Northward. At the foot of this cliff on its Southern side, and on the declivities of the adjoining mountains, stands the town opening to the plain on the East, and said to contain 60,000 inhabitants, of whom 2000 are Armenians and about 800 Greeks. Twelve large Mosques, very many small ones, five Baths, six Kháns, and two ruinous Armenian Churches, are the public buildings noticed by Colonel Kinneir. (*As. Mts.* p. 231.) Black felt and opium are the principal articles of trade, and of the latter 10,000 ókahs (about 24,000 pounds) are made annually, the greatest part of which is sold at Smyrna. Sometimes twice that quantity is procured. An ancient bas-relief, brought from Serminah, a village about ten miles to the East, is preserved in the Armenian Church; and seven miles West of the town, there is a Monastery which has many subterraneous chambers. In the plain to the East runs a stream, called by Colonel Kinneir Akar-su,* which terminates in the Lake Eberdí, near Ak-shehr. Colonel Leake considers this place as the site of the Phrygian Metropolis. Bárchinlú and its Districts are the Northernmost Kádíliks in this Sanják, lying to the East of Khosrev Khán, on the road from Eskí Shehr to Búlávádín. That place is a large assemblage of miserable cottages, containing many fragments of sculpture, but all belonging to the Lower Empire, (Leake in Walpole, ii. 216.) and is doubtless the Polybotum of the latter Greek writers. Between it and Bárchinlú is Bayát, (the ancient Beudos,) about fifteen miles South-East of Khosrev Khán. Nearly due West of Karah Hisár is Sinjánlú, and to the South-East of it Sandúklí, both on the road from Kútáhiyah to Isbártah. The first is surrounded by villages in a fertile valley; the latter, (Euphorbium?) about twenty-one miles further South, on the banks of the Menderez, (Obrimas,) the Northern branch of the Mæander, which rises five or six miles South-East of Afíyún Karah Hisár. Shuhúd is South of Karah Hisár nearly in the centre of this Sanják; Chái, on its Eastern side; Karah-mak (*i. e.* Blackening, Fermah in the Maps) on its South-East; and Chól-ábád on its Southern confines. The chains of mountains through which the Menderez (Obrimas) flows are the Emír tágh (Prince's Mountain) on the North, and Sultán tágh (King's Mountain) on the South.
12. Germiyán, or Kútáhiyah, derives its name from its former Sovereign Germiyán O'ghlí, who ceded the castle of Kútáhiyah and some of its dependencies to the 'Osmánlú Prince, Khudávendikár, A. H. 783. (A. D. 1381.) It is bounded on the East by Hamíd and a part of Karamán; on the South by Aídín and Sárú

12. Kermian, or Kiutaia.
- * The name of this place is uncertain. In the *Jihán numá* it seems to be written Teghní, but the French translator, whose MSS. M. Poirson followed, read it Tefení, as is manifest from Teseni in his Map, by an error of the engraver. In the Map published under the direction of the Society for the Diffusion of Useful Knowledge, it is spelled *Terfaneh*, probably from some English Itinerary, as the superfluous *r* seems to show.
- † Either Abú Bekr ibn Behráh of Damascus, or his transcriber Ibráhím, has made some mistake here, as Aghalásún, from this description, is evidently a different place from 'A'sí Kará Agháj, though in the list of the Kádíliks those names are said to belong to the same place; and just below, the latter is said to be on the borders of the Lake of Búrdúr, and consequently fifteen or twenty miles North-West of Aghalásún.
- * That is "running water." Colonel Kinneir's guides, therefore, were probably ignorant of its proper name.

lintí; Kúreh; Gók úyúk; Geikler; Lázikkiyyéh;
Denizlí. Kútáhiyeh, the Capital, is placed on the foot
of a mountain, and has a castle on the summit of a
lofty rock, built, according to tradition, by the Sultáns
of Germiyán. Its seven Colleges, six vast and splendid
Mosques, eight or nine Baths, in one of which there is
a large reservoir of cold water, (*i. e.* a Bath in our
acceptation of the word,) its Bezestán, Bázárs, Kháns,
smaller Mosques, gardens, vineyards, abundance of
running streams, and charming pleasure-grounds are
duly celebrated by the *Jihán numá*. (p. 632.) The ver-
dant and delightful plain to the North of it is traversed
by the River Pursuk, (Thymbrius,) which falls into the
Sakáriyah, (Sangarius,) near Eskí shehr. (Dorylæum.)
The town is backed by a very lofty mountain, which is
fortified with two rows of forts one above the other;
and the inner castle, called Gevher nigín, (Jewel-signet,)
is spacious, and capable of sustaining a long siege.
The town below contains fifteen wards or streets, a
Court of Justice, and the Páshá's Palace. The water
of Ak sú (White Water) is conveyed by a small artificial
canal into a reservoir within the city; it is peculiarly
cold. The public walks and places of recreation are
very numerous, and the gardens produce a great variety
of fruits. On the West side of the city there is a
mineral spring moderately warm, in level ground, at a
place called Yónjah-lí, (*i. e.* abounding in lucern,) three
hours (nine miles) distant. It has a couple of
Baths and a Mosque; and in another part of the same
plain there are other warm medicinal Baths of great
efficacy in the cure of many disorders. Several distin-
guished persons and holy men were buried beside the
Mosque near them. This city, the ancient Cotyaëum, is
in 39° 22' North and 30° 8' East. (Rennell.) The ex-
tent of the city, steepness of its streets, number and
beauty of its fountains, its thirty Hammáms, fifty
Mosques, and twenty Kháns, are all noticed by Colonel
Macdonald Kinneir, (*Trav.* 237.) who mentions four
Armenian and one Greek Church. It is considered, he
says, as the Capital of Anatólí, and has 50,000 or 60,000
inhabitants, one-fifth of them Armenians, and one-tenth
Greeks, the latter for the most part very poor and
wretched. From the data obtained by Major Keppel
in 1830, the population now appears to amount to about
40,000, of which the Armenians and Greeks form about
one-twentieth each; and the Roman Catholics one-
thirteenth part of the whole number; the remainder being
Musulmáns. Its central situation is favourable to com-
merce, and a considerable trade was formerly carried on
between it and the other great towns of Asiatic Turkey,
especially in wool, goats' hair, (mohair yarn,) hare-
skins, and opium. The depopulating system, so univer-
sally adopted by the present Sultán, has been severely
felt in this place; 25,000 men had been already forced
to join the army in 1829; and in the latest levies even
those of an advanced age had been taken, and all were
sent to head-quarters pinioned, and with a chain round
their neck. In consequence of this, the place seemed
almost deserted, and some of the ordinary trades had
been abandoned for want of workmen. (Keppel, ii. 190.)

"In my walk through the city," says Colonel Kinneir, (p. 238.) "I saw several Greek inscriptions, but the jealousy of the Turks was such, that they would not permit me to copy them." Major Keppel, who was secured from any interruption in his search for antiquities by two Kavváses, sent by the Musellim, (Governor,) "looked in vain for Greek inscriptions," and Dr. Hall told him, "that he was equally unsuccessful," so that Colonel Kinneir's eyes must have deceived him; but the Greek castle, "at the point of the hill immediately overhanging the town, is in high preservation. At the gate there is a handsome statue of a lion in white marble; it is broken in two, but the pieces are near each other;" and in the interior of that building there is an ancient prison. Subject to Kútáhiyeh are the following districts: Tavshánlu; Gúmish; Altún tásh; Gerehgí; O'ranjik; Naváhi shehr; and Emrúd ílí, where there are two warm springs, called Kizil ílíjeh, (Red Thermal Springs,) the virtues of which are well known. Tavshánlu, (Full of Hares,) eight hours (leagues) North-West of Kútáhiyeh, is a considerable town, which has a Mosque and Bázárs, and a large Market once a week, its provisions being very cheap and excellent. It is two days' journey from Mudániyeh, and on the high road to Geli-bólí and the Bógház. (Gallipoli and the Strait of the Dardanelles.) It has seven Mosques, says Mr. Browne, (Walpole, ii. 115.) and a small Castle to the North North-West, is tolerably populous, and inhabited chiefly by Mohammedans. Major Keppel (ii. 388.) assigns to it about 2500 souls, 150 being Armenians, the rest Moslims. Opium and hare-skins form the staple of its trade. About a mile South of Tavshánlu is a stream which runs in a North-Westerly direction, and is there called Tavshánlu cháí. (Tavshánlu River.) It passes by Víránjik, (or Uíránjik,) nearly due West of Kútáhiyeh, and rises to the South-East of Cháv-dereh, (Rumour Vale, the ancient Azani,) eleven or twelve miles North-West of Altún-tásh, and is the Rhyndacus of the Ancients, as appears from Strabo. (xii. p. 576.) Altún-tásh is a district South by East of Kútáhiyeh thirty-two miles, (Kinneir, p. 234.) in a valley two miles West of the high road to Afíyún Kará Hisár. Gúmish (Silver) is a district (*Náhiyeh*) containing a few villages, on the high road in the neighbourhood of Kútáhiyeh, nearly due North, and not far from Tavshánlu. To the North of these places the crescent-shaped ridges of Mount Túmáníj,* (Olympus,) separate Germiyán and Sultán O'ní from Khudávendikár, as they anciently formed the barrier between Phrygia and Bithynia. Kedús, (pronounced Gediz,) one day's journey South-West of Kútáhiyeh, is a town and Kádílik, in a valley entirely surrounded by mountains. The River Kedús, descending from the Morád tágh on the South-East (Kibleh) side of this place, passes through the plain named from it. "Gediz," says Major Keppel, (ii. 240.) "occupies the slope and base of two mountains;" it contains about 40,000 inhabitants, and is entirely inhabited by Turks. Its principal article of commerce is scammony, which that traveller gravely remarks cannot find purchasers till it has been "further adulterated by the Jews of Smyrna, who manufacture it for the English." Had he inquired at Smyrna he would have found that little or no scammony is ever

exported from thence to England, and that the merchants there are too well acquainted with the drugs they purchase, to like them the better for being adulterated. That the mode of collecting this gum has not been long known at Gediz is highly probable, as few plants are more common about Smyrna than the *Convolvulus scammonia*, where the climate moreover is more favourable to the secretion of the gum, and yet, a few years ago, it was never gathered there, all sold in the Bázár being brought from Syria. The grapes at Gediz, continues Major Keppel, "are unfit for the confection of wine." Is this in consequence of the luxuriance of the soil? "The town is very unhealthy in the Summer months. It is watered by a river called the Gediz chái," (i. e. Kedús River,) long known to be the Hermus of the Ancients, as it retains the same name till it reaches the Archipelago: but no modern traveller before Major Keppel ever followed its whole course. "It enters the town from the North-West, and after winding through it with impetuosity, caused by the steepness of the mountain, passes out through a chasm of a high abrupt rock, which appears to have been cleft in twain from top to bottom to receive its course." (p. 241.) A monumental column, erected in honour of Asclepiades Capihius, inserted in the wall of a fountain in the Bázár, and the figure of a child sculptured in black marble, show that the place was anciently a town of some note; and the inscription beneath the latter contains the name of the Macedonian month Gorpiaeus and part of a date, belonging apparently to the epoch used in the inscriptions found at Kúlah (p. 345.) and Gólduz, (p. 357.) lower down on the banks of the same river. Another inscription on the bridge was made by order of the people called Abbasitæ;* and Cadi, near the source of the Hermus, was in the district called Abbasites, on the confines of Mysia and Phrygia. The river issues from a circular opening in the mountain, (Murád tágh, or Dindymene,) a little below the road, about nine miles North of Kedús. (Ib. p. 256.) To the North-East of that town, about fifteen miles distant, is Chávdereh hisár, (Echo-Valley Castle,) a village lying about twenty five miles South-West of Kútáhiyeh, and entirely built of the splendid ruins of the ancient Azani, a city well known by its coins, but only slightly noticed by the ancient Historians and Geographers. It is situated on the Eastern bank of the Rhyndacus, and besides an endless variety of scattered fragments, rows of erect columns, two ancient bridges and a quay between them, it has a Theatre and Stadium in very unusual preservation, and on an eminence, about a quarter of a mile to the North of it, a Temple of the Ionic Order, the walls and many columns of which are still remaining. Inscriptions copied by Major Keppel and Dr. Hall, and restored by Colonel Leake, as well as coins obtained there, all prove that these are the remains of Azani, and that this Temple was dedicated to the Æzanensian Jove. These ruins do not, however, appear older than the age of the Antonines. At Tátár Bazarjik, (Tartars' Little Market,) half-way between Chávdereh and Kútáhiyeh, another inscription was found identifying that place with Benna. "Ushák, one day's journey South-West† of Kútáhiyeh,

is a town with a castle in a valley near Murád tágh, and the head of a populous Kádilik containing 150 villages, it is on the Eastern side of an extensive plain, (Catacecaumene,) in which its villages are situated, and is celebrated for the manufacture of sejjádehs and kálíchehs." Kúreh is a town in a valley to the North-East of Selendí. Bánáz, lying between it and Kútáhiyeh, celebrated as well as Kúreh and Ushák for the manufacture of carpets, (kálícheh,) is a town in a valley on the Western side of the Murád tágh. Between it and the Kádilik of Sichánlú, to the South-East, is a very large mountain called Akhir tágh, the Summer abode of Yúruk and Turkmáns. Its air is beautiful: to the East of it is Altún óvah sí. (Golden Plain; Cilbianus Campus.) Selendí, to the North-East of Kúlah, and half a day's journey South-West of Kúreh, is a town on the declivity of a valley, where there is also a large village called Karah Selendí. Kilíms (rugs) and sejjádehs* (prayer-carpets) are manufactured there. It is now a village of thirty-three houses. (Keppel, ii. 374.) Between Selendí and Kúreh is the Kádilik of Sirgeh (Vinegar) in the mountains, in Abú Bekr ibn Behráms time abandoned, but now a village of fifteen houses, inhabited by "manufacturers of carpets." (Keppel, ii. 367.) It is just opposite to the site of Bagæ, on the Northern side of the Hermus. Kúlah, West by South of Sirgeh, is "a town," says the *Jihán numá*, "in the midst of a black rocky tract; it has a ruined castle, and on its Western side a portion of open plain; and the gardens and vineyards being incomparable between those mountains, produce Beylerjeh grapes, pears, and other fruits, the former in great abundance. The extremity of the plain to the West of this town is the boundary of Sárú-khán; and to the South-East of it is the Kádilik of A'nár. Most of its water is from wells." Kúlah, says Major Keppel, (ii. 337.) is eight hours East of Atalah. (Attalia.) "As we approached Kúlah," he continues, (p. 340.) "the road was entirely black, and strewn with cinder-like looking substances," (precisely the Karah táshlik of the *Jihán numá*.) "Wherever the rock was broken, it exhibited the same black appearance. The people here call this mountain Kará divít, or 'black inkstand.' On the opposite side of the hill the face of the country undergoes a complete change." The classical reader will not fail to observe how completely these accounts correspond with Strabo's description of "the Burnt Tract," (Catacecaumene,) on the confines of Mysia and Mæonia, "a country," he says, (xiii. p. 629.) "treeless, with the exception of the vine, which yields the wine called Catacecaumenites, inferior in excellence to none of the most esteemed; but it appears as if covered with cinders, and the mountains are stony and black, as if burnt." Kúlah, continues Major Keppel, (p. 341.) is built entirely of lava, contains eleven Mosques and 1500 houses; (about 7000 inhabitants;) of this number 150 are Greeks. The town is subject to the Governor of Kútáhiyeh. The trade consists in carpets, or rugs, on which the Turks say their prayers; (sejjádehs;) the average price of these articles is from 40 to 170 piastres, (20s. to

* Abbaeitæ in the inscription, if read rightly; but E and Z are more easily mistaken on a time-worn stone than in a MS.; the new reading, therefore, should not be adopted till confirmed by a careful examination of the stone.

† East in the *Jihán numá*, p. 633.

* The sejjádeh is a small carpet of the same form, but considerably larger than our hearth rugs, and is used by the Turks for their Religious prostrations, whence its name, (worship,) and the kálícheh, i. e. "little carpet," is the finest in texture and colour of all the Turkey carpets, but being very high-priced, is seldom brought to England. Ushák and its neighbourhood are still the districts in which the carpet manufacture flourishes most.

85s.) The town is celebrated for a red dye, and supplies Alexandria with red slippers. It produces also a considerable quantity of opium. Among the many curious inscriptions found there, some in which the name of Mæonia occurs, were brought from a village six miles off, called Ménia, which Major Keppel justly conjectures to be a corruption of the ancient name, and consequently an indication of the site of that town. "Ishiklú, (abounding in Monks,) or Sheikhlú, (abounding in Doctors,) is a town in a plain of one day's journey in extent, at the distance of two days South-West of Karah Hisár. It is the head of a Kádílik containing eighty-four villages, and is situated on the skirt of Ak-tágh, (White Mountain,) but has few gardens or vineyards, being wholly corn-land. Through this plain flows the Menderes, (*Jihán numá*, p. 634.) which rising from one source at Bunár báshí, (Spring Head,) one post (Menzil, *i. e.* Station at the end of a day's journey, and thence an Inn or Post-house) above the town of Hómá, runs by it, and passes from thence, between the Kádíliks of Báflák and Chál in the plain of Ishiklú, to the Kádílik of Chehár-shenbeh, near which town it is joined by the Múrád tághí súi, (Múrád tágh River,) a large river coming from Bánáz* to and running between it and Ishiklú. The united streams enter the sea in the Kádílik of Balát, (Miletus,) in Aídín, between which Sanják and Germián this river forms the boundary. Pococke, who describes the site Ishiklú as extremely beautiful, saw several inscriptions there, but none which determined the ancient name of the place erroneously taken by him for Apamea Cibotus, but now supposed to be Eumenéa on the Glaucus: the real source of the Mæander being at Dinglar, as Pococke was informed, about eighteen miles nearly due South of Ishiklú; in that neighbourhood, therefore the remains of Apaméa Cibotus and Aulocrene must be sought. "Báflák, adjoining (on the South-West) to Sheikhlú, (or Ishiklú,) and lying to the East of Denizlú, is a Kádílik containing ten villages. Chál,† lying between the Kádíliks of 'Ushák, Báflák, and Ináí, (or Eínáí,) contains thirty villages, and is traversed by the Menderes-súi. (Mæander.) There is a weekly market called Khálí Bázári, in a valley upon the river. Hómá,‡ on the skirt of Ak-tágh, (Messogis,) in the plain of Ishiklú, and on the South-East side of it, has a level surface, half of which is corn-land, and half filled with rushes. A mountain, one side of which is Geikler,§ on the other Sugút tághí, separates Báflák from Táz Kírí, (Mud Waste,) lying to the South-East, on a level but barren plain; it has gardens and vineyards, and is supplied with water by wells. This Kádílik contains five or ten villages. Geikler, (Stags,) or Keikler, (Fleas,) to the East of

* It appears hence that Colonel Leake has been misinformed, as he gives the Bánáz-súi (Bánáz River) a North-Western course, and carries it into the Kedús instead of the Mæander. He has probably placed Ak tágh (Messogis) too far to the South. Ishiklú is on the Southern side of Ak-tágh. Pococke (ii. 12. § 107.) shows that Múrád tágh is manifestly the culminating ridge, as from it flow the Rhyndacus and Thymbres to the North-West and North-East, the Hyllus, Hermus, and Mæander to the South-West, and the Akar-su to the Lake Eberdí, lying South-East. The Menderes, here described, seems to be the Glaucus of Colonel Leake.

† North of Ináí, North-West of Bafiac, North-East of Gók úyúk, South of Selendí, and East by South of Kúleh, in Ibráhm's Map.

‡ Omai in the Map of the Society for the Diffusion of Useful Knowledge; South-East of Ishiklú, and West by North of U'lú Búrlú in Ibráhm's.

§ South-East of Táz kírí, and West by North of Gechí Búrlú in the Map.

Tázkírí, is a large village, the head of a Kádílik, and is watered by a small stream. Gók úyúk, a Kádílik adjoining to Aídín, contains a few villages; its inhabitants are styled Bóz-yókush. (Icy-slope.*) Denizlú, (maritime, or abounding in seas,) otherwise called Lázikiyyeh, (Laodicea,) is a populous town, (*kasbah*,) having abundance of gardens and vineyards, in a plain surrounded on all sides by mountains, from one side of which there are running streams, and from their great number its name is derived. It has twenty-four wards, or streets, seven Mosques, five Baths, and many Kháns, besides a small Castle built by the Infidels. A stream of running water, which issues from a reservoir, (*haúz*,) called Hór-sólóz, diffuses itself in every direction, and becomes a river, the banks of which form a very agreeable promenade. (Mesíreh.) On the Western side of this town there is a mountain called Kúchuk Bába; (Father Little, *i. e.* Cadmus;) that on the Eastern side of the plain in which it stands, is called Mount Chúkluz, from a person buried there, whose sepulchre is a place of pilgrimage. On the South-East side is the Kázik-lú belí tágh, (Middle Pile or Stake Mountains,) on the opposite side of which is 'A'sí Karah Agháj in Hamíd. Denizlú is compared by Chandler to Sighahjik, being fortified only with an ordinary wall enclosing a few cottages. Eskí hisár, (Old Castle,) the site of Laodicea, is about three miles nearly due North, on a hill between the modern village and Denizlú. An aqueduct, an amphitheatre begun in the seventh year of Vespasian, (A. D. 78,) and finished in the Proconsulship of Trajan, (A. D. 91,) a Gerusia, or Senate-house, an Odeum on the side of the hill facing Southwards, a Gymnasium, and vestiges of the city walls could still be traced in 1765. The city was close to the junction of the Caprus (Gúmish kóí sú) with the Lycus, (Gók-bunár,) which flows at a short distance in the plain beneath, while the Eastern side of the hill is washed by the rivulet called Hór-sólóz, the Cadmus of the Ancients, which rises in the mountain bearing the same name, now called Kúchuk Bába. Chandler (p. 227.) seems to have taken the latter river for the Lycus. On the other side of it, at the edge of a lofty white cliff, just beneath the summit of the mountain, is Pambúk kal'ehsí, (Cotton Castle,) the ancient Hierapolis. It derives its name from the white incrustation on the cliff on which it stands. "It has the appearance," says Chandler, (p. 230.) "of an immense frozen cascade of water suddenly petrified in its headlong course." The whole country, he adds, appears to be volcanic; and the springs of Hierapolis are all impregnated with calcareous matter which is deposited as the stream advances, and forms these singular petrifications. The water here issues from an ancient bath on the summit of the cliff, where a Theatre, Gymnasium, and Stadium, with a Castle erected in the Middle Ages, surrounded by the ruins of less considerable buildings, occupy an area of a mile in length and one-fifth of a mile in breadth. All doubt as to the ancient name of the place was removed by several inscriptions then extant, and there were many relics of ancient sculpture, which might have been described and copied but for the rapacity and lawlessness of some of the neighbouring Aghás, whose threats and extravagant demands drove Dr. Chandler and his party into more orderly districts. He was thus prevented from exploring the Plutonium, which appeared to be

* This tract must be near the summit of the Ak tágh, and not far from the source of the Cogamus.

known by fatal experience to the neighbouring goat-herds. At the distance of three hours from Denizli, and on the West side of the plain, is Azíneh, or Adhíneh, (Athenæ?) a Kádílik having a weekly market, and containing a few villages. Chehár-shenbeh (Wednesday, perhaps from the market-day) is also in the plain of Denizli, two hours (six miles) North-West of Azíneh.* The village of Búládán has a weekly market. "The houses," says Chandler, (p. 245.) "are numerous and scattered on slopes, with a bridge crossing the bed of a torrent." From the windows of a small but very neat Khán, then newly built, there is an extensive view over the plain, and part of the white cliff of Hierapolis is visible. This place is four days' journey East of Smyrna, and eight or nine miles West of the ruins of Tripolis, which are about a quarter of a mile from the village of Kúsh Yenijeh Kóí. (Smith, *Seven Churches*, p. 245.) Khónáz is a town in the plain of Denizli, on the Northern declivity of a vast snow-capped mountain, (Cadmus,) having a castle on a very precipitous rock, vineyards, gardens, and running waters; as most of its inhabitants are Greek tributaries, (*zimmí*,) it was given to a pious foundation by Sultán Suleimán.† Khónáz is the Turkish mode of expressing *Xónas*, the accusative case of Chonæ, which, as we learn from Constantine Porphyrogenetus, (*De Them. ap. Banduri Imp. Orient. i. 8.*) was the name already given to Colosse in the XIth century; and that city, on the Lycus, not on the Mæander, as Chandler (p. 240.) erroneously supposed, was an Episcopal See under the neighbouring Metropolitan of Laodicea. It was the native place of the Historian Nicetas Choniates, who calls it (vi. 1.) a large and wealthy city, (in the XIIIth century,) much frequented on account of the splendid Church of St. Michael the Archangel, erected in memory of the miracle performed there on Archippus. It is probable also that the Epistle addressed by St. Paul to his converts at Colosse, gave to that place at an early period a considerable sanctity in the estimation of Christians. "Colosse," says Dr. Smith, (p. 249.) "by the Turks called Chonos, (Khónáz,) is situated very high upon a hill, the plains under it very pleasant; but we were no sooner entered into it but we thought fit to leave it, the inhabitants being a vile sort of people, so that we doubted of our safety among them. There still (in 1670) remain some poor Christians, notwithstanding those horrid abuses they are forced to endure, but without any Church or Priest; poor miserable Greeks, who, amidst that ignorance and oppression they labour under, retain the profession of Christianity still, though they have have forgotten their own Language and speak only Turkish." Khónáz, according to this writer, is eighteen miles South-East of Pambúk kulleh-sí, (so he names Hierapolis,) and about twenty miles North-East of Eskí Hisár. (Laodicea.) After crossing the River Sultán Emír, (Cadmus,) in his way from Denizli North-Eastward, Pococke (ii. 12. § 106.) reached, at the Northern foot of Mount Cadmus, a rock with a castle upon it, which, together with a village beneath, is called Canous. (Khónáz.) "This," he says, "was a strong hold of Soley Bey Ogle, (Sári Beg O'ghlí,) where he commonly dwelt, and had eleven cannons for his defence." It is supposed to be Colosse, to

the inhabitants of which St. Paul's Epistle is addressed. "All over the plain there are ancient water-courses, covered with an incrustation like that at Pambúk;" (Hierapolis;) but except some sepulchres and a lofty quadrangular mound, apparently an ancient fortification, he could see no trace of the former city. Eínái, or I'nái, together with Ishmeh, or Eshemeh, is a Kadílik with a weekly market to the East of Gókúyúk, South-West of Báflák, and nearly due South of Chál. It must therefore be on the Southern side of Ak-tágh, (Messogis,) not very far above the Mæander.

13. Sultán O'ní* is bounded on the South and East by Karah Hisár Sáhí, and on the North and West by Khudávendikár. Its Sanjaks are: Eskí Shehr; I'n óní, or Bóz úyuk; Bílejik; Sádí Ghází; Karákeh-shehr; Kal'eh-jik of Sultán O'ní; Ak Biyik. Eskí Shehr, the Capital of this Sanjak, in 39° 42' North and 30° 37' East, on the site of Dorylæum, a considerable town in an extensive plain, is divided into two parts, the upper and lower; the latter, in the plain near the warm baths, (I'íjeh,) in the neighbourhood of which are the sepulchres of Edeh-báli and Shihábu-d-dín Suherverdí, much frequented places of pilgrimage. (*Jihán numá*, p. 642.) Both the towns now consist (Kinneir, p. 38.) merely of miserable mud-houses, half of them in ruins. The four baths are not far from the Pursuk, (Thymbres,) which rising in the Northern extremity of the Aktágh, (Messogis,) passes by this city, and falls into the Sakáriyah, about sixteen miles North-East of it. At a village two miles from this city, there are other warm springs, on the surface of which an unctuous substance floats, resembling olive oil. About thirty miles South-East of Eskí Shehr is Sídí Ghází, an inconsiderable town half in ruins, with an old castle on a hill near the tomb of Sídí Ghází,† whence it takes its name. (Kinneir, p. 43.) It formerly possessed a celebrated Convent of the Begtáshí Abdáls, a highly venerated religious Order, and is the Santabaris of the Greeks. Sídí Battál, (*i. e.* Prince of Fighters,) one of the most renowned champions of the chivalrous ages of Islamism, fell in battle near this place, A. H. 122, (A. D. 740,) and like his namesake, the Campeador, soon became the hero of innumerable Romances. Sogúd, or Sógút, (pronounced Seuyút, according to the French orthography, and signifying a pasture, or an osier bed, hence called Sifsáf by the Arabian writers,) about thirty-four miles North-West of Eskí Shehr, and thirty miles South-East of Lefkeh, is celebrated among the Turks as the residence and burial place of Ertoghul. It is a small town near the Western bank of the Sakáriyah. This town, in 1800, (Leake, in Walpole, ii. 203.) was said to contain 900 houses, but it was in a wretched plight, an insurrection having been lately suppressed, and many of the inhabitants put to death. The town is enclosed by plantations of mulberry trees, and most of the inhabitants are silk-manufacturers. The kubbeh, or sepulchral chapel of Ertoghul, is on the top of an adjacent hill, surrounded by a grove of cypresses and holm oaks, and in style of architecture resembling the handsomest and most ancient at Constantinople. NA-
TOLIA.

about twelve miles nearly due South of Sogúd, is placed at the base of a perpendicular cliff. The abrupt termination of a chain of rocky mountains forms the Southern boundary of the plain, which is separated by a nearly parallel range from the valley of the Sakáriyah. The village has about 400 houses, and derives its name, which signifies "Cavern's front," from the many almost inaccessible and unexplored caverns in the hill above. It is venerated by the Turks as the residence of 'Osmán, and the spot from which he set out on all his victorious inroads upon the territories of the Greeks. Bóz-úyúk, (Snowy Peak,) at the summit of the ridge on the Northern side of the plain, is the place where the Seljukian Prince, 'Aláu-d-dín, Sultan of Kóniyah, (Iconium,) received the tidings of 'Osmán's great victory over his enemies at the pass of Ermení tágh, (Morene,) in memory of which he called this territory Sultán eunyí, (the Sultan's Van,) and assigned it to 'Osmán and his sons as the vanguard of the Royal army. Ak biyik Bába, (Father Grey Beard, named from one of 'Osmán's most valiant companions in arms,) North-West of Eski Shehr, and near the Southern side of Túmáníj, is a Kádílik also called Kúchuk Yúreh, to which the Kádíliks of I'n óní and Bóz úyúk are subordinate. On the Northern declivity of Túmáníj tágh (Olympus) is Bilehjik, a large and populous town, the head of a Kádílik, lying, says the *Jihán numá*, (p. 643.) midway between Burúsah, Yení shehrí, Lefkeh, (Leucæ,) Izník, (Nicæa,) Yalák ábád, and Kemlik, or Gemlik. At that place, and in the neighbourhood of Izník and Gemlik, there are manufactories of Brúsah cushions, mattresses for sofas, coarse woollen wrappers, ('abá,) and velvets, (kalífeh,) but inferior to those manufactured at Brúsah. Otter also observes, (i. 49.) that the wine made at this place is not bad. It is the Belocoma of the Byzantine Historians, and was taken by stratagem by 'Osmán, in A. H. 699. (A. D. 1299.) (Hammer, *Gesch.* i. 58.) On the Eastern bank of the Púrsúk, at a small distance from I'n óní, and about twelve or fourteen miles North-East of Kútáhiyeh, is Karájuh Shehr, or Hisár, (Blackish Town, or Castle, the Melangea of the Byzantine Historians,) taken by 'Osmán just before his father Ertoghul's death; in consequence of which conquest he was presented with a standard, kettle-drum, and horse's tail, (túgh,) the ensigns of command, by 'Aláu-d-dín, Sultán of Iconium, and thus made Viceroy of I'n eunyí, the cradle of his future Empire. About fifteen miles South-West of Sídí Ghází and nineteen South-East of Kútáhiyeh, is Tóghánlú, (i. e. Falconry, or Falcon-place,) near which there is an ancient fortress, Pismash Kal'ehsi, (Pismash Castle,) possibly Nacolea in Phrygia Epictetus. Adjoining to this village there is a most picturesque and romantic valley embosomed in a forest, and singularly diversified with rocks rising perpendicularly, and having the shapes of ruined towers and castles. (Leake in Walpole, ii. 207.) Some of them are upwards of 150 feet high, and one or two, entirely detached from the rest, have been excavated into catacombs. A little further on the South-East there are some sepulchral chambers formed with more art, having a portico in front, with two columns and a cornice; but the most singular of these monuments is one, the decorations of which are in a very unusual style, accompanied by inscriptions in a barbarous character, nearly approaching to the Etruscan, and therefore resembling the most ancient Greek; in one of the lines words are found which probably signify "To King Midas." These characters

bear some resemblance to those on the ancient sepulchres at Telmessus, and in other parts of Lycia and Pamphylia, (Walpole, ii. 524.) which have been so ingeniously deciphered by M. de Saint Martin, in the *Journal des Savans*, (1821, p. 249.)

14. "Bóli, in the centre of the Páshálik of Anátólí," says the *Jihán numá*, (p. 651.) is inhabited by the handsomest and most polished of all the Turks,* and is bounded on the South by Khudávendikár; on the West by Kójah-ílí; on the North by the Black Sea; and on the East by Kastamóni. Its Kádíliks are: Uskúbí; Eftení; Eflání, or Efnanlú, of Bóli; Aklaghán; Ahcheh shehr; Ak-tásh; Amásirí; Evlák dereh-sí; O'n íkí Díván; U'lús; O'vah yúzi; Bávelí, or Páulú; Bender Ereklí; Búrdur; Penj-shenbeh, or Zerzeneh; Bártán, or O'n íkí Díván; Teghen; Túdúrhah; Chághá; Chehár-shenbeh; Hisár óní; Dórt-Díván; Dergeneh Devrek; Zerzeneh; Za'frán in Bóli; Seráí Shihábu-d-dín; Samakó; Tiráklí Búrlí; Tiráklí Yenijeh; Kibrisjik, or Kubruschuk; Kiz-bíl; Kójur with Genjinús; Gereh-deh; Gókcheh sú with Gulbázárí; Módrení, or Módurní; Mengen; Vírán shehr; Yedí-Díván; Yilánlú-jeh; Yenijeh in Bóli; Yúrukán of Bóli; Yúrukán of Tiráklí. Bóli, the Capital of this Country, is not fortified, but is large and populous, has many public buildings, and thirty-two villages in its district. It is six days' journey from Istánból, in a fertile plain enclosed by mountains on the North and South, but open to the East and West, and famous for its excellent hazel-nuts called Fístí (Fistikí?) funduk, which are as good as almonds. On the South-East side there are natural warm baths. Its little lake full of fistulous roots, and its two springs, one of which petrifies, the other dissolves, are mentioned as worthy of notice by the *Jihán numá*. The word Bóli is a fragment of Hadrianopolis, the ancient name of a city, the ruins of which are about three miles from the site of the present town. (Sestini, *Voyage à Bassora*, p. 20.) Built on a slope, nearly in the centre of a plain surrounded by hills, Bóli is watered by a small stream which rises near the Yaílák of Módurní, and runs into the sea between the Kádíliks of Gul or Gól-bázárí, and Hisár óní. It is the Filyás of the Turks, and Billæus of the Greeks. Bender Ereklí, or Eregrí, as it is commonly called, in 40° 17' 51" North and 31° 26' 45" East, (Beauchamps in *Mém. sur l'Egypte*, ii. 165. 178.) is the Pontic Heraclea of the Ancients, in a charming situation, as may be inferred from Tournefort's wretched plate; (ii. 184.) its walls are in ruins, and except the traces of a pier, and a quay with broken columns and inscriptions, there are no relics of its former splendour. Cape Bába, a bold promontory, a little to the East of it, shelters its harbour, which still affords anchorage for large vessels, and is appropriated to one of the Imperial dock-yards of the Turks. About seventy-two miles West of Ereklí is Cape Kirpeh, (Calpe,) and not quite so far to the North-East is Amásirí, or Amásirah, (Amastris,) a hill forming a peninsula enclosed by walls in bad repair, and possessing two ports, of which the smallest, to the South of the castle, has the best anchorage. Within the circuit of the walls, and near the town, there are fine remains of ancient sculpture and architecture; the surrounding Country is covered with a luxuriant vegetation, and the inhabitants are peculiarly courteous and hospitable; so that few

places in Asiatic Turkey present a more advantageous field for the scientific traveller. (Beauchamps, *ib.* 161.) The largest river in this Sanjak is the Bártin, (Parthenius,) which discharges itself into the sea a few miles South-West of Amásiri. The most elevated and mountainous tract in Bóli, is the A'la tágh, (Beautiful Mountain,) on its South-Western confines. Many places in this Government are remarkable as being on or near the site of places noticed by ancient writers. Ge'iveh on the Sakáriyah is Protomacra; Tiráklí, Dablæ; Uskúbí near the Lake of Ifnánlí, Prusa on the Hypius; Dúzjeh, Duespra; Góineh, Canon Gallicanon; Kóstá Beg, Dadastana; Gerehdeh, Canis; Báindir, Potamia; Mó-durni, Modrenæ.

15. Kastemóni is bounded on the West by Bóli; on the North by the Black Sea; on the East by Jánik; and on the South by Kánkari. Its Kádílik is these: Aráj; Iztavái; Istefán; Afláni Dádái; Ak Kayà; Ak Yúruk; Ayándún; Bóyálí; Búi-ábád; Bermá with Bútán; Chanlik, or Chánlu; Haddih; Cheklineh; Khósh Alái; Dúrgání; Zári; Zerdeh vái; Sáhil; Sínób; Sherbán; Sarái; Sart; Súrún; Tásh Kópri, or Ak Yúruk; Túrhán; Kezil Agháj; Gerzeh in Kastemóni; Gúrehí hadíd; (*i. e.* Iron District;) Gúrehí nahás; (Copper District;) Gínól; Gókcheh agháj; Gólgúní; Merkúzeh; Yórtán; Yúrukán aráj. Kastemóni, the Capital, has Bázars, Mosques, Kháns, and many streets; and as Gúrehí nahás, *i. e.* the copper tract, is one of its districts, many copper utensils are manufactured there, and exported in different directions. Sínób is four days' journey to the North, and Engúri, (Ancyra,) five days' journey South-West. Kastemóni is the Capital of the Turkmáns, who are said to have conquered it from the Infidels. On a very high and inaccessible rock, on one side of it, there is a small castle. Gúreh, or the Copper District, is a town in a very elevated tract of hill and dale, one day's journey West of Kastemóni. It has four Mosques and many Baths, and its port is I'nehbóli, four hours (leagues) to the East. The Copper Mountains (Jebel ma'deni nahás) are a tract thirty miles in extent, where in certain places, at the depth of a mínáreh, (70 or 80 feet,) the copper ore is dug out of a red earth which has the appearance of being burnt. The annual produce of these mines is 10,000 batmáns, each batmán weighing nine ókahs, (25½ pounds avoirdupois,) and of these 3000 are allowed for expenses, and the remainder is paid into the treasury. "Be it known," says the *Jihán numá*, (p. 651.) "that the odour of this ore is destructive of the human body, and most of those employed in this business (of mining,) are slaves whom their masters have placed there from their infancy; they enter it therefore like dead men. Each has a piece of iron in his hand to rub the sweat off his forehead, for if they rub it off with the finger, or any other limb, their skin peels off. A bath is prepared for them every day at the extremity of the town; they go there to wash themselves, and get rid of their odious smell. Sometimes an extraordinary vapour issues from the mine, but if they say a prayer it is removed. Each miner carries an iron lamp filled with oil, and by the light of it they work. Much sulphur also is obtained from this mine." This description coincides singularly with that given by Strabo (xii. p. 562.) of Sandaracurgium, (*i. e.* the red arsenic works,) in or near Pompeopolis, in Mount Olgasys, not far from Sinopis. "The Sandaracurgium," he says, (xii. 3.40. p. 562.) "is a mountain hollowed out

by the great excavations made in mining. It was always worked on the public account, and the miners were malefactors, who had been sold as slaves in consequence of their crimes; for in addition to the laboriousness of the work, the air in the mines is said to be intolerable and destructive of health through the offensive smell of the ore, so that the miners are very short-lived. It often happens, moreover, that the mining is abandoned as unprofitable, for more than 200 of the workmen employed in it, are rapidly swept away by diseases and accidents."

Pompeopolis lay East by North of Kastemóni, as was discovered by M. Fourcade in a journey from Tósiyeh to I'nehbóli; (*Annales des Voy.* xiv.) for he found the remains of that city at Tásh kúpri, (Stone Bridge,) a small unwall'd town, and head of a Kádílik one day's journey from Kastemóni. On the coast to the North of Tásh kúpri, Kidrós, or Gidrós, the ancient Cyturus, in 41° 52' North and 32° 54' East, a few miles South-West of Cape Kerempeh, (Carambis,) in 42° 2' 1" North and 33° 19' 14" East. To the East of that cape, about twenty miles distant, is I'nehbóli, (Ionopolis, or Aboni mænia,) the port of Kastemóni, one hundred miles West of Sínób, a town comprehended in the Kádílik of Gúreh. It is situated in a valley between two mountains, and a river passes by it. There was formerly a castle in ruins on one of the mountains behind it. Injeh búrun, (Cape Slender,) the Northernmost point on this side of the Black Sea, in 42° 7' 55" North and 34° 56' 4" East, is about eighty-eight miles in a straight line North-East of I'nehbóli, and not more than eleven North-West of Sínób. That celebrated place, better known by its ancient name Sinopé, (Σινώπη,) lies in 42° 2' 16" North and 34° 41' 24" East, on a narrow sandy isthmus connecting a small island with the main land. On its Eastern side it has a spacious harbour, and on the top of the mountain called Bóz depeh, (Ice Hill,) which nearly encircles this little island, there is a fine spring which sends forth a stream, a circumstance the more remarkable, says the *Jihán numá*, (p. 649.) as there is no higher ground in its vicinity. The town is nearly quadrangular, and occupies the whole of the narrow neck of sand between the island and the main land. In the Old Mosque, there is a very remarkable pulpit of white marble richly sculptured, and, from the manner in which it is described, apparently some relic of Grecian Art, though probably a Christian monument of the Lower Empire. There are several other public buildings; and the island, which is hilly, is covered with gardens and vineyards. The various fortunes of this celebrated place, once the seat of the Eastern Empire, have been well, though very briefly, noticed by Tournefort, (ii. 202.) who justly complains of the negligence of modern Geographers in disregarding the accurate description of its peculiar position given by Strabo (xii. p. 545.) and Polybius, (iv. 57.) and also, though it was not known to him, by the Turkish Geographer. Its present fortifications, he adds, (p. 207.) are of the date of the Lower Empire. The adjoining burying grounds contain various fragments of Grecian sculpture, but no inscriptions could be found in or near the place. The Pontic wormwood (*Artemisia Pontica*) was the only remarkable plant which he discovered there. The Abbé de Beauchamps, who was detained at Sínób by contrary winds seven days in the Summer of 1797, had more leisure for research, and was more successful than Tournefort. "The castle," he says, "is more modern than the walls, and was

built by the Genoese." He copied a Greek inscription on an ancient cornice in its wall, saw a mutilated bust, at a great height on one of its towers, some bas-reliefs on the wall of the town near the sea in good preservation, a few cisterns large, deep, and solid, and parts of the walls of a vast public edifice. (*Mém. sur l'Égypte*, ii. 151.) The peninsula, about three leagues in circuit, is very fertile though bare of wood. The town is ill-fortified, and according to the estimate of its Aghá, had then only 500 inhabitants, principally Greeks, who, in Tournefort's time, were condemned to live in an unwall'd suburb. As all Christians are compelled to work for little or nothing in the Sultán's dock-yards, it is not surprising that the place should be deserted; especially as a want of bottom renders the launching of the ships peculiarly laborious and hazardous. The harbour, though spacious, is entirely open, and therefore very insecure.

16. Kian-
gari.Kiangari.
Gangra.

16. Kánkari, or Kánghári, is divided by the Kús-tágh into two parts, the larger of which is to the North of that mountain, between it and Elkás, and the mountains of Búdeh-nár. It is bounded on the West by Bóli; on the North by Kastemóni; on the East by the Sanják of Chúrú; and on the South by Engúrí. Its Kádílik are: Evgen, or O'ken; Bújúrvá, Bógház, or Cherkesh-Gúnbeti; Tókhat; Cherkesh; Sha'bán úzi; Tósiyah; Kárigí; Kári bázári; Karahjah-Vírán; Kal'eh-jik; Kal'eh-jik Keskin; Kóch-hisár; Kúrshúnli; Kóri bázári; Mílán; Yenijeh-kóí. Kánkari, Capital of this Sanják, is on the Southern side of Kús-tágh, on the declivity of a recess in that mountain, opening to a plain on the South-East. It is a populous town of a moderate size; most of its houses are built of timber and have tiled roofs. The Royal Palace, inhabited by the Governor, is on a hill towards the plain, opposite to the castle, and apart from the town. Around it are the houses of his attendants and domestics. Its castle is a strong fortress, built by the Infidels on a mountain above the city, and completely commanding it. It is placed on a very bold and lofty rock scarcely accessible to beasts carrying burdens, and contains a Mosque and some streets, besides the habitations of the Dizdár (Castellan) and his followers. They are supplied with water by a very large and deep reservoir hewn out of the solid rock, at the bottom of a well closed by an iron gate. In case of a siege there is never any want of water. The rock, whence this reservoir is hewn, being of one piece with that on which the town is built, they have made a staircase like that of a mináreh, one or two miles in depth, to the level of the town. Midway there is a reservoir, likewise hewn out of the rock, and they found a water-course running lengthways from one side of the reservoir to the other; it becomes of some width, and having passed by the shaft sunk in the rock, as mentioned above, issues from it. The people of the town say that this stream is a branch of that which passes from beneath the place. In the hot season some of the inhabitants and chief persons (*a'yán*) of the town go down into that deep well with torches, and have kebábs and other meats dressed there. From one side of the plain between the town and the river, (Bahr,) there flows a stream of fresh water called Karah Sú, (Black Water,) and from another side, a second called Ají sú, (Bitter Water,) which uniting, one or two miles below Kánkari, flow into the large river called Kizil I'rmák, (Red River,) after a course of a few hours' distance. The Ají sú passing by the salt-mines at the

Kara sou.

Adgi sou.

distance of three hours (nine miles) to the East of the Kánkari, its water becomes bitter. Engúrí is three days' journey South; Cherkesh two days' journey West of Kánkari, and its port, Sínób, is six days' journey distant. Kánkari, or as it is pronounced Kyánghári, exactly corresponds with the position of Gangaris in the Pentingerian or Theodosian Table, which is evidently a corruption of Gangra, or Gangræ, celebrated in Ecclesiastical History on account of the Council held there about the middle of the IVth century, the canons of which condemn an excessive reprobation of marriage. (Labbe, *Collect. Concil.* and Baronius, A. D. 361.) The salt mines already mentioned, are in a low hill entirely devoid of herbage, near the village called Túzlú, (Saline,) four hours to the East of Kánkari. The soil is here entirely saline, and excellent rock salt is found wherever they dig. (*Jihán numá*, p. 648.) This Sanják, as before remarked, is divided into two parts by the Kús tágh (Magaba) mountains which run from East to West, are covered with forests of pine and thuyas, and abound in running streams. Opposite to this chain is Elkás, or Olkás tágh, (Olgassys,) on the Northern extremity of the Sanják. The River Devrek, or Devres, (Dorek, or Doros, in Rennell, ii. 117.) rising near Kári-bázári at the Western extremity of Kús-tágh, running for the most part from West to East, and passing near Cherkesh, Kúrshúnli, Kóch-Hisár, and Tósiyyah, joins the Kizil I'rmák between Kárigí and a deserted village called Háji Hamzeh. The second town in this Sanják is Tósiyyeh, (Docea,) on the Northern side of Kús-tágh, at some distance from it and opposite to the more arid and terrific Elkás, (Sestini, ch. iv. p. 35.) placed on the declivities of an extensive valley. It has many Mosques, Baths, and Kháns, with a Chárshú, (Market,) and contains more than 2000 houses inhabited by Turks and Armenians. There is a castle of little strength, built of mud, on a very elevated spot near the summit of the mountain. On its South-East side this town overlooks an open plain bounded by the Devrek, or Devres, flowing near it, and the skirts of the Kústágh behind. The town is abundantly supplied with water from Elkás, as well as from Kús tágh, and the *Jihán numá* (p. 646.) expatiates upon its fountains adorned with richly sculptured marble, as well as its splendid Mosques and Kháns. Tanning, weaving of cotton cloths, and the forging of iron tools are the principal trades carried on here. Cherkesh, near the Western boundary of this Sanják, is a town situated in an extensive plain, with a low castle built of small stones, several streets, many fountains, and a Mosque, Khán, and Baths, built by Murad IV. (about A. D. 1630.) It is now little better than a fortified village, remarkable for its white and excellent honey. Sestini (p. 29.) saw a Greek sepulchral inscription of no importance near one of the gates. A small river passes by it running Westward, and falling into the Mílán, after having passed through the narrow defile called Hammál-lú Bógház, or Cherkesh Kumbetí, (Porter's Town Defile, or Bowl of Cherkesh,) a Kádílik of low degree containing seventeen villages in a tract of hill and dale, on the confines of Bóli and Kánkari. The village of Hammál-lú, so named because it is the native place of most of the porters who ply at Constantinople and Smyrna, is near the Western extremity of the Bógház on the Mílán, (Bilis, Sestini, p. 28.) which falls into the Bártin. NA-TOLIA. passes, is a Kádílik containing thirty-five villages; it is nearly due South of the Kádílik of Mílán. Its Kádí resides in a large village named Kúprilú. (Bridge Town.) Here is an extensive forest and mountainous tract inhabited only in Summer, (Yaílák,) called Mezlivá, lying on the North side of the greater part of the River Devres.

Keupruli. Tókhat, on Kús tágh, and South, a little to the East, of Kánkarí, midway between Tósiyyeh and Kóchhisár, on the opposite (*i. e.* the North) side of that mountain, is placed on a very elevated but level and fertile spot surrounded on three sides by mountains. Karahjah vírán (Blackish and Desolate) is mentioned by the *Jihán numá* (p. 647.) as a town on the King's High Road, to the West of the Kádílik of Bújúrvá, having Mosques, Baths, and Kháns. It is on level ground surrounded by corn-fields. This level, however, appeared to the Abbate Sestini (p. 30.) bare and sterile; and the mountains in front, as he advanced Eastward, seemed to be extinct volcanoes. Lava appeared on isolated peaks: and a yellowish soil with long sulphureous furrows, and blackened stones scattered about, were indications of volcanic action. In the village of Karahjah Vírán, the Abbate found fragments of lava. It is in fact built of that substance, whence it has received its name, and has a close resemblance to the villages on the flanks of *Ætna*. It is on the side of a hill in a defile through which a stream runs, (probably to join the Devres,) on ascending which, for an hour and a half, Mr. Sullivan and he found a succession of volcanic substances exactly similar to those ejected by that mountain: the summit of the hill, which may be an hour's walk higher up, they could not reach, and consequently did not see the crater of this volcano.

Tókhat. About twelve miles East of Karahjah Vírán is Kóchhisár, (Ram, or Hero Castle,) a town in a plain. It has Markets, Baths, and Mosques, especially a large one (*jámi*) built of timber, with a Court of Justice, on very level ground apart from the town, where a large market is held every Friday. There is also a castle built of clay, separate from the town; and the ground between them is laid out in very productive gardens.

Caradge wiran. A stream from the skirts of Gók tágh, (Heaven's Mount,) running beside the high road to Tósiyyeh, here enters into the River Devrek, (or Devres,) which passes near this town. This river is called Gók súi, (Heaven's Water,) and is fordable. (Sestini, p. 34.) The whole country between this place and Tósiyyeh is hilly and rugged, and the heights are covered with pines and thuyas, while the fragrant elæagnus, which is here a considerable tree, shades with its silvery foliage and fills with its powerful odour all the lower tracts near the river and its tributaries from the hills.

Extinct volcano. 17. "Engúrí, otherwise called Enkureh, was anciently called 'Ammóriyá, from a city near it, (lying North of Kóniyeh,) which was taken and destroyed by Hárún el Rashíd, and of which there are now," says the *Jihán numá*, (p. 643.) "no traces remaining." This Sanják is bounded on the North by Tósiyyeh and Chúrú; on the East by Kír Shehr; on the South by Ak-serái; and on the West by Eski Shehr and Khudá-vendikár. Its Kádíliks are: Enkureh; Yúrukán; Ayyásh; Báji; Chibúk-ábád; Chukúrjuk; Shórbá; Murtezá-ábád; Yabán-ábád; Háimáneh; Yer kói; Górei, or Kórel. Enkúrí, its Capital, is a Móllálik of 500 aspers, and is sometimes given as an Arpehlik (extra allowance) to a Kází-asker who has been displaced. "This city has an outer and an inner castle, a

Cotch hissar, or Codje hissar.

Kazás.

Enkúrí. Angora. Ancyra.

Bezestán, Markets, Mosques, and Baths, and several wards, or streets. Outside of it there are a few plantations, gardens, and vineyards, and it is watered by a small river; most of its inhabitants are Turkmáns. Its principal article of commerce is tiftík (mohair yarn) and wool, which is not found of the same degree of excellence elsewhere. The inner castle has a very elevated position, and is exceedingly strong; the outer fortress being on level ground, is not so; all the houses are within the walls. This city was built by Constans Cæsar, and taken by Hárún el Rashíd, Mámún, and others. It is five days' journey from Kastemóní. The two folds of its gates were carried away by Hárún to Baghdád. It was taken A. H. 762 (A. D. 1361) from Akhíler, by Murád the Conqueror, son of O'rkhan. The charming gardens called Kayyásh, the Convent of Husein Ghází, on the bank of the river named Kayyásh súi, and on very high ground immediately above Enkúrí, with the Sepulchre of Háji Beirámí, who died A. H. 876, (A. D. 1471,) and was founder of the Religious Order bearing his name, are among the extraordinary things to be seen near this city; but the most extraordinary is the well in a ruined Church near the Kizil Irmák, to the East of Engúrí. It has no water; and is called Deliler Koyúsi. (Madman's Well.) When they lead a madman in his winding-sheet to this well, and make him look into it, he either dies or is cured of his malady. This is so well known to the people of Engúrí, that there is a large burying ground near this well called Madman's Cemetery. (Deliler Mezári.) If a man in his sound senses look into it, he sees nothing, and sustains no injury, but merely smells an odour resembling the smell of sulphur." "Angora is at present," says Tournefort, (ii. 452.) in A. D. 1701, "one of the finest cities of Anatolia, and every where bears the marks of its ancient magnificence." Almost every house and wall is crowded with fragments of columns or sculptured marble. The inscriptions, at that time extant, were very numerous, and several of them were copied by him. The castle, he adds, has a triple enclosure, and in the first there is an Armenian Church, dedicated to the Holy Cross, and said to have been built in the VIth century. It is lighted by only one window, and that is filled with a square piece of transparent marble, similar to alabaster, but having a reddish tint. The most remarkable relic of antiquity at Angora is the vestibule of a splendid Temple erected in honour of Augustus. (Belley, in *Mém. de l'Acad. des Inscriptions*, xxviii. 391.) Its walls were from thirty to thirty-five feet high when Tournefort saw it, with a doorway twenty-four feet high, and nine feet two inches wide; the masonry being all formed of very large blocks of polished marble. On each side of the entrance are the famous Latin inscriptions containing a summary of the history of Augustus; but some Greek inscriptions on the outside are rendered illegible by the smoke from chimneys immediately beneath. Happily the Latin inscriptions were transcribed in the XVth century by a learned Italian Prelate, who was Ambassador from the Emperor of Germany to the Porte, or the Monument of Ancyra, (Monumentum Ancyranum,) which, as an historical record, is of great importance, might have been entirely lost, for it is now too much injured to be restored with certainty. The height, beauty, and striking appearance of Angora; the great elevation of the perpendicular cliff on which its castle is built; its extensive outworks on the adjoining heights; the remains of an Amphitheatre, said to exist on the North-West side; the

NA-TOLIA.

Madman's Well.

Armenian Church.

Temple of Augustus.

NA-
TOLIA.

ruins and inscriptions on the Temple of Augustus, are all noticed by Mr. Browne, (*Trav.* p. 495.) who visited the place in 1797. The people, he says, are the most polished in Anatolia; a peculiarity easily accounted for by the extensive commerce of the place, where for a considerable time European factories were established. The population is estimated by Tournefort (ii. 463.) at 40,000; one-tenth Armenians, and not more than one-seventieth part Greeks. "Angora is one of the neatest cities I have ever visited," says Mr. Browne; (p. 497.) "its streets are paved with large stones but without footpaths." Its walls and houses are built for the most part with lava, if Sestini's opinion (*Viag. a Bukoresti*, p. 81.) be correct, and the hill on which it stands is volcanic. "The soil of this district is," according to Mr. Browne, (p. 497.) "a fine red marl; but there is no peculiarity so striking in the site, soil, or air, as to offer any probable induction concerning the origin of those two remarkable breeds of animals, (the Angora cats and goats,) so dissimilar from those of other regions of the East." "Galatia," says Sestini, (p. 94.) by which he appears to mean the Livá, or Sanják of Engúrí, "is now divided into seven districts: * Ayásh; Yabán O'va; † (Yabán ábád;) Murtád-ová; (Murtázá ábád;) Chibúk-ová-sí; (Chibúk ábád;) Chórbá-bázár; (Shórbá;) Yókári Kasabah; (Upper Town;) Ashághí Kasabah. (Lower Town.) The whole Province is an assemblage of hills and mountains, rarely intercepted by plains, all bare and naked, with little or no wood, except in Yabán O'va. Beside the Sakáriyah and Kizil I'rmák, its natural boundaries, this tract is watered by the Istánós, I'lán súi, Kirmír, Chibúk-ábád, Engúrí, and Injeh-súí. The whole produces excellent pasturage; the climate is extremely good; little rain, but much snow, and drying winds in Winter, refreshing breezes from the North in Summer, and rarely South winds; the rain almost always moderate. The country most favourable to the sheep extends about fifty leagues from East to West, and ten from North to South, being bounded by the Kizil I'rmák. Sestini thinks, with reason, that it is the dryness and elevation of the country on the declivity of Elmá tágh, (Adoreus?) to the West of the Kizil I'rmák, which occasions the entire discrepancy between the breeds of sheep and goats on that side of the river, and those on the moist and boggy plains which lie to the East of it. To the West of the Sakáriyah, moreover, where the country is hilly, the fleeces, though inferior, approach to those of the true Angora breed. The dryness of the soil and atmosphere, both in Winter and Summer, and the cold to which the cattle are exposed in the former season, may therefore be considered as the principal causes of the peculiar length and thickness of their fleece. Nor is this peculiarity confined to the cat and goat; for the dogs, hares, and lynxes of this country are all remarkable for the thickness and length of their fur. Salt is given to the sheep and goats every day; they are shorn once a year, in April, and the fleeces from Beg-bázár, West of Engúrí and the Yúruk (Nomade Turkmáns) of Háimáneh, on Elmá tágh, nearly due South of it, are considered as the best. The fine yarn is spun by women, and only in Angora, twenty

Angora
goats and
wool.

* Ajalet, according to Sestini, by a strange mistake; for Eyálet is the Arabic equivalent to the Turkish word Páshálik, or Vice-royalty.

† O'va is evidently a popular corruption of the Persian ábád, (town,) for there are scarcely any plains (ová) in all this tract of country.

drachms being the largest quantity of the finest sort that one woman can spin in a week. The exportation of the finest thread is prohibited, in order to secure it for the use of the native weavers. Angora and Istánós, an Armenian village, six hours (leagues) distant, are the places where the shawls (*shál*) and camelots (*sóf*) are woven. In 1787, the export to Europe did not exceed 2000 bales annually, the principal part of which was purchased by the French. It paid a duty of sixteen aspers (eight párahs, about 10*d.*) per ókah, (two pounds and a half.) The weavers are all men, and principally Armenians, and the shawls measure thirty endázehs (pechys in Greek, *i. e.* cubits) long and one broad. Inferior shawls are manufactured at Ayásh, to the West of Angora; but the finest sorts only in that city, their manufacture elsewhere being prohibited. Very coarse ones are made in Tósiyeh and Kóch-hisár to the East of Angora, but they sell for a very small price. Camelots, twenty-five endázehs (cubits) long and one and one-eighth broad, are also made at Angora: the finest only on particular orders. When watered, they are used by the Turkish Grandees for full dress on gala-days; and when died black, by the dignitaries of the Greek Church. Forty thousand pieces are said to be woven annually. The exportation of the goat skins is strictly prohibited. The position of Angora has not yet been accurately determined; the Chevalier Lapie places it in 40° 2' 30" North and 33° 3' 54" East, but doubtless too far North and East. Major Rennell (ii. 261.) gives 39° 50' North and 32° 45' 30" East as its position, from Mr. Browne's and other Itineraries. The rich pastures of Galatia will supply the Botanist with abundant treasures, (Sestini, p. 118.) and among other rarities produce the *Dodartia* and beautiful *Morina*. The Arabs seem to have confounded this city with Amorium, which lay between eighty and ninety miles to the South-West. Its ruins are said still to exist at Bálá bázár, or Balkásiyyeh, about six miles South-East of Sivrí Hisár, near the road from Engúrí (Ancyra) to Karah Hisár. (Metropolis.) Ayásh, already mentioned, nearly due West of Engúrí, is about fifteen miles East of Beg bázár, near which runs the River Kirmí, or Kirmír, in its way to the Sakáriyah. Murtázá, or Murtadá ábád, is a town in a plain contiguous to the district of Engúrí Proper, on its West side. It is the head of a district containing several villages inhabited by spinners of goats' wool. (Mohair yarn.) Beg bázárí, to the West, Gúrel or Gúdel to the South, and Yer kóí to the North of Ayásh, are all near it and subordinate to its jurisdiction. Near Beg bázárí, on its Eastern side, there are warm medicinal baths of great use to the sick; Yabán-ábád, (Desert Town,) to the South of Ayásh and North of Shórbá, is a town and Kádílik in the mountains. Shórbá, near to Geredeh, and North of Ayásh, is a Kádílik, without any town, established in the Summer quarter (Yailák) of the mountains (of Báindir,) which abound in pine-forests, and have excellent air and water, and in some places warm baths. Chibúk ábád (Tobacco-pipe Abode) is a town and Kádílik North-East of Engúrí, and East of Chukúrjúk, (Little Pit,) which is one day's journey East of Engúrí, on the declivity of Elmá tágh, (Apple Mountains, Adoreus,) the heights of which are well watered and wooded, and afford an excellent Summer abode. The Yúrukán (wandering hordes) of this Sanják form a separate Kádílik, whose Kádí is continually moving from one town to another, in order to settle their law-suits, and has no fixed abode. Háimá-

neh, to the South of Chukúrjuk, and on the declivity of Elmá tágh, belongs to the district (*náhiyeh*) of Engúrí, and is one of the Sultán's Peculiars. It extends as far as Túrghúd-ílí, and contains a very celebrated warm source, into the mud of which, if a sick man plunge himself, he finds a cure. The inhabitants of Háimáneh and Túrghúd-ílí, most of whom are engaged in rearing an excellent breed of horses and camels, are remarkable for their hospitality and kindness to travellers. The fruits in the country about Engúrí are so abundant, says the *Jihán numá*, (p. 644.) that of pears alone there are six and thirty different sorts, some of them, as for example, the Bey emrudí, (Prince's pear,) of unrivalled excellence.

An account of the remaining Páshálíks of Natolia or "The East," in its largest acceptation, is reserved for the head of SIVAS; as the facilities now enjoyed by travellers in Turkey encourage the hope of large accessions to our information respecting that Country, of which, at present, scarcely any thing is known beyond the most frequented routes.

NA'TURALIZE, } elder writers as equivalent to,
NATURALIZA'TION, } *nature*: according to or against
NA'TURALIST, } *kind*; is, according to or against
NATURALITY. } *nature*; unkind, unnatural.

Nature is very variously applied:

To the aggregate of qualities inherent from the birth or creation of any thing; forming or constituting its being, essence, or existence; its kind or species.

To the Author or Creator of the World.

To an imaginary Being framed by the personification of the qualities constituting or composing the universal World.

To the established course or order of the phenomena or appearances of the Universe.

To the system of animal and material being.

More specifically, to the sensations or passions of animate Beings.

To the sensible qualities of materiate Beings.

Nature is opposed to Art.

To *naturalize*; to invest with *native* or *natural* qualities; to grant the rights or privileges of a *native*, or one born in a Country.

If gentillesse were planted *naturelly*
Unto a certain lineage down the line,
Prive and apert, than wol they never fine
To don of gentillesse the faire office,
They mighten do no vilanie or vice.

Chaucer. *The Wif of Bathes Tale*, v. 6716.

He whiche *natureth* euery kynde
The mighty god, so as I fynde
Of man, whiche is his creature
Hath so deuyded the *nature*:
That none tyll other well accordeth.

Gower. *Conf. Am.* book vii. p. 206.

VOL. XXV.

And thus seyth the *naturien*,
Which is an astronomien.

Gower. *Conf. Am.* p. 208.

Of hem that bene magiciens,
Right so of the *naturiens*.

Id. *Ib.* book vi. p. 194.

Cham, whose labour is yet in mynde,
Was he, whiche firste the letters fonde,
And wrote in Hebrewe with his honde
Of *naturall* philosophie.

Id. *Ib.* book iv. p. 113.

Naturall reason must bee ruled by scripture. If *naturall* reason conclude agaynst the scripture, so is it false; but if it be agreeyng to scripture then is it to be heard.

Frith. *Workes*, fol. 7. *Answers vnto Rastell's Dialogues*.

The goddis by their *naturalitie* and power, close vp the furies,
and gouerne the steares.

Golden Boke, sig. G. g. 3.

But he that sinneth (as they all do which do vniustly for fauour and pleasure of men) is of the Deuil, (saith hee,) which once all our partaking and *naturall* iustices bee with all their partialitie and *naturalitie*.

Fox. *Martyrs*, fol. 1594. *Letters of M. Latimer*.

For syth he wrought it not *naturallye* but willingly, he wrought it not to the vttermost of his power, but with such degrees of goodnes as his hye pleasure lyked to limit.

Sir Thomas More. *Workes*, fol. 129. col. 2. *A Dialogue concerning Heresies*.

Euery man *naturally* desyreth to go into their owne coütres, and to here therof.

Lord Berners. *Froissart*. *Cronycle*, vol. i. ch. 332. p. 520.

Nature then (according to the opinon of Aristotle) is the beginning of motion and rest, in that thing wherein it is properly and principally, not by accident: for all things to be seen (which are done neither by fortune nor by necessity, and are not divine, nor have any such efficient cause) are called *naturall*, as having a proper and peculiar *nature* of their own.

Holland. *Plutarch*, fol. 659.

It is with depraved man in his impure *naturalls*, that we must maintaine this quarell.

Hall. *Works*, vol. iii. fol. 434. *Saint Paul's Combat*.

So farre as the Spirit of God is above reason, so farre doth a Christian exceed a meere *naturalist*.

Id. *Ib.* vol. i. fol. 23. *Meditations and Vowes*. Cont. iii. 34.

Yea let mee but know what action Popery requires of any other followers, which a meere *naturalist* hath not done, cannot do?

Id. *Ib.* vol. i. fol. 293. decad. iii. epist. 3.

3 M

NATURE.

—
NATURALIZATION.

Though they [Spaine] have not had that usage to *naturalize* liberally; yet they have that, which is next to it: that is, to imploy, almost indifferently, all nations in their militia of ordinary souldiers. *Bacon. Essay 29. p. 177.*

Therefore all States, that are liberall of *naturalization* towards strangers, are fit for empire. *Id. Ib.*

This cannot be allowed, except we impute that unto the first cause which we impose not on the second, or what we deny unto *nature* we impute unto *naturity*. *Sir Thomas Brown. Vulgar Errors.*

Our little world, the image of the great,
Like that, amidst the boundless ocean set,
Of her own growth hath all that *nature* craves,
And all that's rare, as tribute from the waves.

Waller. On a brede of divers colours.

It is disputed, I know, in *natural* philosophy, whether the sense being duly qualify'd, and the object as duly proposed, and the medium fitted to both, the sense can be deceived in the apprehension of its object; and it is generally held in the negative.

South. Sermons, vol. v. p. 174.

Naturalists observe that when the frost seizes upon wine they are only the slighter and more waterish parts of it that are subject to be congealed; but still there is a mighty spirit, which can retreat into itself, and there within its own compass lie secure from the freezing impression of the element round about it.

Id. Ib. vol. ii. p. 474.

And to show the *naturalness* of monarchy, all the forms of government insensibly partake of it, and slide into it.

Id. Ib. vol. iii. p. 482.

But to call the earth the lower part of itself, is an apparent violence to the *naturalness* of the expression, and indeed not more forced than ridiculous.

Id. Ib. vol. vii. p. 7.

Those that admit and applaud the vulgar notion of *nature*, I must here advertise you partly because they do so, and partly for brevity's sake, I shall hereafter many times call *naturalists*.

Boyle. Works, vol. v. p. 168. A Free Inquiry into the received Notion of Nature.

Naturalists have built immense systems of imagination on a few sensible phenomena inaccurately observed very often, and not always very fairly recorded.

Bolingbroke. Works, vol. vii. p. 37. Authority in Matters of Religion, ess. 4. sec. 24.

He [Lord Bolingbroke] was of that sect, which to avoid a more odious name, chuses to distinguish itself by that of *naturalism*; and had boasted in private, what feats he should be able to perform, in the attack he had long threatened on all our metaphysics and theology; in other words on *natural* and revealed religion.

Hurd. Life of Warburton, vol. i. p. 61.

If I succeed in *naturalizing* to any degree authors, whose names only float amongst us, I shall not think that what has been the heaviest part of my undertaking has been the most unprofitable.

Observer, No. 2.

Toto was afterwards sergeant painter, and in Rymer are his letters of *naturalization* under this title.

Walpole. Anecdotes of Painting, vol. i. p. 93.

NATURALIZATION, in *Law*, is the act of investing an alien with the privileges, and imposing upon him the obligations, of one who is born within the dominions of the Crown of England. This can be effected only by an Act of Parliament. It is provided by Statute 12 William III. c. 2. that a person Naturalized shall be incapable of being a Member of the Privy Council or of either House of Parliament, of holding any office of trust Civil or Military, and of taking any grant of lands, &c. from the Crown. It is also provided by Statute 1 George I. c. 4. that no Bill of Naturalization shall be received in either House of Parliament, without such disabling clause; and by 14 George III. c. 84. that no such Bill be received without a clause disabling the person from obtaining any immunity in trade thereby in any foreign Country, unless he shall have resided in Britain for seven years next after the commencement of

the Session in which he is Naturalized, and shall not have been absent during that time for a longer space than two months. The person is also required to take the oaths of allegiance and supremacy; but now by Statute 6 George IV. c. 67. the taking of the Sacrament of the Lord's Supper is dispensed with. The disqualifying clauses are usually dispensed with in favour of foreign Princes and Princesses. See 56 George III. c. 12 and 13, by the first of which it is rendered legal to bring in a Bill without the disqualifying clauses to Naturalize Leopold Prince of Coburg, and by the second the Prince is Naturalized accordingly.

A Naturalized person differs from a *Denizen*: *Denization* being effected by Letters Patent, and the *Denizen* being incapable of taking lands by descent, a privilege which is conferred by Naturalization, together with every other privilege of a Natural-born subject, except those which, as mentioned above, are specially excepted. See Blackstone, *Commentaries*, vol. i. p. 366, *et seq.*; Coymn, *Digest, Alien and Denizen*; Bacon, *Abridgement, Alien*.

NAVARETTA, in *Botany*, a genus of the class *Pentandria*, order *Monogynia*. Generic character: corolla funnel-shaped; stigma two-cleft; capsule membranaceous, one-celled, two-valved.

One species, *N. involucrata*, native of Chili.

NAVARRÉ, one of the fifteen Provinces into which Spain is divided, and bearing in the documents of the State the title of Kingdom, is bounded on the North by France, East by the Kingdom of Aragon, South by Old Castile, West by Alava and Guipuzcoa, and has a superficial extent of 4500 square British miles. Its frontiers are of great natural strength, being formed on the North by the crest of the Pyrenees, on the East by a rugged ridge extending Southward from that great chain, and overgrown with thick forests; on the South by the Ebro, the rapid stream of which is in a few places fordable; and on the West by the high and steep mountains of Guipuzcoa. The highest mountains within the Province are the Altoviscar of the altitude of 5380, the Adi of 5218, the Alcorrunz of 3348 feet. The surface is in general mountainous, and the most valuable and fertile tract is a wide but uneven valley, on three sides enclosed within the ranges extending along the frontiers, and open to the South, in which direction it forms successive terraces, or narrow table-lands, gradually becoming lower towards the Ebro. The range forming the Northern frontier, is in several places indented by deep valleys well known, both in former Ages and at present, as the channels of communication between the Peninsula and the rest of Europe, and the war-paths between the neighbouring and often hostile nations of France and Spain. The most frequented of these passes are Roncesvalles, Val Carlos, and Echalar.

With the exception of the Vidaso (Bidassoa) which falls into the Bay of Biscay, the channels draining the surface of Navarre discharge themselves into the Ebro. The principal of these tributaries is the Aragon, which, rising in the Kingdom of the same name, crosses the Eastern frontier of Navarre, through which, with a considerable volume of water, it runs the rest of its course, a distance of about eighty miles. The Arga rises in the Pyrenees of Navarre, flows by Pamplona, and after a course of about one hundred and twenty miles falls into the Aragon, a little above its mouth. The Ega rises in Guipuzcoa, crosses the Western frontier near Zunig, and after a course of about one hundred miles falls into the Ebro

near Uzagre. These rivers abound in excellent fish, and might, with little expense and labour, be made the channels of extensive inland navigation, and the means of incalculable benefit to the Country in consequence of the facilities which they afford to irrigation; but want of skill and capital has hitherto prevented their application to such purposes.

The climate is in the Northern and elevated region damp and cold, in the Southern and lower remarkably mild, equable, and salubrious. The rough and mountainous tracts in the Northern and middle parts of the Province are computed to constitute three-fourths of its extent. The higher parts of the mountains are left uncultivated and nearly relinquished to the numerous wild animals which haunt them. The game there is usually wild swine, deer, chamois, and hares of remarkable size. The rapacious quadrupeds are, bears, wolves, foxes, and wild cats, attaining a size and strength which render them very destructive to the flocks of the neighbouring valleys, and dangerous when attacked by the hunter. The lower parts of the mountains afford good pasture, and the attention of the people is principally directed to this department of rural industry. The Southern and more level part of the Province is fertile, and the cultivation is generally directed to the growth of grain, of which the principal crop is wheat.

The Bardenia Real, a tract on the left bank of the Ebro, has a very rich soil, but in consequence of deficient irrigation, its productiveness is far less than might be expected from its natural fertility. The annual average amount of the corn crops of Navarre is stated by Miñano at 460,000 quarters, of which 160,000 are of wheat, 90,000 of barley, 40,000 of maize, 40,000 of oats; in addition to these pulse are extensively cultivated, of beans 8000 quarters, kidney beans (*phaseolus*) 5000, and of chestnuts, which form an important article of diet, there are on an average 5000 quarters annually gathered. The vintage yields 1,400,000 gallons of wine, and 20,000 gallons of vinegar. The annual produce of flax is 8600 hundred weight, and of hemp 26,000 hundred weight. The live stock was found on enumeration to consist of horned cattle 48,242, horses and mules 25,759, sheep 630,000, hogs 31,758, goats 69,500. Much of the surface of the mountains is covered with timber of the most useful kinds, which would prove a source of wealth to the proprietors, but that the difficulty of carriage renders it of little value. The manufacturing industry of this Province is, as might be expected, very insignificant, being confined to a few factories for soap, linen, paper, and coarse woollens. The mountains, besides excellent building-stone and slate, contain jasper and various kinds of marble, copper and iron in great quantities, and rock salt. Miñano estimates the fixed and circulating capital of the Province at £1,187,989.

The population amounts to 271,000 individuals, remarkable among the Spaniards for industry and integrity, and like most mountain races addicted to emigration in quest of subsistence or fortune. Their character is justly estimated so highly, that there is a greater number of Civil and Military officers selected from the natives of this Province than from those of any other.

There are two Bishoprics, Pamplona and Tudela, containing 753 Parishes, and in addition to the same number of incumbents, there are 1166 secular Ecclesiastics, 1120 regular, and 510 nuns.

The Government is administered by a Viceroy resident

at Pamplona. The Province is divided into the five following *Merindades*, or districts.

Chief Towns.		Population.
Pamplona.....	Pamplona.....	15,000
Estella.....	Estella.....	4,600
Tudela.....	Tudela.....	8,000
Olite.....	Olite.....	3,000
Sanguessa.....	Sanguessa.....	2,500

Pamplona, the Capital, has at a distance a striking appearance in consequence of its well-chosen site and extensive citadel. The visitor is disappointed on entering the town as the streets are narrow and crooked. They are, however, well paved and lighted, and remarkably cleanly; numerous sewers discharge all filth into the Arga, and in addition to the water which that stream affords, an aqueduct conveys an abundant supply from Mount Subiza distant three leagues. Pamplona is a Bishop's See, and has four Churches besides the Cathedral. There are seven Convents for male, and two for female Cenobites. It is of much importance as a military position, being the principal defence of Castile against invasions from France. The citadel, built in the reign of Philip II., is a regular pentagon, measuring three hundred and thirty yards along each side, and has five strong bastions communicating by means of covered ways. It has an arsenal, hospitals, good quarters, and all other accommodations requisite for a numerous garrison. Latitude 42° 45' North, longitude 1° 30' West.

Tudela is a Bishop's See, and besides the Cathedral has four Churches, and six Convents for male, and four for female Cenobites. It is a very ancient town, as many of the houses were built by the Moors previously to 1114, when it fell into the hands of the Christians. According to the Saracenic style of building, the streets are narrow, and the houses lofty and massively constructed, and furnished generally with fountains and baths. The Ebro, here four hundred yards wide, is crossed by an ancient bridge of seventeen arches, a monument of Moorish civilization and skill, for it existed previously to the conquest of the town by the Christians. Latitude 42° 10' North, longitude 1° 44' West. The other towns of the Province contain nothing meriting particular notice.

The greater part of Navarre, subdued by Charlemagne in 778, revolted against Louis the Debonaire, and in 831 chose Aznar for King, whose descendants enjoyed the Royal dignity until its conquest by the Christian Spaniards in 1114. Sancho VII. dying without issue in 1234, his dominions passed to Thibaud Count of Champagne, in right of his consort Blanche, the sister of the deceased Prince. The Counts of Champagne retained it till 1285, when it fell under the dominion of Philip the Fair of France. It subsequently by marriage came into the possession of the House of Evreux, from which it passed to the King of Aragon, and in 1483 was acquired by Francis Count of Foix, in right of his marriage with Eleanor of Aragon. John d'Albret, who obtained it in consequence of his marriage with Catherine of Foix, was in 1512 despoiled by Ferdinand the Catholic of Spanish Navarre, which, situated on the Southern side of the Pyrenees, was by far the more extensive and valuable part of his dominions. He was succeeded by Henry II., who left only a daughter, Jane, the issue of his marriage with Cathe-

rine of Valois, sister of Francis I. Antoine de Bourbon, Duke of Vendome, married this Princess, who brought him a son, who subsequently, in 1589, on the assassination of Henry III. of France, succeeded him on the throne under the title of Henry IV. Navarre became thus united to the dominions of France, the Kings of which thenceforward bore the title of Kings of France and Navarre. Lower Navarre, or the French division of the Kingdom, previously to the Revolution, formed with Bearn a Province, and at present is part of the Department BASSES PYRENEES.

Marcheña, *Description Géographique et Historique du Royaume de Navarre*; *Diccionario Geogr. Hist. de la Real Academia de Historia*, Madrid, 1802, 2 tom. 4to.; Miñano, *Diccionario Estadístico de España*, 11 tom. 4to. Madrid, 1826—1829; La Borde, *Itinéraire Descriptive de l'Espagne*, 6 tom. 8vo.

NAUCLEA, in *Botany*, a genus of the class *Pentandria*, order *Monogynia*, natural order *Rubiaceæ*. Generic character: calyx five-toothed; corolla funnel-shaped; capsule slightly three-angled, two-celled, many-seeded; flowers collected in a globular head above the common globular receptacle.

Six species, natives of the East Indies.

NAUCORIS, in *Zoology*, a genus of *Hemipterous* insects.

Generic character. *Antennæ* very short, concealed in a cavity beneath the eyes, quadriarticulate, cylindric, with the apex a little gracile; *labrum* large, exserted, trigonal, flat; *rostrum* triarticulate, shorter than the head, the basal joint very short; body ovate, considerably depressed, above flat, with the lateral margins acute; head transverse, rounded anteriorly, rather deeply inserted into the *thorax*, this last transverse, subquadrate, a little narrowed anteriorly, and deeply emarginate; *abdomen* large, broad, acute behind; the lateral margin greatly depressed, somewhat membranaceous; legs, anterior short, four posterior compressed; *femora* with a double row of denticulations; *tibiæ* and *tarsi* spinulous, and furnished with hairs on the margin for swimming.

Type of the genus, *Nepa cimicoides*, Linnaeus; *N. cimicoides*, Schellenberg, *Cimices*, pl. xii. Several species, frequenting fresh water, two of them natives of England.

NAVE, *n.* } A. S. *nafa*, *nafel*; Ger. *nabe*, *nabel*;
NA'VEL. } D. *nave*, *nævel*; Sw. *naf*, *nafle*.
Wachter and Ihre agree, that the word *næf*, *nafa*, in almost all Languages, Eastern and Western, means either *hollow*, or is applied to things that are *hollow*; and that the *navel* is also so called from its roundness and concavity.

Nave of the wheel, the *hollow* into which the ends of the axle are inserted.

Nave of a church, *nef du temple*; the *concave* centre or body of the church, distinguished from the side aisles or wings. Addison writes *nef*. Applied (generally) to the *centre*.

Navel; the *hollow* membrane connecting the parent and child.

Your noble confessour, ther God him save,
Shal hold his nose upright under the *nave*.
Chaucer. *The Clerkes Tale*, v. 7938.

The statue of Venus glorious for to see
Was naked fleting in the large see.
And fro the *navel* down all covered was
With waves grene, and bright as any glas.
Id. *The Knights Tale*, v. 1959.

And the axeltrees, the *nauelles*, spokes and shaftes were all molten.
Bible, Anno 1551. 3 *Kynges*, ch. vii.

Naue may signifie the desyres and delectacyons of man, whiche are healed by the worde & feare of God.

Id. *Ezekiel*, ch. xvi. notes.

Which neu'r shooke hands, nor bad farewell to him,
Till he vnseam'd him from the *naue* to the chops,
And fix'd his head vpon our battlements.
Shakspeare. *Macbeth*, fol. 131.

Being prest t' th' warre,
Euen when the *nauell* of the State was touch'd,
They would not thred the gates: this kinde of seruice
Did not deserue corne gratis.

Id. *Coriolanus*, fol. 15.

In describing this riuer, this one thing (right honorable) is come vnto my mind touching the center and *nauell* as it were of England.
Holinshed. *The Description of Britaine*, vol. i. ch. xi. p. 84.

The long *nef* [of the church of St. Justina in Padua] consists of a row of five cupolas: the cross one has on each side, a single cupola deeper and broader than the others.

Addison. *Travels in Italy*.

At evening service about six o'clock, the cathedral was illuminated in the finest manuer imaginable. Double rows of lustres lighted up the *nave*.
Eustace. *Italy*, vol. i. ch. v. p. 224.

Evelyn objects to the absurdity of representing Adam and Eve with *navels*, and a fountain with carved imagery in Paradise. The latter remark is just; the former is only worthy of a critical man-midwife.

Walpole. *Anecdotes of Painting*, vol. i. ch. iii. p. 84. note †.

NAU'FRAGE, } Fr. *naufnage*; Lat. *naufragium*;
NAU'FRAGEOUS, } from *navis*, a ship; and *frangere*,
to break.

Breaking of a ship; shipwreck; met. destruction.

And this I will say, that the opinion, not to relieve any case after judgment, would be a guilty opinion; guilty of the ruin and *naufnage*, and perishing of infinite subjects.
Bacon. *Works*, vol. ii. p. 618. *Speech on taking his place in Chancery*.

That tempestuous, and oft *naufrageous* sea, wherein youth and handsomeness are commonly tossed with no less hazard to the body than the soul.

Bishop Taylor. *Artificial Handsomeness*, p. 33.

NAUGHT, *n.* or } A. S. *nawhiht*, *nohwit*, *nauht*,
NOUGHT, } *nouht*, *naht*, *noht*, i. e. *no whit*.

In stede of messengeres, saue condȳte vs gyue.
Id. p. 260.

Bold of his speche, and wise and wel ytaught,
And of manhood him lacked righte *naught*.
Chaucer. *The Knights Tale*, v. 758.

And of a mirthe I am right now bethought,
To don you ese, and it shall coste you *nought*.
Id. *ib.* v. 770.

NAVE.

NAUGHT.

NAUGHT. And yet as playne as Christ speketh of hell in the gospels, Origene for al that, which neither was a *naughty* man, nor vnlearned in scripture, coule not clerely se it, but that he said the contrary.
NAUSEA. *Sir Thomas More. Workes, fol. 155. A Dialogue concerning Heresies, &c.*

The authour toucheth one specyal prerogative that we haue by a prieste bee he neuer so bad, in y^e his *noughtines* can not take from vs the profite of his masse. *Id. lb. fol. 226.*

And whom he hits *nought* knows, and whom he hurts *nought* cares. *Spenser. Faerie Queene, book ii. ch. iv.*

Imogen,
 Thy mother's dead.

IMO. I am sorry for 't my lord.

CYM. Oh she was *naught*; and long of her it was
 That we met heere so strangely.

Shakspeare. Cymbeline, fol. 397.

But the next morning, Pyrrus to win the advantage of fight in the plain field, where he might prevail with the force of elephants, sent first certain of his bands to seize upon the *naughty* ground they had fought on the day before.

Sir Thomas North. Plutarch, fol. 341. Pyrrus.

Well, thus did I for want of better wit,
 Because my parents *naughtly* brought me vp.

Mirror for Magistrates, fol. 297.

But after ward like swine they wallowed afresh in their puddles of pollutions, and as dogs licked vp their filthie vomit of corruption and *naughtinesse*.

Holinshed. Richard II. Anno 1382. vol. ii. p. 755.

CHLO. Play by yourself, I dare not venture thither:

You and your *naughty* pipe go hang together.

Dryden. Theocritus. Idyll. 27. Daphnis.

To death ourselves and all our work we owe:

But is there *nought*, O Muse, can save

Our memories from darkness and the grave,

And some short after-life bestow?

Hughes. Ode to the Memory of Mrs. Hughes.

NAVICELLA, in *Zoology*, a genus of *Gasteropodous Mollusca*.

Generic character. Shell operculated, elliptic or oblong, convex above with the spire oblique, and concave below; pillar lip flattened, margined, narrow and without teeth; *operculum* solid, flat, with a subulate and lateral tooth.

Type of the genus, *Nerita elliptica*, Lamarck; Chemnitz, vol. ix. pl. cxxiv. fig. 1082. The species are found in tropical seas.

NAUSEA, } Fr. *nausée*; It. *nausea*; Sp. *nausea*;
NAUSEATE, } *nausea*; Lat. *nausea*; Gr. *vavōia*,
NAUSEOUS, } from *vavōs*, *navis*, a ship.
NAUSEOUSLY, } Sensation caused by (the motion
NAUSEOUSNESS. } of) a ship; sea-sickness; loathing,
 disgust, squeamishness.

While we single out several dishes and reject others, the selection seems but arbitrary, or upon opinion; for many are commended and cryed up in one age, which are decried and *nauseated* in another.

Sir Thomas Brown. Vulgar Errors, book iii. ch. xxv. p. 211.

The light to him is the shadow of death; he has no heart, nor appetite to business; nay, his very food is *nauseous* to him, and his daily repast no refreshment.

South. Sermons, vol. iv. p. 109.

Hunger and thirst with patience will we meet,
 And what offended nature *nauseates*, eat.

Rowe. Lucan, book iii.

— The sun, that in the marshes breeds
 Nothing but *nauseous* and unwholesome weeds,
 With the same rays, on rich and pregnant earth,
 To pleasant flowers and useful fruits gives birth.

Walsh. Elegy. The Power of Verse.

Some venal pens so prostitute the bays,
 Their panegyrics lash; their satires praise.

So *nauseously*, and so unlike, they paint,

N——'s an Adonis; M——r a saint.

Garth. Claremont.

Riches and honours, then, are useless things,
 To the ill-judging palate sweet,
 But turn at last to *nauseousness* and gall.

Pomfret. A Prospect of Death.

Temperance itself will take a little [praise], but the stomach sickens with a surfeit of it, and the palate *nauseates* the debauch.

Observer, No. 3.

NAUTILUS, in *Zoology*, a genus of *Mollusca*.

Generic character. Shell discoid, spiral, multilocular, with simple sides, the latter equal; whorls contiguous, the last embracing and concealing the previously formed ones; *septa* transverse.

Type of the genus, *N. pompilius*, Linnæus; Buonan. pl. i. fig. 2. An extensive genus, consisting of recent and extinct species; the former marine, and several of both found on the coasts and crags of Britain.

NAVY, } Fr. *navie*, *naviger*; It. *navigare*;
NAVAL, } Sp. *navigar*; Lat. *navigare*, i. e.
NAVIGATE, } *navem* agere; Lat. *navis*, from Gr.
NAVIGATION, } *vavōs*, and that from *vé-eiv*, to swim,
NAVIGATOR, } to float. *Navy* is applied to
NAVIGABLE, } The whole fleet or float of ships;
NAUTICAL. } usually of armed ships or vessels.

To *navigate*; to guide the course of a ship; to pass over or along in ships; to sail.

& eft arjued on his lond with fulle grete *naue*.

By the transformation of the ships into sea-deities, Virgil would insinuate, I suppose, the great advantages of cultivating a naval power, such as extended commerce, and the dominion of the ocean.

Jortin. *Dissertation* 6. p. 192.

NAVIGATION LAWS. At the present day it is needless to consider these laws further than by showing: 1. the system which was adopted in the time of the Commonwealth; and 2. the alterations which that system has undergone; for the various regulations to which Navigation was subject in more ancient times, have ceased to be of any interest or importance. The Act of Navigation was passed by the Republican Parliament, on the 9th day of October, A. D. 1651. It cannot be denied that the Parliament was partly actuated by the desire of promoting our own shipping interests; but the more immediate objects which it had in view, were to mortify our Sugar Islands, which continued to favour the party of the King, and also to injure the Dutch, our great rivals at that time on the sea, by depriving them of the carrying trade, which was almost exclusively in their hands, and which was the principal source of their maritime greatness. Previously to the present century, the Act in question received almost universal praise; it was styled the *Charta Maritima* of England; and Adam Smith characterised it as "perhaps the wisest of all our commercial regulations." But when it is considered that the Dutch continued to retain their maritime power long after the passing of the Act; that they subsequently attributed their own decay, not to the operation of the Act, but to the influence of excessive taxation; and that the passing of the Act was not followed by any rapid improvement in our commercial marine, but on the contrary, by an actual falling off in the Greenland and Baltic trades; the praise which it has received is, perhaps, somewhat extravagant. See Roger Coke's *Treatise on Trade*, p. 89, published in 1671, pp. 36, 48; Child's *Treatise on Trade*, published in 1691, p. 89; and Sir Matthew Decker's *Essay on the Causes of the Decline of Foreign Trade*, published in 1756, p. 60. The doctrine of modern times is, that every measure which prevents the increase of commerce must *pro tanto* prevent the increase of shipping also, because commerce is the cause and not the effect of shipping. Upon this principle it became apparent that certain modifications of the system were advisable, and circumstances which we shall presently explain actually rendered those modifications necessary.

The principal provisions of the Act were, first, that no goods or commodities whatever, of the growth, production, or manufacture of *Asia*, *Africa*, or *America*, should be imported either into England or Ireland, or any of the Plantations, except in ships belonging to English subjects, and of which the master and the greater number of the crew were also English; and secondly, that no goods of the growth, production, or manufacture of any Country in *Europe*, should be imported into Great Britain, except in British ships, or in such ships as were the real property of the people of the Country or place in which the goods were produced, or from which they could only be, or most usually were exported. The first of these provisions secured to British ships the whole of the importation trade from the other three quarters of the globe; and the second prevented any one nation from engrossing the whole of the carrying trade between Great Britain and the Continent of Europe; but it was

aimed principally against the Dutch, who had little native produce to carry.

After the Restoration, these regulations were re-enacted by Stat. 12 Charles II. c. 18.; but the clause which prohibited the importation of goods, except in British ships, or in ships belonging to the Country of which the goods were the produce, instead of extending to all descriptions of goods, as it had originally done, was now confined to seventeen descriptions only, which were enumerated in the Statute, and which from such enumeration have since become well known in commerce by the name of *enumerated articles*.

The enumerated articles were masts, timber or boards, salt, pitch, tar, rosin, hemp or flax, raisins, figs, prunes, olive-oil, corn or grain, sugar, potashes, wines, vinegar, and spirits, called *aqua vitæ* or brandy. But as the rivalry with the Dutch continued, and as there was reason to suppose, that, aided by the contiguity of their own Country to the Netherlands and Germany, they were able to evade the law, it was enacted by Stat. 14 Charles II. c. 11. sec. 23. that no sort of wines except Rhenish, spicery, grocery, tobacco, potashes, pitch, tar, salt, rosin, deal boards, fir, timber, or olive-oil, should be imported from either of those Countries, either in British ships, or in any other vessel whatsoever. The greater part of this barbarous enactment, which tended to destroy almost all commercial intercourse between Great Britain on the one hand, and Holland, the Netherlands, and Germany on the other, was permitted to remain in force till the present century.

In the year 1822, while Mr. Wallace was President of the Board of Trade, several important changes were introduced. 1. Our commerce was placed on the same footing with that of the whole of Europe, and the invidious prohibitions to which, as before mentioned, the trade with the Netherlands and Germany had been subject, were withdrawn. 2. The importation of the *enumerated articles* was permitted, not only in British ships and in ships belonging to the Country of which the articles are the produce, but also in ships of the Country from which the articles are imported into this Country. 3. Whereas by the old law, goods the produce of Asia, Africa, and America could only be imported directly from the places of which they were the produce, this restriction was removed, and the importation of such goods was permitted to be made from any part of the World, subject, however, to this proviso, that if they should be imported from any port of *Europe*, they should not be consumed in this Country, but should be reexported.

That which is called the *Reciprocity System*, is also an important innovation. For the purpose of protecting our own shipping, higher duties had been imposed on goods imported in foreign ships than on goods imported in British ships; and the tolls payable to light-houses, and port and harbour-duties, were higher on foreign ships than on British. The first step towards the Reciprocity System was forced upon us by the retaliatory measures adopted by the United States. When that Nation had established its independence, it proceeded to make Navigation Laws similar to our own. It placed a higher duty on foreign tonnage than on its own, and a higher scale of duties on goods imported in foreign ships than on such as were imported in ships belonging to its own subjects. Although this measure was intended to injure our shipping, we had no just grounds for complaint; because we could not expect others to set no discriminating duties on our ships, while we continued

NAVIGATION
LAWS.

NAVIGATION
LAWS.

NAVIGATION
LAWS.
NAY.

to retain our discriminating duties on theirs. We did not, in the first instance, propose that the discriminating duties should be taken off on both sides, as prudence would have dictated, but, on the contrary, we resorted to retaliatory regulations, in the hope of rendering nugatory the system which had been adopted against us. In this hope we were disappointed; and at length it became obvious that the tendency of all our endeavours was merely to cause the productions of other Countries to be admitted into the United States on more favourable terms than our own. We then became sensible of our error; and, at length, by the Commercial Treaty of 1815, it was agreed that the discriminating duties both on ships and goods should be given up by both parties, and that the ships of each should be admitted into the harbours of the other on the same terms as its own.

The Reciprocity System was next extended to the new States in South America. In this instance, we did not wait to be driven on by retaliatory measures, but we at once offered to admit their ships into our harbours subject to the same charges and duties as our own, on condition that they admitted ours on the same terms, which proposal was gladly accepted on their part, although they had begun to consider the necessity of following our example, and making Navigation Laws for their own protection.

In the year 1822, Prussia procured herself to be admitted to the benefits of the Reciprocity System, by imposing discriminating duties on our ships, and threatening to impose them also on goods imported in our ships; and Sweden and Denmark were soon afterwards placed upon the same footing with Prussia.

Having thus explained some of the more important changes which have been made in our Navigation Laws, we proceed to give a syllabus of the laws as at present established, which we take from the Statute 6 Geo. IV. c. 109. an Act of Parliament remarkable for its perspicuity and conciseness.

1. The several sorts of goods hereinafter enumerated being the produce of Europe, (that is to say,) masts, timber, boards, salt, pitch, tar, tallow, rosin, hemp, flax, currants, raisins, figs, prunes, olive oil, corn or grain, potashes, wine, sugar, vinegar, brandy, and tobacco, may not be imported into the United Kingdom to be used therein, except in British ships, or in ships of the Country of which the goods are the produce, or in ships of the Country from which the goods are imported.

2. Goods the produce of Asia, Africa, or America, may not be imported from Europe into the United Kingdom, to be used therein, except the goods hereinafter mentioned; (that is to say.)

Goods, the produce of places in Asia or Africa, within the Straits of Gibraltar, or of the dominions of the Emperor of Morocco, imported from places in Europe within the Straits of Gibraltar.

Goods the produce of places within the limits of the East India Company's Charter, which (having been imported into Gibraltar or Malta in British ships) may be imported from Gibraltar or Malta.

Goods taken by way of reprisal by British ships: bullion, diamonds, pearls, rubies, emeralds, and other jewels and precious stones.

3. Goods the produce of Asia, Africa, or America, shall not be imported into the United Kingdom, to be used therein, in foreign ships, unless they be the ships of the Country of Asia, Africa, or America, of which the goods are the produce, and from which they

are imported, except the goods hereinafter mentioned, (that is to say.)

Goods the produce of the dominions of the Grand Signor, in Asia or Africa, which may be imported from his dominions in Europe, in ships of his dominions: Raw silk and mohair yarn, the produce of Asia, which may be imported from the dominions of the Grand Signor in ships of his dominions; bullion.

4. All manufactured goods are deemed to be the produce of the Country of which they are the manufacture.

5. No goods may be imported into the United Kingdom from the Islands of Guernsey, Jersey, Alderney, Sark, or Man, except in British ships.

6. No goods may be exported from the United Kingdom to any British possession in Asia, Africa, or America, nor to the Islands of Guernsey, Jersey, Alderney, Sark, or Man, except in British ships.

7. No goods may be imported coastwise, from one part of the United Kingdom to another, except in British ships.

8. No goods may be carried from any of the Islands of Guernsey, Jersey, Alderney, Sark, or Man, to any other of such Islands; nor from one part of any such Islands to another part of the same Island, except in British ships.

9. No goods may be carried from any British possession in Asia, Africa, or America, to any other of such possessions, nor from one part of any of such possessions to another part of the same, except in British ships.

10. No goods may be imported into any British possession in Asia, Africa, or America, in any foreign ships, unless they be ships of the Country of which the goods are the produce, and from which the goods are imported.

From this it appears that the coasting trade, the trade between the Colonies and the United Kingdom, and, generally, the trade between different parts of the British dominions, must be carried on exclusively in British ships; and that foreign ships are only admitted to compete with British, where they could not be excluded with any degree of fairness. See Mr. Huskisson's *Speech on the Shipping Interests*, 1826; and Mr. McCulloch's *Note on the Navigation Laws*, in the IVth Volume of his Edition of Smith's *Wealth of Nations*.

NAWL, or } A *nawl*, i. e. an *awl*; my *nawl*, i. e. mine *awl*. See *AWL*. Cotton, perhaps, means "mine *alls*," all my goods and chattels.

Darest thou drawe out Leuythā with an angle, or bynde his tonge with a snare? Canst thou put a ryng in the nose of him, or bore his chaftes thorow wyth a *naule*.

Bible, Anno 1551. *Job*, ch. xl.

Give up your key unto that Lord that *neares* you.
Haywood. Royal King.

Thus Satan talking to his *nearest* mate
With head up-lift above the wave, and eyes
That sparkling blaz'd, his other parts besides
Prone on the flood, extended long and large
Lay floating many a rood.
Milton. Paradise Lost, book i. l. 192.

With joy
And tidings fraught, to hell he now return'd,
And at the brink of Chaos, *neer* the foot
Of this new wondrous pontifice, unhop't
Met who to meet him came, his offspring dear.
Id. Ib. book x. l. 347.

Son, thou in whom my glory I behold
In full resplendence, heir of all my might,
Nearly it now concerns us to be sure
Of our omnipotence, and with what arms
We mean to hold what anciently we claim
Of deitie or empire.
Id. Ib. book v. l. 721.

One would have thought, that the *nearness* of a father would have
saved him; but it was this alone that condemned him.
South. Sermons, vol. viii. p. 123.

Near yonder copse, where once the garden smil'd,
And still where many a garden flow'r grows wild,
There, where a few torn shrubs the place disclose,
The village preacher's modest mansion rose.
Goldsmith. The Deserted Village.

When now more *nearly* to the walls he drew,
He left the plain and beaten path, that straight
Led o'er the meadow to the lofty gate.
Hoole. Orlando Furioso, book vi. l. 417.

The comeliness of whose person [the last Earl of Devonshire]
was very *near* raising him to that throne, for *nearness* to which in
blood, he was a prisoner from ten years old.
Walpole. Anecdotes of Painting, vol. i. ch. vii. p. 218.

NEAT, *n.* } A. S. *neat, niten*; Sw. *noet*. Ihre
NE'ATHERD, } thinks so called from *niotan, nyttan*,
NE'ATRESS. } *uti*, to be useful; because of its great
use to mankind. In Scotch, "*Nolt, nowt*; black cattle,
as distinguished from horses and sheep. It properly
denotes *oxen*." Jamieson. It seems properly to denote
horned cattle, from the A. S. *hnit-an, cornu petere*, to
butt or strike with the horn.

His lordes shepe, his *nete* and his deirie,
His swine, his hors, his store and his pultrie,
Were holly in this reves governing.
Chaucer. The Knightes Tale, v. 599.

So hee departed very angrily, and went to the kinges *netcherdes*
house, and there desired lodgings.
Barnes. Workes, fol. 190. A Supplication to King Henry VIII.

At that time the chiefest peers and lords of Rome did ravish the
Sabines' daughters, which came to Rome to see common sports
played, there chanced a few rascals (as hog-herds or *neat-herds*) to
carry away a goodly fair woman.
Sir Thomas North. Plutarch, fol. 527. Pompeius.

The *neatresse*, longing for the rest,
Did egge him on to tell
How faire she was, and who she was,
"She bore," quoth he, "the bell
For beautie."
Warner. Albion's England, book iv. ch. xx.

If right my conjecture, Endymion, I ween,
Like me too once tended his steers on the green;
Yet the moon in this *neatherd* took such a delight,
That she met him at Latmos, and kiss'd him all night.

joint with two elongate-conic processes, terminated with a
seta; legs twelve, anterior pair longest, simple, with the
last joint composed of many other joints; five hinder
pair equal, and approximate, with the last joint bifid.

Type of the genus *Cancer bipes*, Herbst. *Kraben*,
vol. ii. pl. xxxiv. fig. 7. Found in the European Ocean,
and on the coasts of Britain not very uncommonly.

NEBRIA, in Zoology, a genus of *Coleopterous* in-
sects.

Generic character. Palpi six, moderately long;
labial with the two basal joints short, third and fourth

NEBRIA. equal, the latter obliquely truncate; internal maxillary palpi with the basal joint shortest; external with the basal joint short, second longest, third and fourth nearly equal, the latter truncate; *labrum* subquadrate, slightly emarginate; mandibles porrect, toothed near the base; *labium* rounded; *mentum* linear, trilobate, the centre lobe bifid; *antennæ* linear; *abdomen* elongate; body depressed; *thorax* transverse, cordate-truncate, the basal angle straight; wings two; anterior *tarsi* of the males with their basal joints dilated; *tarsi* all penta-merous.

Type of the genus, *Ca. complanatus*, Linnæus. Donovan, *Britt. Ins.* vol. xiv. pl. 488. Several species, in general of pale colours, with dark marks, and usually found on the coasts. Three are found in Britain.

NEBULE, Fr. *neble*; Lat. *nebula*. A little cloud.

O light without *nebule*, shining in thy sphere.
A Ballade in Commendation of our Lady. Imputed to Chaucer.

NECESSARY, adj.	} Fr. <i>nécessaire</i> , <i>nécessiter</i> ; It. and Sp. <i>necessario</i> ; Lat. <i>necessarius</i> , <i>nécesse</i> . Scaliger (<i>de Causis</i> , cap. 166.) says that <i>nécesse</i> is <i>nec esse</i> . Vossius and others, with more probability, derive from <i>ne</i> and <i>cesso</i> ; <i>ut propriè nécesse sit, quod differri non potest</i> ; (<i>ἀναστροφή</i> , <i>incessabile</i> , Martinius,) that which
NECESSARY, n.	
NECESSARILY,	
NECESSARINESS,	
NECESSITATE,	
NECESSITATION,	
NECESSITIED,	
NECESSITOUS,	
NECESSITOUSNESS,	
NECESSITUDE,	
NECESSITY.	

cannot cease, stop, or be stopped. Necessary is thus a negative term: it is used as equivalent to

Needful or compulsive; unavoidable or inevitable, or that cannot be shunned or escaped; irresistible, resistless, or that cannot be stood up against, supported, or opposed; indispensable, or that cannot be set apart or aside, cannot be done without; also to needful or requisite. And thus, *necessaries* are things requisite or required for particular objects or purposes; that are wanted or must be had or used for the fulfilment of those purposes. And

Necessitous, wanting or not having such *necessaries* or things needful or requisite; needy, poor.

Therefore I gesside *necessarie* to preie britherin that thei come bfore to ghou.
Wiclif. 2 *Corynth.* ch. ix.

I meane as though I laboured me in this,
To inquire which thing cause of which thing be,
As whether that the prescience of God is
The certaine cause of the *necessite*
Of thinges that to comen be paided,
Or if *necessitie* of thing comming,
Be cause certaine of the purveying.

But now ne enforce I me not in showing,
How the order of the causes stant, but well wot I
That it behoueth, that the befalling
Of thinges wiste before certainly,
Be *necessarie*, all seeme it not thereby,
That prescience put falling *necessarie*
To thing to come, all fall it foule or faire.

Chaucer. *Troilus and Creseide*, book iv. p. 273.

So in the gossell, the curates which in euery parishu preach the gossell ought of dutie to receiue an honest liuing for them, and their households, & eue so ought the other officers, which are *necessarily* required in the commonwealth of Christ.

Tyndall. *Workes*, fol. 83. *The Parable of the Wicked Mammon.*

It *necessarily* foloweth that by one or other of these wayes, the churche of Christ hath alway and neuer fayleth y^t right vnderstanding of scripture, as far as longeth for our *necessite*.

Sir Thomas More. *Workes*, fol. 148. *A Dialogue concerning Heresies*, &c.

I must vnto the road, to dis-embarque
Some *necessaries*, that I needs must vse,
And then Ile presently attend you.

Shakspeare. *Two Gentlemen of Verona*, fol. 26.

There is no common-wealth at this daie in Europe, wherin there is not great store of poore people, and those *necessaries* to be relieued by the welthier sort, which otherwise would starue and come to vtter confusion.

Holinshed. *The Description of England*, vol. i. ch. x. p. 307.

This ring was mine, and when I gaue it Hellen,
I bad her if her fortunes euer stooode
Necessitied to helpe, that by this token
I would releuee her.

Shakspeare. *All's Well that Ends Well*, fol. 252.

MASS. [To Scipio.] ——— All
From a *necessitied* and innate temperance
Would be as you are.

Nabbes. *Hannibal and Scipio*, fol. 2.

The mutual *necessitudes* of human nature necessarily maintain mutual offices between them. Hale. *Origination of Mankind*.

But who can turn the streame of destinee,
Or break the chayne of strong *necessitie*,
Which fast is tyde to love's eternall seat?

Spenser. *Faerie Queene*, book i. can. 5.

The Anaximandrian atheist plainly discovers, that when the Democriticks and Atomicks have spent all their fury against these qualities and forms, and done what they can to salve the phenomena of nature, without them another way, themselves do notwithstanding like drunken men reel and stagger back again into them, and are unavoidably *necessitated* at last, to take up their sanctuary in them. Cudworth. *Intellectual System*, fol. 143.

This renders his Poems more animated but less grave and majestic; and consequently *necessitates* the frequent use of a lower style.

Pope. *Odyssey*. Postscript.

For strong *necessity* our toil demands,
Claims all our hearts, and urges all our hands.

Id. *Homer. Iliad*, book ii.

The only way that any thing that is to come to pass hereafter, is or can be *necessary*, is by a connection with something that is *necessary* in its own nature, or something that already is or has been: so that the one being supposed, the other certainly follows.

Edwards. *On the Freedom of the Will*, part i. sec. 3.

But here follows the mischief: when once fashion hath annexed the use of these articles of dress to any certain class, the middling ranks, for example, of the community, each individual of that rank finds them to be *necessaries* of life; that is, finds himself obliged to comply with the example of his equals, and to maintain that appearance which the custom of society requires.

Paley. *Moral Philosophy*, vol. ii. ch. xi. p. 365.

The only question in dispute between the advocates for philosophical liberty and the *necessarians*, is this; whether volition can take place independently of motive?

Belsham. *Philosophy of the Mind*, ch. ix. sec. 1. p. 230.

And the contrary to liberty, whatever name we call that by, is a person's being hindered or unable to conduct as he will, or being *necessitated* to do otherwise.

Edwards. *On the Freedom of the Will*, part i. sec. 5.

Philosophical *necessity* is really nothing else than the full and fixed connection between the things signified by the subject and predicate of a proposition, which affirms something to be true.

Id. *Ib.* part i. sec. 3.

NECK,

NECKERCHIEF,

NECKLACE,

NECK-LAND,

NECK-VERSE.

A. S. *hnecca*, *necca*; D. *neck*; Ger. *nacke*; Sw. *nacke*; which latter Serenius derives from ancient *hnig-a*, to bend, modern *nicka*, to nod. Wachter tells us that some derive the Ger. from *neig-en*, *inclinare*, to bend. And in Kilian we find D. *neck*, *nick*, *cervix*; *nick*, *nutus*; *nicken*, *nuere*, *nutare*, to nod, to bend the neck.

Tooke thinks the A. S. *hnecc* may perhaps also be the past tense *hnig-an*, to bow, to bend, to incline. See KNEE, KNUCKLE, NOD.

If they would know who robb'd him of his life,
Let them call home dame Elenor his wife,
And let her bring her *necromantic* book,
That foul hag Jordan, Hun, and Bullenbrook.

Drayton. The Duke of Suffolk to Queen Margaret.

Lamps must be solemnly burned before it: and then, after some diabolical exorcisms *necromantically* performed, the head shall prove vocal.

Gregory. Posthum. 1650, p. 199.

How curious to contemplate two state-rooks,
Studious their nests to feather in a trice,
With all the *necromantics* of their art,
Playing the game of faces on each other.

Young. The Complaint. Night 8.

NECRO-
MANCY.

Epic, the whole adventure is manifestly a *descent*, and not in any part, as in Homer, an *evocation*. Jortin has furnished not an apology, but a probable reason, by which it is by no means unlikely that the Poet was induced to mar this fine episode of his immortal Work at the moment of its completion. "Incantations, evocations of the Dead, conversations with the Shades, communications with the Infernal Powers, Necromantic divinations, all these belonged to the Art Magic; and Magic was held in abomination by the Romans in Virgil's time and before it: and hence Christian Emperors found it no difficulty to make very severe laws against such practices which were already in bad repute. The Poet, therefore, might choose to close the narrative with a hint that it was entirely a fiction." (*Diss. vi. Works*, xi. 232.) If Warburton's most ingenious theory of adumbrated Initiation be admitted, the VIth Book of the *Æneid* is removed many degrees further from approach to Necromancy; and we, therefore, need not stop to determine whether that most acute inquirer be right or wrong in his rejection of the general interpretation of the *porta eburnea*, by which he does not think Virgil at all meant to imply that the narrative was to be considered fictitious.

Periander
of Corinth
and Me-
lissa.

The earliest *Historical* tale of Necromancy which we recollect is related by Herodotus of Periander of Corinth. That Tyrant having killed his wife Melissa by kicking her when in an advanced state of pregnancy, would not leave her in peace even when in the tomb; but prompted by an avaricious wish to discover the spot in which she had deposited a sum of money intrusted to her by a friend, he despatched an envoy to a Necromantic Oracle on the banks of Acheron in Thesprotia, to demand information from her Spirit. Melissa appeared, but she refused to give a satisfactory answer till relieved from a great annoyance under which her Ghost was suffering. She was naked it seems, and perishing with cold; for the clothes interred with her ashes were useless, because they had not been burned. In token of her verity, and in order to prove that she was the genuine Melissa and no juggling fiend, she disclosed enigmatically a revolting secret known only to herself and to her husband, in words to which he could not fail to annex a correct interpretation. Convinced by this proof, Periander issued a proclamation that every woman in Corinth should attend in the Temple of Juno, clad in her richest attire as for a Festival. There, without distinction of rank or age, he stripped all his female subjects to the skin, and piling their clothes in one heap, he burned them, after supplication to Merissa. The Ghost, now well clothed and comfortable, reappeared cheerfully and complying, and indicated the spot in which the treasure was to be found. (v. 92.)

Evocation
of Darius in
the *Persæ*
of *Æschy-
lus*.

The appearance of the Shade of Darius in the *Persæ* of *Æschylus* is very nobly given. After receiving news of the great defeat of her son Xerxes at Salamis, Atossa has prepared the requisite offerings to the Dead, milk from a white cow, honey, water from a pure fountain, unadulterated wine, olives, and flowers, and she instructs the ancient Counsellors of the deceased King to evoke his shade. They, who form the Tragic Chorus, begin an incantation, of part of which the following lines are a pretty close version.

Royal Lady, Persia's pride,
Thine offerings in Earth's chamber hide;
We, meanwhile, with hymns will sue
The Powers who guard Hell's shadowy crew,

Till they to our wish incline.—
Gods below, ye Choir divine,
Earth, Hermes, and thou King of Night,
Send *His* Spirit forth to light!
If he knows worse ills impending
He alone can teach their ending.

Hears the blessed while we sing?
Lists to us the godlike King,
While from these lips barbaric flow
Lays of many-varied woe,
Piteous tones which anguish show?
We will ring each change of tears.—
Surely, from the depths he hears!

Earth! and all ye Gods who tread
Her bosom, wardens of the Dead!
Brief issue from your dreary ford
To th' illustrious Chief accord,
Susa's son, and Persia's Lord;
To Him who knows not yet a peer
Buried within Persian bier!

Loved was he! how loved the heap
Where his gentle relics sleep!
Pluto, in thy marshalling
Of the Spirits, hither bring
Darius, every inch a King!

* * * * *

Monarch of an ancient line,
Hither incline!
Plant upon the lofty mound
Adorning thy sepulchral ground
Thy saffron-tinctured sandal's hem;
And the royal diadem
On thy lordly forehead rear!
Darius, best of Fathers, haste, appear!

* * * * *

The incantation is successful, notwithstanding that Darius, when he rises, assures his ancient friends that exit from below is by no means easy, and that the subterranean Gods are far more willing to take than to let go. He, however, having considerable influence among them, had found means to come, and in order that he might not be blamed, he had hastened as quickly as possible; the only boon which he demands in return is, that they would abstain from long-winded communications.

Lucian in one of his most amusing Dialogues, the *Menippus*, or *Necyomanteia*, introduces his hero Menippus as one fatigued and distracted by the gross contradictions which assail him on all sides as to the conduct of Life. He has searched the Poets, and they taught him that Gods no less than Demigods employ themselves in war and factions, in rapes and adulteries, in plunder, violence, and cruelty, in breaches of filial duty, and in incestuous connections. He then applied to the Schools, in which he found many *soi-disant* Philosophers, ignorant, wavering, and uncertain; and he soon perceived (to turn his proverbial idiom into one of our own closely resembling it) that he had tumbled out of the frying-pan into the fire, *ἐλελήθειν δ' ἐμαυτὸν ἐς αὐτό φασι τὸ πῦρ ἐκ τοῦ καπνοῦ βιαζόμενος*. Some urged him to cultivate Pleasure as the only source of happiness; others to adopt a Cynical course; to toil, watch, and starve; to expose himself to squalid misery, reproach, and contumely. Here, money was spurned and treated as a matter indifferent; there, wealth of itself was declared to be a blessing. Whenever he asked about the World and Nature, he was overpowered by a gabble concerning Ideas, incorporeal substances, atoms, and a Vacuum; and that which not

NECRO-
MANCY.

The Menip-
pus, or Ne-
cyomanteia
of Lucian.

NECRO-
MANCY.

a little increased his perplexity, and seemed to him the most absurd of all absurdities, was that every separate Teacher maintained his own opinions, however strongly opposed to those of his brethren, by unanswerable, incontrovertible, and irrefragable arguments; so that the unhappy tyro never could find one syllable which he dared utter against a Sophist who might even insist that Heat and Cold were precisely the same thing, notwithstanding his senses assured him that they were in truth absolute contraries. Moreover he soon discovered that Theory and Practice were every where at variance. None were greater usurers nor demanded more exorbitant salaries for tuition than the contemners of wealth; none more ambitious than such as renounced Glory. His sole consolation arose from one very ingenious reflection founded upon these anomalies, that if he himself were ignorant, so also were the most Wise.

To clear up his doubts, which are very playfully detailed in this and a good deal more true and agreeable Satire, Menippus has recourse to a Magus, a disciple and successor of Zoroaster: having heard that he possessed spells and incantations by which the portals of Hades could be unlocked; that he could evoke and afterwards dismiss the Spirit of any dead person whom he pleased to summon; and that by his aid, therefore, the opinion of Teiresias might be obtained. With this object, Menippus undertook an expedition to Babylon, and lodged himself under the roof of this Chaldaean, a man of notable wisdom and profound skill; a diviner venerable for his hoary locks and flowing beard, and possessed of a name sufficiently avouching the truth of his Necromantic pretensions: it was Mithrobarzanes. After much solicitation and lavish promises of reward, Menippus obtained his object; and Lucian expounds the preparations which were deemed necessary for this communing with the Dead. There can be little doubt that, in his account of the mystic ceremonies employed, he lays aside the Satirist, and describes those which were in common use among pretended Necromancers. Mithrobarzanes, during nine and twenty days, commencing with the New Moon, led his votary every morning, with his face towards the East, to the banks of the Euphrates, and there made him perform his ablutions; murmuring over him at the same time a very long speech, of which the Neophyte heard but little, from its volubility and indistinctness; all he knew for certain was, that it contained the names of a good many Demons. When this charm was finished, the Magus spat thrice in his meek disciple's face, and led him home again, never permitting his eyes to rest upon any passenger whom they chanced to meet. Acorns meantime were their food; their drink was of somewhat better order, milk, honeyed water,* (*μελίκρατον*), and the water which moistened the lips of Kings, that of Choaspes; their couches were on the grass in the open air. After the completion of this discipline, Menippus was brought out by night to the Tigris, purified by its water, and wiped dry, lustrated by a torch, a sea onion, (*σκέλλη*), and other purgatives; fortified against all Demons by the old, unintelligible, magical chant, and by the frequent pacing round him of the Necromancer; and finally led home walking backward. The remainder of the night was occupied in preparation for their approaching voyage. Mithrobarzanes clothed himself in a magical garb of

Median fashion, and dressed his companion (like Bacchus in the *Frogs*) in a lion's hide, presenting him at the same time with a club and a lyre, and desiring him, if he were asked his name, to reply that he was Hercules, Ulysses, or Orpheus; a cunning trick, by which it was thought the vigilance of Æacus might be happily eluded. At dawn of day they descended to the Euphrates, and embarked in a boat, in which were stowed honeyed water and other requisites for a mystic sacrifice. The tide bore them through a forest into a lake within which the river was lost; and having crossed this expanse, they disembarked, Mithrobarzanes going first, on a recluse, gloomy, and darkly-wooded spot, where they dug a trench and filled it with the blood of slaughtered sheep. After this Homeric preliminary, the Necromancer lighted a torch, and no longer muttering, but screaming at the loudest pitch of voice which he could attain, summoned every Demon with whom he was acquainted; vociferating *Pœnæ*, (*Ποινᾶς*), Erinnyes, Hecate, Proserpine, and a vast number of other barbarous polysyllabic names with whose meaning Menippus was unacquainted; *παραμιγνὺς ἅμα βαρβαρικά τινα καὶ ἄσημα ὀνόματα, καὶ πολυσύλλαβα*. Then the Earth trembled and gaped, the barking of Cerberus was distinctly heard, and the Infernal Lakes, Pyriphlegethon, and the Palace of Pluto became visible.

We need not pursue the voyage through the *Inferi*, admirably as it is told, and much as its keen and spirited touches will repay the reader who turns to it for its own sake. Our object has been solely to adduce its illustrations of Necromantic ceremonies, and it may be sufficient therefore to conclude with the advice which Teiresias bestowed; advice which, although, perhaps, a little too much in accordance with the carelessness of the *pococurante* Philosophy of Samosata, still is not without its wisdom, so far as regards *this* generation only; the only generation with which Lucian was acquainted. *Ὁ τῶν ἰδιωτῶν ἀριστος βίος καὶ σωφρονέστερος ὥς τῆς ἀφροσύνης παυσάμενός του μετεωρολογεῖν, καὶ τέλη καὶ ἀρχὰς ἐπισκοπεῖν, καὶ καταπτύσας τῶν σοφῶν τούτων συλλογισμῶν καὶ τὰ τοιαῦτα λήρον ἡγήσάμενος, τοῦτο μόνον ἐξ ἅπαντος θηράσῃ, ὅπως τὸ παρὸν εὖ θέμενος, παραδράμῃς γελῶν τὰ πολλὰ, καὶ περὶ μηδὲν ἐσπονδακώς*. A life of privacy is the most happy and the most discreet. Laying aside, therefore, the folly of lofty contemplations, and ceasing to investigate causes and effects, I advise you to reject all those subtleties of the Wise; and holding such matters to be nothing worth, to pursue this single object,—how, wisely employing the goods at hand, you may lightly pass over most things with a smile, and think nothing can deserve one crabbed thought of care.

Satisfied with this screed of doctrine, Menippus naturally began to feel anxious for his return to upper day, since evening was now coming on; and he applied to Mithrobarzanes accordingly. The guide calmed his fears by leading him into a darker spot than any he had yet trodden, into which one doubtful glimmering of light penetrated through a chink far above. "That," said he, "is the Cave of Trophonius, and if you make your way up to it, you will find yourself at once in Boeotia." At the word, Menippus took a respectful but hasty leave, and scrambling out, with no small difficulty, through the narrow aperture, found himself, he scarcely knew how, once again in Lebadeia.

The only feeling excited by the Necromancy of the *Lucan's* Witch Erichtho, in the VIth Book of *Lucan's Pharsalia*, Erichtho.

* According to Eustathius the *μελίκρατον* of Homer is honeyed milk, that of all later authors honeyed water.

NECRO-
MANCY.

NECROMANCY. is disgust. The Poet has outstepped the legitimate boundaries of horror, without attaining that supernatural grotesque by which modern German writers sometimes partially redeem a similar error. Lucan, on the contrary, has blotted the whole of that portion of his canvass with a forced, nauseous, and extravagant caricature.

Tertullian's
opinion
concerning
Necromancy.

In the Tract of Tertullian, *De Animâ*, occurs a remarkable passage concerning Necromancy. He inquires whether a departed Soul, either at its own will or in obedience to the command of another, can return from the *Inferi*? The Heathen belief plainly taught that Hades was not entered till the rites of sepulture had been paid; a notion which Tertullian ridicules by asking what portion of those rites the Soul carries with it to its spiritual abode? Again, he considers the cases of infants dying immaturely, of the *innuptæ*, and of those who perish violently, especially of criminals who have endured capital punishment; all of whom, by the Pagan Creed, were excluded from the final abode for a certain period, namely, such as was wanting to complete their natural term of existence; and he then reduces the proposition to a dilemma. If the abode be an evil one, it ought to be open to the wicked; if on the contrary it be good, why prohibit the pure from admission, solely because they are unfortunate? He then passes on to Magic, which he treats altogether as a deception; but a deception concerning the principles of which many are in error. He maintains that whenever Sorcerers think they reanimate the corpses of those who have died immaturely, that apparent reanimation is, in truth, effected by the agency of Demons; those very Demons, indeed, who have occasioned the death in violation of the course of Nature. The same agency may frequently be detected in exorcisms; and in that which is most to our present purpose, the evocation of departed Spirits. *Sic et in illâ aliâ specie Magiæ quæ jam quiescentes animas evellere ab Inferis creditur et conspectui exhibere, non alia fallaciæ vis est operator planè, quia et phantasma præstat, quia et corpus adfingitur; nec magnum illi exteriores oculos circumscribere, cui interiorem mentis aciem*

excæcare perfacile est. The Egyptian Magicians, Simon Magus, and Elimas the Sorcerer, all, it is said, exhibited such corporeal deceptions; and the evocation of Samuel was similarly conducted. *Absit alioquin ut animam cujuslibet Sancti, nedum Prophetæ, a Dæmonio credamus extractam.* Tertullian then argues from the Parable of Dives and Lazarus, that the gates of the *Inferi* are not opened to any departed Soul; and concludes a statement not a little perplexed and obscure by the following more distinct summary. *Etsi quasdam (animas) revocavit in corpora Dei virtus, in documenta juris sui, non idcirco communicabitur fidei et audaciæ Magorum, et fallaciæ somniorum, et licentiæ Poetarum.* (cc. 56, 57.)

On the fruitful theme of modern Necromancy, we scarcely dare to trust ourselves, at least for the present; and, perhaps, the reader will be satisfied if we conclude with the discreet advice of the Jesuit Del Rio, than whom no writer with whom we are acquainted was more profoundly versed in this mysterious Science. *Periculi plena res, tum ipsi Mago quem Diabolus interdum aufert, et vitæ aspectuique subtrahit, ut de quodam narrat Franciscus Picus; tum ipsis qui curiosè consulunt, qui nonnunquam de mente abalienantur et malè pereunt, ut Rex quidam nostris temporibus.* *Disquis. Magicæ*, lib. iv. § 2. p. 559. He then refers for further particulars to an *ingeniosum opus* with which we have never chanced to meet, by Stephanus Forcatulus, a distinguished lawyer, who cites abundantly from the Civilians. Neither are we able to explain the allusion to the Crowned head who went mad in consequence of his profane curiosity; but perhaps it was that Prince from whose Court a Necromancer was carried away in the manner Del Rio's authority, Giovanni Francesco Pico, has related. *A Dæmone, quinquaginta fermè ab hinc annis, vivum asportatum nusquam comparuisse, dum curioso cuidam et malè sano Principi Trojæ oppugnationem repræsentare quasi in scenâ pollicitus esset, Achillemque et Hectorem introducere præliantes.* *De Superstitiosâ Prænotione*, iv. 9.

NECROMANCY.
NECTAR.

NECROPHORUS, in Zoology, a genus of *Coleopterous* insects.

Generic character. *Antennæ* rather longer than the head, slender at the base, and terminating suddenly in a large ovate perfoliate club, composed of four coarctate joints, the last of which is acuminate; head with a distinct neck; *thorax* suborbiculate, rounded behind, transversely-truncate anteriorly; *elytra* truncated in a straight line, with a marginal channel, not carinated; body oblong, much longer than broad; *tibiæ* short, robust; posterior *trochanters* sometimes with a spine at the apex; anterior *tarsi* dilated and furnished with long cilia in the males.

Type of the genus, *Silpha germanica*, Linnæus; Curtis, *Britt. Ent.* vol. ii. pl. lxxi. Nearly twenty species, of which seven are found in England; they frequent carcasses, especially of the smaller mammalia, which they bury beneath the surface, and in them deposit their eggs, which become hatched in the putrid remains, and their *larvæ* reside in them until their period of change arrives, when they seek for a spot in which to become *pupæ*.

NE'CTAR,

NECTA'REAL,

NECTA'REAN,

NE'CTARED,

NECTA'REOUS,

NE'CTARINE,

NE'CTAROUS.

Fr. *nectar*; It. *nettare*; Sp. *nectar*; Lat. *nectar*; Gr. *νέκταρ*. *Ambrosia*, says Vossius, is the name of the food of the Gods; and *nectar*, of their drink: the Etymology unsettled. See Vossius in *v. Ambrosia*; and *Νέκταρ* in Lennep. Applied to Any liquor of excessive sweetness, or excessively delicious. And the fruit (*Nectarine*) so called from its pleasing taste.

More sweet than *nectar*, or ambrosiall meat,
Seem'd every bit which thenceforth I did eat.

Spenser. Sonnet 39.

The sweet peace-making draught went round, and lame Ephæstus fill'd
Nectar to all the other gods.

Chapman. Homer. *Iliad*, book i. fol. 13.

Fair, flowry name; in none but thee
And thy *nectareal* fragrancy,

Hourly there meets

An universal synod of all sweets.

Crashaw. To the Name above every Name.

A *nectarean*, a balsam kiss.

Burton. *Anatomy of Melancholy*, p. 535.

NECTAR.

Loe, whilst the vine tree great with grapes,
With nectar'd liquor strives to kisse
Embracing elms not lov'd amisse,
Those clusters lose their comely shapes.

Stirling. Choruses in the Tragedy of Croesus. Chorus 5.

Who [Nereus] piteous of her woes, rear'd her lank head,
And gave her to his daughters to imbathe
In nectar'd layers strow'd with asphodel.

Milton. Comus, l. 839.

————— To their supper-fruits they fell,
Nectarine fruits, which the compliant boughes
Yielded them.

Milton. Paradise Lost, book iv. l. 332.

————— From the gash
A stream of nectarous humour issuing flow'd
Sanguin, such as celestial Spirits may bleed,
And all his armour stain'd ere while so bright.

Id. Ib. book vi. l. 332.

Choicest nectarean juice crown'd largest bowls,
And overlook'd the brim, alluring sight,
Of fragrant scent, attractive, taste divine.

Gay. Wine.

————— These conceal'd
By the kind art of forming Heaven, escape
The grosser eye of man; for, if the worlds
In worlds enclos'd should on his senses burst,
From cates ambrosial, and the nectar'd bowl,
He would abhorrent turn.

Thomson. Summer.

Then, in the nostrils of the slain she pour'd
Nectareous drops, and rich ambrosia show'd
O'er all the corpse.

Pope. Homer. Iliad, book xix.

Through all the brute creation, none, as sheep,
To lordly man such ample tribute pay.
For him their udders yield nectareous streames;
For him their downy vestures they resign;
For him they spread the feast.

Dyer. The Fleece, book ii.

Among the fruits that grace this little seat,
And all around their clustering foliage spread,
Here mayst thou cull the peach or nect'rine sweet,
And pluck the strawberry from its native bed.

Lloyd. An Imitation from the Spectator.

NECTAR, say the Etymologists, as the drink of the Immortals, may be appropriately derived from the negative particle *νή*, and *κῆρ*, death. Homer tells us (as above) that when Thetis was laying out the dead body of Patroclus, she dropped Nectar up his nostrils, to prevent rapid decomposition, and that its colour was that of red wine. (*Il. T. 38.*) So Calypso, when she entertains Mercury, pours out for him a goblet of red Nectar, *νέκταρ ἐρυθρόν*. (*Od. E. 93.*) Her own snug private luncheon afterwards consists of Nectar and Ambrosia, while she gives Ulysses more mortal viands. (*Ibid. 199.*) Polyphemus, also, a skilful judge both of the *bouquet* and the *borracchio*, swears that the draught presented to him by Ulysses smacks of Nectar and Ambrosia, *ἀλλὰ τόδ' Ἀμβροσίης καὶ Νέκταρος ἐστὶν ἀπορρώξ*. (*Od. I. 359.*) Little as we know therefore of the Feasts of Olympus, that little is enough to convince that they were in better taste than those of the pothouse and ale-bibbing Immortality of Valhalla.

But the Ancients were not altogether agreed concerning Nectar. Athenæus (lib. ii. p. 39. Ed. Casaub.) informs us that a composition under that name was made in the parts of Lydia adjacent to Mount Olympus, and that it consisted of wine, honey-combs, and fragrant flowers. Anaxandrides, he adds, considers Nectar to be esculent not potable, and Ambrosia, on the other hand, to be the drink of the Immortals.

NECTAR.

NEDDER.

τὸ νέκταρ ἐσθίω πάνν
μάττων διαπίνω τ' Ἀμβροσίαν καὶ τῷ Διὶ
διακονῶ, καὶ σιμῶς ἡμ' ἐκαστοτε,
"Ἡρῃ λαλῶν, καὶ Κύπριδι παρακαθήμινος.

Nectar I masticate

And crunch, and drink Ambrosia, while to Jove
I minister, and on both sides honour'd
I laugh with Juno and I sit by Venus.

A fancy in which he is supported both by Alcman, τὸ νέκταρ ἔδμεναι αὐτοῦς, and by Sappho,

Ἀμβροσίας μὲν κρατὴρ ἐκίκατο
Ἑμῶς δ' ἰλὼν ἔρπον θεοῖς οἰνοχόησιν.

Ambrosia mantled in the cup, and Hermes
Receiv'd the wine, and poured it for the Gods.

NECTARINIA, from the Greek *νέκταρ*, honey, Illig. *Sugar-eater*. In *Zoology*, a genus of animals belonging to the family *Tenuirostres*, order *Passeres*, class *Aves*.

Generic character. Beak about the length of the head, very delicate, slightly rounded, very pointed, more or less arched, and wide at the base; mandibles of equal length, their edges very finely toothed, those of the lower inclined inwards, and hidden by the upper; nostrils, basal, lateral, in part closed by membrane; tongue long, bifid, and extensible; legs of moderate length, the tarsus longer than the middle toe; the lateral toes united at the base; wings of moderate size, first quill very short, second long, but rather shorter than the third and fourth, which are very long.

The birds forming this genus are remarkable for the metallic lustre of their beautiful plumage, which varies according to age and sex; generally in pairing time that of the male is very brilliant, whilst the female is of a dull or dingy colour; they moult twice a year, and it is only at the very time of pairing that the male assumes his full plumage, which he changes immediately after for a more sober dress; whilst the females do not alter. They are very lively, active birds, and suck with their tongue the honied secretion afforded by numerous Asiatic and African flowers. They are found in the Old Continent and in the Asiatic Archipelago, among thick woods.

The different species have been already described as a subdivision of the genus *CERTHIA*, to which refer. They supply in the Old World the place of the Humming Birds, and that of the Guit-guits in the New.

See Illiger, *Prodromus Mammalium et Avium*; Temminck, *Manuel d'Ornithologie*.

NECTRIS, in *Botany*, a genus of the class *Hexandria*, order *Digynia*, Generic character: calyx six-parted, the three interior segments small, obtuse; corolla none; capsule fleshy, crowned with the style, one-celled, one and two seeded.

One species, *N. aquatica*, native of North and South America.

NEDDER, Goth. *nadr*; A. S. *neddre*; a serpent, an *adder*, *q. v.*; from A. S. *neothan*, low; neother, nether, or lower.

A name given to all the *serpentine* class.

For nedres ny other wormes ne mow ther be nogt.

R. Gloucester, p. 43.

O servant traitor, false of holy hewe,
Like to the nedder in bosom slie untrew.

Chaucer. The Marchantes Tale, v. 9660.

The beastes passen by the yearthes, by full diuers figures, for some of hem haue hir bodies straught, and crepen in the dust, and drawn after hem a trace, or a forough continued, that is to saie as *neders* and *snails*.

Id. Boecius, book v. p. 451.

NEDYUS. NEDYUS, in *Zoology*, a genus of *Coleopterous* insects.

NEED.

Generic character. *Antennæ* geniculated, twelve-jointed, rather short, slender; funiculus seven-jointed, its basal joint longer than the remainder, subobconic, the second elongate, rather slender, the rest short, subnodose; the club ovate, acuminate, quadriarticulate; head produced anteriorly into a rostrum, which is long, slender, curved, received during repose in a short pectoral groove, rarely extending beyond the base of the first pair of legs; *thorax* attenuated, and coarctate in front, sinuated posteriorly; *scutellum* minute; *elytra* subtriangular, shorter than the abdomen; body somewhat rhomboid, squamous; legs moderate; *femora* sometimes dentate; *tibiæ* truncate at the apex, and unarmed; *tarsi* tetramerous.

Type of the genus *Cu. Sysimbrii*, Herbst; Stephens, *Britt. Entom.* vol. iv. pl. xx. fig. 2. An extensive genus, of which about forty species are found in Britain; they frequent flowers, and in their first stage cause galls upon the roots of plants.

NEED, n.	} A. S. <i>nead</i> , <i>ned</i> , <i>nyd</i> ; D. <i>nood</i> , <i>noode</i> ; Ger. <i>not</i> ; Sw. <i>noed</i> . Wachter derives from Ger. <i>nauwen</i> , <i>coarctare</i> . Serenius from Sw. <i>neid-a</i> , (i. e. A. S. <i>nead-an</i>), <i>cogere</i> , <i>compellere</i> , <i>adigere</i> , to push, to drive, to compel; and of this A. S. verb Tooke also considers <i>nydde</i> to be the past participle. See NEEDLE.
NEED, v.	
NEE'DER,	
NEE'DFUL,	
NEE'DFULLY,	
NEE'DLESS,

NEE'DLESSNESS,	
NEE'DMENT,	
NEE'DY,	
NEE'DILY,	
NEE'DINESS,	
NEE'DERLY,	
NEEDS.	

Compulsion, necessity; extremity.
To be *needy* or in *need*; to be driven or compelled, or forced, to a state of want, to distress or poverty, and hence, consequentially,

Need is, want, poverty, penury, distress.

Needs, i. e. *need* is.

þo wende forþ þe toun folk, as heo moste *nede*.

R. Gloucester, p. 70.

Reufol he was to *neody* men, of hys almesse large and fre.

Id. p. 330.

He was boþe gode & wýs in alle his dedis,
& right vnderstandýng, to help at alle *nedis*.

R. Brunne, p. 35.

If he wild ouht haue, after his fader decesse,
Nedly him bihoued com tille Egþriht pes.

Id. p. 15.

Ich and mýne wolleþ fynd. hem þat hem *needeþ*.

Piers Plouhman. Vision, p. 135.

For all manere men. þat þei fyndeþ *nedfol*.

Id. Ib. p. 70.

But he moste *nede* delyuere hem oon by the feeste day.

Wiclif. Luke, ch. xxiii.

For if I preche the gospel glorie is not to me, for *nediliche* I mote doon it; for wo to me if I preche not the gospel.

Id. 1 *Corynth*. ch. ix.

And ghe witen the grace of oure Lord Iesus Crist, for he was maad *nedi* for ghou whanne he was riche, that ghe shulden be maad riche bi his *nedynesse*.

Id. 2 *Corynth*. ch. viii.

His frendes sent he to, at his instance,
And praied hem to don him that plesance
That hastily they wolden to him come;
He wolde abregge hir labour all and some:
Neded no more to hem to go ne ride.

Chaucer. The Marchantes Tale, v. 9489.

For he nought helpeth *needful* in hir *nede*.

Id. The Man of Lawes Tale, v. 4523.

VOL. XXV.

To asken helpe thee shameth in thin herte,
If thou non ask, so sore art thou ywounded,
That veray *nede* unwrappeth al thy wound hid.

Chaucer. The Man of Lawes Tale, v. 4523.

But natheles hire thoughte that she dide,
That she so longe shuld a conseil hide;
Hire thought it swal so sore aboute hire herte,
That *nedely* som word hire must asterte.

Id. The Wif of Bathes Tale, v. 6550.

A man most *nedes* love maugre his hed:
He may not fleen it, though he shuld be ded.

Id. The Knightes Tale, v. 1171.

And euery thyng by wey of kinde
Shall sterue, and erth it shall become,
As it was out of erthe nome
It shall to earth tourne ageine,
And thus I may by reason seine,
That therthe is most *nedeles*.

Gower. Conf. Am. book i. p. 42.

Thus hath she fulliche ouercome
Myn idelnesse till I sterue,
So that I mot hir *nedes* serue
For as men seyn, *nede* hath lawe.
Thus mot I *nedely* to hir drawe.

Id. Ib. book iv. p. 103.

They had all that they *neded*, at his coste and charge.

Lord Berners. Froissart. Cronycle, vol. i. ch. xxxiii. p. 47.

Now therefore yf the obieccion be frutlesse, and therfore thanswer *needelesse*, & verily frutlesse to: now to reply thereto were labour halfe lost & more.

Sir Thomas More. Workes, fol. 945. The Debellacion of Salem and Byzance.

The bread of the *needy* is the life of the poore, and he that defraudeth him of it is a murtherer.

Frith. Workes, fol. 81. A Mirrour or Glasse to know thyselſe.

Upon the losse of these thyngs, folowe *nedinesse* and pouertie, the payne of lackyng.

Sir Thomas More. Workes, fol. 1218. The Thirde Booke of Counfort against Tribulacion.

Wherefore ye must *needes* obey, not for feare of vengeaunce onely: but also because of conscience.

Tyndall. Workes, fol. 116. The Obedience of a Christian Man.

Which [the voyage of Salomon's navy] being performed by coasting, *needed* perchance more time, but lesse skill in navigation.

Hakewill. Apologie, book iii. sec. 4. fol. 271.

Neither is it *needful* to remember that some of my countrymen doo reckon their times not by years but by summers and winters, which is verie common among vs.

Holinshed. The Description of England, vol. i. ch. xxiv. p. 441.

And he more *needfully* and nobly prove

The nation's terroure now than erst their love.

Crashaw. A Hymn in the glorious Epiphany.

And bicause the ilanders were not able to ouercome them [conies] Augustus was constrained to send an armie of men to destroe that *needlesse* brood.

Holinshed. The Description of Britaine, vol. i. ch. x. p. 57.

How many ignorant souls, from the misprision of God's infallible election, have argued the *needlessness* of their endeavours, and the safety of their ease and neglect.

Hall. Sermon 44. The Christian's Assurance of Heaven.

Behind her farre away a dwarfe did lag,

That lasie seem'd in being ever last,

Or wearied with bearing of her bag

Of *needments* at his backe.

Spenser. Faerie Queene, book i. can. 1.

By which reason it followeth, that *needlie* great inconuenience must fall to that people, that a child is ruler and gouernour of.

Holinshed. Richard II. Anno 1399. vol. ii. p. 866.

For which her present haste, have scarcely time to greet her;

But earnest on her way, she *needsly* will be gone.

Drayton. Poly-olbion, song 4.

And like a graceless and untutor'd lad,

Art now departed from my aged sight,

And *needsly* to the Southern fields wilt gad

Where thou dost live in thriftless vain delight.

Id. Pastorals. Eclogue 6.

NEED. Their *nedinesse* and pouertie is such that without mercie they will robbe, murther and slay you, your wiues and children, & set fire on your beautifull city.
NEEDLE. *Stow. Henry VIII. Anno 1527.*

Before this cursed throng goes Ignorance,
That *needs* will lead the way he cannot see.
Fletcher. Christ's Victory in Heaven.

"Yet, lady, still remember I maintain
The word in *needful* points is only plain."
"Needless or *needful*, I not now contend,
But still you have a loop-hole for a friend,"
Rejoin'd the matron.

Dryden. The Hind and the Panther.

This sacred book, even where it hath not embellishments of language, doth not want them; being so much recommended by its imperious persuasiveness without them, that it is more ennobled by their *needlessness* than it would by their affluence.
Boyle. Works, vol. ii. p. 320. Considerations touching the Style of the Holy Scriptures.

It is evident that nothing can be more amiable, suitable, and universally subservient both to the *needs*, and to the refreshments of the creature, than light.
South. Sermons, vol. iv. p. 388.

I would not enter on my list of friends,
Tho' grac'd with polish'd manners and fine sense,
Yet wanting sensibility, the man
Who *needlessly* sets foot upon a worm.
Cowper. The Task, book vi.

NEE'DLED, } Ger. *nadel*; Sw. *nael*. The dimi-
NEE'DLER, } nutive of *need*.
NEE'DLE-WORK. } A small instrument pushed, driven,
forced into.

For ge ben men beter y tagt to schouele and to spade,
To cartestaf and to plowstaf, and a fischyng to wade,
To hamer and to *nedle*, and to marchandise al so,
þan with swerd or heuberk eny batail to do.
R. Gloucester, p. 99.

For semivivus he semede
As naked a *neelde*. and non help aboute hym.
Piers Plouhman. Vision, p. 324.

Thome þe tynker, and tweye of hus knaves
Nike Hakeneýman. and Houwe þe *neldere*.
Id. Ib. p. 106.

It is lighter a camele to passe through an *nedlis* yghe than a riche man to entre into the kyngdom of God.
Wiclif. Mark, ch. x.

It is easier for a camel to go through the eye of an *needle* then for a rych man to enter into the kyngdome of God.
Bible, Anno 1551.

With curious *needle-worke*,
A garment gan she make,
Wherin she wrote that bale she bode,
And al for bewties sake.
Gascoigne. The Complaynt of Phylomene.

That the load-stone should by his secret virtue so drawe yron to it selfe, as that a whole chaine of *needles* should all hang by insensible points at each other, only by the influence that it sends downe from the first, if it were not ordinary, would seeme incredible.
Hall. Works, vol. i. fol. 43. Meditations and Fows, Con. 3. 18.

Whether her *needle* play'd the pencil's part;
'Twas plain from Pallas she deriv'd her art.
Gay. Ovid. Metamorphoses, book vi.

Some fickle creatures boast a soul
True as a *needle* to the pole,
Their humour yet so various—
They manifest their whole life through
The *needle's* deviations too,
Their love is so precarious.
Cowper. Friendship.

With nobler gifts of native worth adorn'd,
The heroic maid her sex's softness scorn'd;
Scorn'd each impertant toil of female hearts,
The trickling ornament and *needled* arts.
Brookes. Jerusalem Delivered, book ii.

One of them, named Mary, distinguished herself by admirable *needle-work*, a piece of which used to be exhibited on festivals in the church of St. Nicholas at Aberdeen.

Walpole. Anecdotes of Painting, vol. ii. ch. iii. p. 185.

NEESE, v. } A. S. *nies-an*, to neeze or sneeze.
NEE'SING, n. } D. and Ger. *nies-en*; Sw. *nysa*. All,
says Ihre, a *sternutationis fonte*, naso. A. S. *næse*.
We commonly say,
To sneeze, *q. v.*

And the y^e lad *nesed*. vii times, & opened his eyes.

Bible, Anno 1551. 4 Kings, ch. iv.

His *nesinge* is lyke a glistering fyre, and his eyes like the mornyng shyne.
Id. Job, ch. xli.

When *neezing* thou on Joue
for succour seemste to crie
Thou canst not heare, thy nose debarres
the noyse to eare to flie.

Turberville. Of one whose nose was bigger than his hand.

And then the whole quire hold their hipps and loffe,
And waxen in their mirth, and *neeze*, and sweare
A merrier houre was neuer wasted there.

Shakspeare. Midsummer Night's Dream, fol. 149.

NEF, of a Church. See **NAVE**.

NEFANDOUS, Lat. *nefandum*, that ought not to be spoken, *fari*; too impious, too wicked, to be told.

The Press restrain'd! *nefandous* thought!
In vain our sires have nobly fought:
While free from force the press remains,
Virtue and Freedom cheer our plains,
And Learning largesses bestows,
And keeps uncensur'd open house.

Green. The Splcen.

NEFA'RIOUS, } Lat. *nefarius*, from *ne*, and *fari*,
NEFA'RIOUSLY. } not to be spoken: too bad to be
spoken or told; and, consequentially,
Extremely or excessively wicked; infamous.

So we plant glory and renown,
Where it was ne'er deserv'd nor known,
But to worse purpose, many times,
To flourish o'er *nefarious* crimes,
And cheat the world.

Butler. To the Memory of Duval.

The unknown author of the said *Way to Bliss*, thus totally, thus *nefariously* rob'd and despoiled of his honour, did therefore publish the perfect copy.
Wood. Athenæ Oxonienses, fol. 891.

If there are slaves to pity blind,
With power enough to plague mankind,
That for their own *nefarious* ends,
Tread upon Freedom and her friends,
Let 'em beware the Witch's fate!

Cunningham. The Witch.

NEGA'TION, } Fr. *negation*, *negatif*; It. *nega-*
NE'GATIVE, adj. } *zione*, *negativa*; Sp. *negacion*, *ne-*
NE'GATIVE, n. } *gativa*; Lat. *negatio*, from *negare*,
NE'GATIVE, v. } (*ne-go* quasi *ne-ago*, Vossius;) to
NE'GATIVELY. } say no or not, to deny, to refuse.

Negation,

A denial or refusal; a saying or declaring that a thing shall not be, is not or has not been.

Other badness no beyng hath vtterlie, it is in the *negative* of somewhat, and that is naughte, and nothings beyng.

Chaucer. The Testament of Loue, book ii. p. 497.

But the *negatife* hereof in badness is holden, as the lady of loue hath me learned, who so aright in this booke loketh.

Id. Ib. book iii. p. 506.

But I founde therein no answer appoynted to be made to them whyche receyued that ordre, neyther by affirmacion nor yet *negation*.

Bale. Apologie, fol. 23.

For where in the secod booke of his worke, entretyng transubstantiation, he would the same words of Chrisostome by this fourme of speache in the *negative* should not denye precisely.

Stephen, Bishop of Wynchester. Explication of the true Catholique Fayth, p. 68.

TION.
—
NEG-
LECT.

So I saie againe, that I weigh not two chips which way the wind bloweth, bicause I see no inconuenience that may insue either of the affirmatiue or *negative* opinion.

Holinshed. Description of Ireland, vol. vi. ch. ii. p. 17.

My wife is slipperie? If thou wilt, confesse,
Or else be impudently *negative*,
To haue nor eyes, nor eares, nor thought; then say
My wife's a hobby-horse.

Shakspeare. Winter's Tale, fol. 280.

We will not say (as you are wont) argue from Scriptures *negatively*.

Hall. Works, vol. i. fol. 546. *An Apologie against Brownists*, sec. 20.

It is disputed, I know, in Natural Philosophy, whether the sense being duly qualify'd, and the object as duly proposed, and the medium fitted to both, the sense can be deceived in the apprehension of its object; and it is generally held in the *negative*.

South. Sermons, vol. v. p. 174.

For the words speak *negatively*, yet this is a known rule in divinity that there is no command that runs in the strain of *negatives*, but couches under it a positive duty.

Id. Ib. vol. viii. p. 183.

It is not like alledging a new law of Nature, or a new experiment in Natural Philosophy, because when these are related, it is expected that under the same circumstances the same effect will follow universally; and in proportion as this expectation is justly entertained, the want of a corresponding experience *negatives* the history.

Paley. Evidences, vol. i. p. 9. *Preparatory Considerations*.

Mr. Sheridan on the 4th of March, 1793, moved that the House should resolve itself into a Committee, to consider of the seditious practices, &c. referred to in his Majesty's Speech, declaring at the same time openly and freely that his intention was to constitute a rigorous enquiry into the truth of the reports so insidiously circulated. The motion of Mr. Sheridan was *negatived* without a division.

Belsham. History of Great Britain, Geo. III. Anno 1793.

So in the very act of refusal, the mind chuses the absence of the thing refused; the positive and the *negative* are set before the mind for its choice, and it chuses the *negative*.

Edwards. On the Freedom of the Will.

NEGLE'CT,
NEGLE'CT, n.
NEGLE'CTION,
NEGLE'CTER,
NEGLE'CTFUL,
NEGLE'CTINGLY,
NEGLE'CTIVE.

Fr. *negliger*; Lat. *negligere*,
i. e. nec and *legere*; not to take,
or gather, not to choose, and thus
To disregard, to disesteem; to
slight, not to heed or care for;
to pass by inattentively, to omit.

As for fastyng, prayer, & such other thynges, he taught them to *neglecte* and set at naught as vayne & vnfruitful ceremonies.

Sir Thomas More. Workes, fol. 257. *A Dialogue concerning Heresies*, &c.

And then because it should not be *neglect* or left undone, an higher officer, as the Archdeacon, came about from parish to parishe at tymes conuenient.

Tyndall. Workes, fol. 276. *Answer to Sir Thomas More's Dialogues*.

I then all smarting, with my wounds being cold,
(To be so pestered with a poppingay.)
Out of my greefe, and my impatience,
Answer'd, *neglectingly*, I know not what;
He should, or should not.

Shakspeare. Henry IV. First Part, fol. 51.

And this *neglection* of degree, is it
That by a pace goes backward in a purpose
It hath to climbe.

Id. Troilus and Creseide, fol. 82.

It is not for us to affect too much cheapness and *neglective* homeliness in our evangelical deuotions.

Hall. Holy Decency in the Worship of God.

As he who having found great treasury,
The first year offers with most grateful cheer,
A sheep of gold to Juno's deity;
And next of silver, for a second year:
The third of brass: and then *neglectively*
Nothing at all.

Daniel. History of Civil Wars, book viii.

Thus said, he turn'd, and Satan bowing low,
As to superiour Spirits is wont in Heaven,
Where honour due and reverence none *neglects*,
Took leave.

Milton. Paradise Lost, book iii. l. 738.

But O, my virgin lady, where is she?
How chance she is not in your company?

E. B. To tell thee sadly, shepherd, without blame,
Or our *neglect*, we lost her as we came.

Id. Comus, l. 510.

But Christianity has backed all its precepts with eternal life and eternal death to the performers or *neglecters* of them; whereas philosophy could do nothing, but by taking in the assistance of fabulous stories, or by telling men that virtue was a sufficient reward to itself.

South. Sermons, vol. vii. p. 99.

Thy absent spouse, *neglectful* of thy charms,
Prefers his barbarous Sintians to thy arms!

Pope. Homer. Iliad, book viii.

His lovely daughter, lovelier in her tears,
The fond companion of his helpless years,
Silent went next, *neglectful* of her charms,
And left a lover's for her father's arms.

Goldsmith. The Deserted Village.

NE'GLIGENT,

See NEGLECT, *ante*.

NE'GLIGENCE,

Fr. *negligence*; It. *negligenza*;

NE'GLIGENTLY.

Sp. *negligencia*; Lat. *negligentia*.

Negligent, one who neglects, disregards, disesteems, slights, heeds or cares not for, passes inattentively, omits: regardless, heedless, careless, inattentive.

His hondes, through hure gretnesse, shewethe sumwhat vnwyȝt and *negligence*.

R. Gloucester, p. 482. note.

I trowe men wolde deme it *negligence*,
If I foryette to tellen the dispençe
Of Theseus, that got so besily
To maken up the listes really.

Chaucer. The Knightes Tale, v. 1886.

I wol with Thomas speke a litel throw;
Thise curates ben so *negligent* and slow
To gropen tenderly a conscience.

Id. The Sompnoures Tale, v. 7398.

Fulfilled of slouthes exemplair,
There is yet one his secretair,
And he is cleped *Negligence*:
Whiche woll not loke his euidence,
Wherof he maie beware to fore.

Gower. Conf. Am. book iv. p. 101.

And now, if he be of God accursed, y^t *negligently* doth his worke, how much is he more accursed that casteth his work away and leueth it quite vndone, such worke, I say, as thei be bounde to do?

Sir Thomas More. Workes, fol. 208. *A Dialogue concerning Heresies*, &c.

That night the legion remoued, fires being left here and there *negligently* vnput out, part of Turin was burnt.

Savile. Tacitus, book ii. ch. xxi. fol. 84.

This paper has vndone me, 'tis th' accompt
Of all that world of wealth I haue drawne together
For mine own ends, indeed to gain the Popedome,
And see my friends in Rome, O *negligence*
Fit for a foole to fall by.

Shakspeare. Henry VIII. fol. 221.

O *negligent* and heedlesse discipline,
How are we park'd and bounded in a pale.

Id. Henry VI. First Part, fol. 111.

Britain! whose genius is in verse express'd,
Bold and sublime, but *negligently* dress'd.

Waller. Upon the Earl of Roscommon.

In the cool evening *negligently* laid,
Or near the stream, or in the rural shade,
Propitious hear, and, as thou hear'st approve
The gentle shepherd's tender tale of love.

Hamilton. To the Countess of Eglington.

NEGRO-
PONTE.

NEGO'TIATE, v.
NEGOTIA'TION,
NEGO'TIATOR,
NEGO'TIANT,
NEGOTIO'SITY.

Fr. *negotier*; It. *negotiare*;
Sp. *negociar*; Lat. *negotiar*,
from *neg-otium*, i. e. *nec otium*.
Vossius thinks *otium* from some
word which, like the Gr. *οἴον*,

signified alone, sole;

To be employed, occupied, busy; to manage or con-
duct business, to traffic; to manage or conduct a
treaty; to treat.

For certaine it is, shee was a busie *negotiating* woman.

Bacon. *King Henry VII.* fol. 21.

Finding how nearly it concern'd the State,
To stay a war both dang'rous and unjust;

That weighty bus'ness to *negotiate*,
They must find one of special worth and trust.

Drayton. *The Barons' Wars*, book iii.

Ambassadors, *negotiants*, and generally, all other ministers of
mean fortune, in conversation with princes and superiours must use
great respect.

Raleigh. *Arts of Empire*, ch. xxv.

In *negociations* of difficultie, a man may not look, to sow and
reap at once; but must prepare business, and so ripen it by de-
grees.

Bacon. *Essay* 47. p. 283.

And were this possible, yet would such infinite *negotiosity* be
very vnease and distractious to it, and altogether inconsistent with
happiness.

Cudworth. *Intellectual System*, book i. ch. v. fol. 884.

Those who have defended the proceedings of our *negotiators* at
the Treaty of Gertruydenburgh, dwell very much upon their zeal and
patience in endeavouring to work the French up to their demands;
but they say nothing to justify those demands, or the probability
that France would ever accept them.

Swift. *Works*, vol. ix. p. 127. *The Conduct of the Allies*.

He that *negociates* between God and man,
As God's ambassador, the grand concerns
Of judgment and of mercy, should beware
Of lightness in his speech.

Cowper. *The Task*, book ii.

Greatly superior to the gross ideas of Gothic conquest, he ad-
dressed himself to the reason and the interests of those with whom
he *negotiated*.

Mickle. *History of the Portuguese Empire in Asia*.

NEGRO, Fr. *negre*; It. and Sp. *negro*; Lat. *niger*.

We see also, that the *negroes* are bred in countries that have
plenty of water, by rivers or otherwise: for Meroe, which was the
metropolis of Ethiopia, was upon a great lake: and Congo, where
the *negroes* are, is full of rivers. And the confines of the river *Niger*,
where the *negroes* also are, are well watered.

Bacon. *Natural History*, Cent. iv. sec. 399. fol. 88.

NEGROPONTE (Black Bridge) is the modern
name of Eubœa, formed by the Italian seamen in the
Middle Ages, from the Greek phrase Is-tin-Egripon.
(Εἰς τὴν Ἐγρίπον.) By adding the syllable *te* to *Negripon*,
obtained by a misdivision of the above phrase, (Sti-ne-
gripon,) a significant word in their own Language
arose, and was referred by them to the bridge which
connects the Island with the Continent of Greece.
Chalcis, the Capital of Eubœa, restored by Justinian in
the VIth century, having been in the Middle Ages
(*Geogr. Min.* iv. 42.) called Euripus, from the strait
upon which it stood; that name was gradually ex-
tended to the whole Island, and subsequently corrupted
by the vulgar into E'gripos, (Ἐγρίπος for Ἐγρίπος,)
and into Eghribóz by the Turks.

The Civil and Physical condition of this Island in
ancient times having been already described under the
head of GREECE, its principal towns and subdivisions,
since it has been subject to the Turks, are all that need
be noticed here. As a part of their Empire, it forms
the thirteenth Sanjak, or Military District of the Páshalik
of Rúm-ílí, and its jurisdiction extends over the whole

of ancient Bœotia and Attica, including Ægina and NEGRO-
PONTE. the neighbouring islands. Eghribóz and Kizil-hisár are
the only Kádílik in the Negroponte itself. The first, NEIF.
called Chalkída also by the modern Greeks, is the Ca-
pital of the Island, a Metropolitan See, and strongly Eghribos.
fortified according to the Turkish system, as well Chalcida.
as the bridge which connects it with the continent.
Its walls enclose an area of about two miles in circum-
ference, but it was always thinly peopled; the Greeks
being obliged to live in the suburbs. The inhabitants
amounted to about 15,000 in the latter part of the
XVIIth century, and the Captan Páshá, to whose juris-
diction the Páshalik belonged, had a richly ornamented
Palace on the Euripus. At the end of the bridge, which
has five small arches, and crosses the strait, there is a
tower built by the Venetians, which communicates with
the city by a drawbridge, about thirty paces long, which,
when raised, barely leaves room for the galleys to pass.
(Spon, *Voy.* ii. 187.) Kizil-hisár, (Red Castle,) still Kizil hisar
called Cárystos by the Greeks, at the foot of Mount St. Carysto.
Elias, (Oches,) the highest peak in the Island, and
on a gulf lying between its two most Southern Pro-
montories, is an Episcopal See, subject to the Metro-
politan of Athens. It is built on a rock near the
sea, much exposed to the winds, and with respect to
population, is the second town in the Island. Cape
Cophareus, at the South-Eastern extremity of the Island,
called by the Italians Capo d'Oro, is named Xylophágo Capo d'Oro.
by the Greeks. Carystos was long possessed by the Xylophago.
Genoese and Venetians, and was supposed by Bondel-
monti (p. 133.) to have been founded by the former,
whom he calls Lombards. Few of the ancient towns
of Eubœa have been succeeded by places of any note,
and, although extremely fertile, and one of the richest
islands in the Archipelago, Negroponte is thinly in-
habited, and almost uncultivated.

Meletii *Geographia*; Danielis Hieromonachi, *Geo-
graphia Recentior*, Vien. 1791, tom. i.; Von Hammer,

NEGUNDO, in *Botany*, a genus of the class *Dioe-
cia*, order *Tetrandria*, natural order *Acerineæ*. Generic
character: calyx small, unequally four or five cleft; no
corolla; male flowers fasciculated on slender stems;
anthers four or five, linear, sessile; female flowers in a
raceme.

Three species, trees, natives of America and China.

NEGUS. See the Quotation.

The mixture now called *negus*, which was invented in Queen
Anne's time by Colonel *Negus*, was then unknown.

Malone. *The Life of Dryden*, vol. i. part i. p. 484. note.

NEIDES, in *Zoology*, a genus of *Hemipterous* in-
sects.

Generic character. *Antennæ* inserted above a line
drawn from the eyes to the base of the labrum, geni-
culated about the middle, four-jointed, the basal joint
very long, the last thick; head somewhat conic; neck
not apparent; *scutellum* minute, linear-conic; body
filiform; legs elongate; *femora* clavate; *tarsi* triarti-
culate.

Type of the genus, *Cimex tipularius*, Linnæus;
Wolff, *Cim.* pl. xx. fig. 198. About six European spe-
cies, of which four are indigenous.

NEIF, Scotch *neive*, *neif*; Sw. *knäffe*, *pugnus*, the
hand with the fingers contracted into the palm. In
Islandic *kno*; and Ihre thinks it may have the same

NEIF.
—

BOUR.

origin as *knee*, (*i. e.* the A. S. *hnig-an*, to bend,) and hence its application, from the bending of the joints of the fingers.

CLO. Giue me your *neafe*, Monsieur Mustardseed.
Shakspeare. Midsummer Night's Dream, fol. 157.

TUC. I wu' not, my good two-penny rascall: reach mee thy *neufe*.
Do'st heare? *Ben Jonson. Poetaster*, act iii. sc. 4.

NEIFE, *n.* The Quotation explains the origin and meaning of the word.

The children of villeins were also in the same state of bondage with their parents; whence they were called in Latin, *nativi*, which gave rise to the female appellation of a villein, who was called a *neife*.
Blackstone. Commentaries, book ii. ch. vi. p. 94.

NEIGH, *v.* } A. S. *hneg-an*; D. *neyen*; Sw.
NEIGH, *n.* } *gnæga*. These (as well as the Lat.
NEIGHING. } *hinnire*, with the Fr. and It. deriva-
tives) Skinner and Lye believe a *sono ficta*.
To utter the cry of the horse.

He letteth hym selfe be drynen forth like a grasshopper, where as the stoute *neyenge* that he maketh is fearfull.

Bible, Anno 1551. Job, ch. xl.

When as unwares he in the forest heard
A trampling steede, that with his *neighing* fast,
Did warne his rider be uppon his gard.
Spenser. Faerie Queene, book vi. can. 5.

CONST. Hearke how our steedes, for present seruice *neigh*.
Shakspeare. Henry V. fol. 86.

Steed threatens steed, in high and bostful *neighs*
Piercing the night's dull eare.
Id. Ib. fol. 83.

When now the sprightly trumpet, from afar
Had given the signal of approaching war,
Had rous'd the *neighing* steeds to scour the fields,
While the fierce riders clatter'd on their shields.
Dryden. Virgil. Æneid, book viii.

The coursers *neigh*, the clanging arms resound,
And deafening hills return the din around.
Brookes. Jerusalem Delivered, book i.

NEIGHBOURLY, *adj.* } tryman. See BOOR.
NEIGHBOURLY, *adv.* } To be, dwell, or abide near;
close to, or at small distance from; to border upon or
adjoin to, to connect closely with.

Neighbourly; having qualities convenient, becoming,
or suiting, a *neighbour*; or to those who live *near* each
other; friendly, social, kind.

To driue & to gaderi thuder god of *neizebores* aboute.
R. Gloucester, p. 538.

But he, willinge to justifie himsilf, saide to Jhesus, and Who is
my *neighbore*.
Wiclif. Luke, ch. x.

He wyllinge to iustifie hym selfe, sayd vnto Jesus: Who is then
my *neighbour*.
Bible, Anno 1551.

And yet, God wot, my *neighebores* aboute,
And namely of women many a route,
Sain that I have the most stedefast wif,
And eke the mekest on that bereth lif.
Chaucer. The Marchantes Tale, v. 9423.

That ye maye lerne your daughters to mourne, and that euery
one may teache her *neighbour* to make lamentacion.
Bible, Anno 1551. Jeremie, ch. ix.

Three dayes wee fought, as long as water serued,
And came to ancor *neighbourlike* yfeere,
The Prince himselve to see who best deserued,
Stoode euery day attending on the peere.
Gascoigne. The Fruites of Warre, st. 137.

For both that Antioch upon Orentes, and that which *neighboureth*
Emesa, are farther off seated from Canaan; than any of those na-
tions stragled.

Rulegh. History of the World, book i. ch. viii. sec. 7. fol. 94.

A thousand sithes, I curse that carefull houre,
Wherein I long'd the *neighbour* towne to see.
Spenser. Shepherd's Calendar. January.

Till towards night they came unto a plaine,
By which a little hermitage there lay,
Far from all *neighbourhood*, the which annoy it may.
Id. Faerie Queene, book vi. can. 5.

I intreat you both,
That being of so young dayes brought vp with him:
And since so *neighbour'd* to his youth and humour,
That you vouchsafe your rest heere in our Court
Some little time.

Shakspeare. Hamlet, fol. 260.

Who being *neighbourly* admitted by the courtesy of England to
hold possessions in our province, a country better than their own,
have proved ingrateful and treacherous guests to their best friends
and entertainers.

Milton. Works, vol. ii. p. 359. *Observations on the Articles of
Peace.*

It is I, who by slighting and slubbering over her holy service and
sacraments, have scandalized and cast a stumbling-block before all
the *neighbourhood*, to the great danger of their souls.

South. Sermons, vol. v. p. 489.

While from the *neighbouring* rock, with rural songs,
The pruner's voice the pleasing dream prolongs.
Dryden. Pastoral 1. Tityrus and Melibæus.

NEILLIA, in *Botany*, a genus of the class *Icosan-
dria*, order *Pentagynia*, natural order *Rosaceæ*. Ge-
neric character: calyx five-cleft, segments cuspidate,
persisting; corolla, petals five; stamens in a double
series; capsules bag-formed, crowned with the styles,
many seeded.

Two species, shrubs, natives of Nepaul.

NEITHER, *adj.* } A. S. *nather*, *nouther*, from *ne*,
NEITHER, *conj.* } not, and *either*, *q. v.*

Which man hadde an hous in birielis and *noither* with cheynes
now mighte ony man bynde him. *Wiclif. Mark*, ch. v.

For *nother* after his deth, ne in his lif
Ne wold he that she were no love ne wif,
But ever live a widewe in clothes blake.
Chaucer. The Marchantes Tale, v. 9951.

For as to me nis lever none ne lother,
I nam withholden yet with never *nother*.
Id. The Legend of Good Women. Pro. p. 300.

For out of the scripture shall he be able to proue *neyther* *nother*.
Frith. Workes, fol. 58. *Answer vnto Fisher, Bishop of Rochester.*

Moreover, extreme heat and thirst did marvellously cumber the
Gaules, who were used to abide *neither* of both.

Sir Thomas North. Plutarch, fol. 478. *Crassus.*

Satan, I know thy strength, and thou knowest mine,
Neither our own but given.
Milton. Paradise Lost, book iv. v. 1007.

Thus they in mutual accusation spent
The fruitless hours, but *neither* self-condemning,
And of their vain contest appear'd no end.
Id. Ib. book ix. v. 1188.

A frozen style, that *neither* ebbs nor flows,
Instead of pleasing, makes us gape and doze.
Dryden. The Art of Poetry, can. 1.

Such pow'rs I boast not, *neither* can I rest
A silent witness of the headlong rage,
Or heedless folly, by which thousands die,
Bone of my bone, and kindred souls to mine.
Cowper. The Task, book iii.

NELITRIS, in *Botany*, a genus of the class *Icosan-
dria*, order *Monogynia*, natural order *Myrtaceæ*. Ge-
neric character: calyx, tube ovate, border four or five

NEIGH

TRIS.
—
NEME-
OBIUS.

toothed; superior; corolla, petals four or five; stamens fixed in a narrow circle at the base of the calyx; style filiform; stigma capitate; capsule four to ten celled.

Three species, natives of the Southern hemisphere.

NELOCIRA, in *Zoology*, a genus of *Isopodous Crustacea*.

Generic character. *Antennæ* four, the interior triarticulate; eyes four, granulated; mandibles horny; *abdomen* composed of five segments, its hinder extremity with a fin on each side composed of laminae, the outer ones of which are larger than the internal; legs formed for walking.

Type of the genus, *N. Swainsonii*, Leach; *Desm. Crustacea*, 302. Found in the Mediterranean Sea.

NELUMBIUM, in *Botany*, a genus of the class *Polyandria*, order *Monogynia*, natural order *Nymphaeaceæ*. *Generic character*: calyx four or five leaved; corolla petals many; nuts one-seeded, crowned by the persisting style; receptacle truncated, immersed.

One species, the magnificent *N. speciosum*, the sacred bean of India; the fine large flowers and elegant foliage of this water plant, a native of both Indies, has caused it to be much cultivated, especially in China, where costly vases are employed for the purpose.

NEMATOCERA, in *Zoology*, a genus of *Dipterous* insects.

Generic character. *Antennæ* porrect, filiform, six-jointed, the basal joint cylindric, the second cup-shaped, the following cylindric, equal, elongate; *ocelli* wanting; *palpi* exserted, incurved, four-jointed, with the articulations equal; wings two; body elongate; legs long and slender; *tarsi* five-jointed.

Type of the genus *N. bicolor*; Meigen, *Dipt.* vol. i. p. 209. pl. vii. fig. 1—4. One species, a native of Europe.

NEMATUS, in *Zoology*, a genus of *Hymenopterous* insects.

Generic character. *Antennæ* simple, gradually attenuated to the apex, nine-jointed, larger than the body in the males, the articulations generally a little thickened and slightly produced within, at the apex, the terminal joint being acute; in some instances slightly ciliated within; head rather broad; body short, of the male a little attenuated behind; wings four; anterior with one marginal and four submarginal areolets; legs rather long, slender; *tarsi* simple.

Type of the genus, *Pteronius niger*; Jurine, *Hymen.* 60. pl. vi. genus 5. About sixty species, nearly forty of which are British. The *larvæ* of some of them form galls upon leaves, others subsist upon the leaves openly; the genus therefore is evidently an artificial one, and requires subdivision.

NEMEOBIUS, in *Zoology*, a genus of *Lepidopterous* insects.

Generic character. *Palpi* two, horizontal, very short, hairy, three-jointed, basal joint minute, short, stouter than the following, which is elongate, nearly cylindric, a little curved at the base, terminal joint truncate-conic, nearly half as long as the second; *antennæ* terminated by a short, compressed club; anterior wings short, triangular; posterior suborbicular, denticulated; anterior legs imperfect, very hairy, in the male short; resembling the others in the female; *tarsi* with minute, simple claws; posterior *tibiæ* without spurs; *larvæ* fleshy, not tubercular or spinous; *pupa* with the head case obtuse.

Type of the genus *Pa. Lucina*, Linnæus; Donovan, vol. vii. pl. 242 fig. 2. Inhabits Europe and Britain: one species only.

NEMEOPHILA, in *Zoology*, a genus of *Lepidopterous* insects.

Generic character. *Palpi* extremely short, enveloped in the hairs of the forehead, triarticulate, the joints of nearly equal length, subglobose, the basal largest, the terminal smallest, and slightly compressed; *maxillæ* very short; *antennæ* rather slightly bipectinated in the male, the pectinations shortening towards the apex; serrated and ciliated in the female; head small, very pilose; *thorax* and *abdomen* rather slender, the former with elongated hairs in the male, the latter stoutest and acute in the female, tufted at the apex in the male; wings deflexed, opaque, scaly; legs rather short; anterior *tibiæ* with a spine on the inside, posterior with a spine at the apex; *larvæ* cylindric, slightly tuberculated, each tubercle producing a fascicle of hair; *pupa* with a truncate projection.

Type of the genus *Ph. Bo. Plantaginis*, Linnæus; Donovan, *Brit. Ins.* vol. iv. pl. 134. Two species, found in Europe in woods and in Alpine situations; one of them not uncommon in England.

NEMESIA, in *Botany*, a genus of the class *Didynamia*, order *Angiospermia*, natural order *Scrophulariæ*. *Generic character*: calyx five-parted, corolla with a spur, palate prominent; capsule compressed, truncated, bursting longitudinally in the middle, two-celled, two-valved, seeds numerous, linear.

Five species, natives of the South of Africa.

NEMESTRINA, in *Zoology*, a genus of *Dipterous* insects.

Generic character. *Antennæ* three-jointed, remote, the two basal joints transverse, subequal, the terminal short, conic, terminated by a setiform, elongate, triarticulate style; head transverse, hemispheric; eyes oval; *ocelli* remote, placed in a large triangle; *palpi* exserted; *proboscis* very long, distinctly attenuated and acuminate towards the apex, porrect and slightly depending; *abdomen* trigonal; wings two, the apex thickly reticulated; *tarsi* with three pulvilli.

Type of the genus *N. reticulata*; Latreille, *Gen. Crust. et Ins.* vol. iv. pl. xv. fig. 5, 6. Three species, one of which is a native of Egypt and the adjoining Countries; the others of the warmer regions of Europe.

NEMOICUS, in *Zoology*, a genus of *Coleopterous* insects.

Generic character. *Antennæ* geniculated, twelve-jointed, rather slender, the basal joint reaching beyond the eyes; the two basal joints of the funiculus of nearly equal length, somewhat elongate, the remainder shorter and slightly obconic, the club elongate-ovate; head produced anteriorly into a short rostrum, which is rather stout, with the tip a little narrowed; eyes rounded, prominent; *thorax* small, slightly elongate; body pilose, furnished with wings; *elytra* elongated, slightly convex, clothed with a few hair-like scales, the apex rounded; legs rather long, stout, subequal; *femora* rather thick at the apex, and armed with a stout tooth; *tibiæ* curved.

Type of the genus *Curculio oblongus*, Linnæus. Stephens, *Britt. Entom. (Mandibulata)*, vol. iv. p. 146. One species, a native of Europe and of England, frequenting hedges.

NEMOPTERYX, in *Zoology*, a genus of *Neuropterous* insects.

Generic character. *Palpi* six, short; *antennæ* setaceous, inserted between the eye; *ocelli* wanting; head vertical; *clypeus* produced into a rostriform, perpendi-

NEMEO-
PHILA.
—
NEMOP-
TERYX.

NEMOPTERYX. cular lamina, bearing the trophi; body elongate, narrow; *thorax* composed of two segments, the first very short, the second large; wings reticulated, extended, anterior ones somewhat ovate, posterior very long and linear; legs short; *tarsi* elongate, composed of five slender, entire joints; claws elongate and simple.

Type of the genus, *N. lusitanica*, Leach, *Zool. Misc.* vol. ii. p. 74. pl. lxxxv. fig. sup. Several species, of which the *Panorpa coa* of Linnæus is one; they inhabit the warmer regions of Europe and the North of Africa.

NEMOROUS, Lat. *nemorosus*, from *nemus*, a wood, a grove.

Woody.

Paradise itself was but a kind of *nemorous* temple, or sacred grove. *Evelyn*, book iv. sec. 4.

NEMOSOMA, in *Zoology*, a genus of *Coleopterous* insects.

Generic character. *Antennæ* rather longer than the head, the basal joint stout, ovate; the second less robust, short; the five following very short, gradually incrassated; the eighth and ninth large, truncate, perfoliate; the tenth also very large, ovate, and with the eighth and ninth forming a triarticulate club; *palpi* subequal, filiform, the terminal joint much larger than the others, subcylindric, and slightly acute at the apex; mandibles stout; head very large, elongate, sulcate anteriorly, as broad as the *thorax*, the latter subcylindric, as long as the head; eyes small, lateral, somewhat immersed; body linear, elongate, cylindric; legs rather short, stout; *tarsi* tetramerous.

Type of the genus, *Dermestes elongatus*, Linnæus. *Latreille*, *Gen. Crust. et Ins.* vol. iii. p. 13. pl. xi. fig. 4. Inhabits Europe, beneath the bark of decaying trees, and has been found abundantly near London and in Shropshire.

NEMOTELUS, in *Zoology*, a genus of *Dipterous* insects.

Generic character. *Antennæ* half the length of the head, porrect, triarticulate, inserted at the conic apex of the hypostoma; the two basal joints short, equal, the third elongate, composed of four rings, and furnished at its apex with a two-jointed style; *scutellum* unarmed; wings two, placed horizontally during repose; *abdomen* large; *proboscis* concealed beneath the conic process of the hypostoma.

Type of the genus, *N. uliginosus*, Fabricius. Meigen, *Dipt.* vol. iii. p. 114. pl. xxv. fig. 16—20. Eight species, of which six are indigenous; they frequent damp and marshy places.

NEMOURA, in *Zoology*, a genus of *Neuropterous* insects.

Generic character. *Antennæ* rather longer than the body, setaceous; *palpi* filiform, the terminal joint oval-cylindric; *labrum* subquadrate; a little rounded at the sides; mandibles horny, unequally multidentate towards the apex; *labium* elongate-cordate-quadrate, rather broader at the base than in the middle, the apex dilated and more membranaceous, subtrilobate; head rather stout, somewhat vertical; legs moderate; *tibiæ* and *tarsi* elongate, the latter simple.

Type of the genus, *Phryganea nebulosa*, Linnæus. Several species found in Europe, sixteen of which are found in Britain. See Stephens's *Catalogue of British Insects*, part i. p. 315.

NEOLOGY, } Gr. *neos*, new, and *lógos*, a word.
NEOLOGICAL, } Fr. *néologie*.

A new word; coining, introducing, using new words. They endeavour by a sort of *neology* of their own to confound all ideas of right and wrong. *Boothby on Burke*, p. 266.

I seriously advise him [Dr. Johnson] to publish by way of appendix to his great work, a genteel *neological* dictionary, containing those polite, though perhaps not strictly grammatical, words and phrases, commonly used, and sometimes understood, by the beau monde. *Chesterfield. Miscellaneous Works*, vol. ii. p. 64. *The World*, No. 32.

NEOMENY, Fr. *neomenie*. *Neomenia*, used by the Latin Fathers. *Néa, μήνη*, the new moon.

Therefore no man iuge ghrou in mete or in drynke or in part of feest dai or of *neomenye* or of sabotis whiche ben schadowe of thingis to comynge, for the bodi is of Crist.

Wiclif. Colocensis, ch. ii.

NEOPHYTE, Fr. *neophyte*; It. *neofito*; Sp. *neophyto*; Lat. *neophytus*; Gr. *νεόφυτος*, *néos*, new, and *φύτον*, from *φύειν*, to bear.

One newly implanted; sc. in the Church, and consequentially, newly converted to the Christian faith; one newly initiated, newly introduced or employed.

Nay in effects of grace, which exceed far the effects of nature, we see St. Paul makes a difference between those he calls *neophytes*, that is, newly grafted into Christianity, and those that are brought up in the faith.

Bacon. Works, vol. ii. p. 187. *Of the Union of Laws*.

There stands a *neophyte* glazing of his face,
Pruning his clothes, perfuming of his haire
Against his idoll enters; and repeats
(Like an unperfect prologue, at third musick)
His part of speeches, and confederate jests,
In passion to himself.

Ben Jonson. Cynthia's Revels, act iii. sc. 4.

It is with your young grammatical courtier, as with your *neophyte* player, a thing usual to be daunted at the first presence or interview. *Id. Ib.*

NEO'TERICK, } Gr. *νεωτερικὸς*; from *νεώτερος*,
NEOTE'RICAL, } comp. of *néos*, new.

New, novel, modern; of the present time, or time not long past.

That the heavens are void of corruption, is Aristotle's supposal; but the tube hath betray'd their impurity; the *neoterick* astronomy hath found spots in the sun.

Glanvil. The Vanity of Dogmatizing, ch. xviii. p. 174.

I refer you to the voluminous tomes of Galen, Aretæus, Rhasis, Avicenna, Alexander, Paulus, Aëtius, Gordonius, Guianerius: and those exact *neotericks*, Savonarola, Capivaccius, &c.

Burton. Anatomy of Melancholy, fol. 7.

Galen reckons up these ordinary symptoms, which all the *neotericks* repeat of Diocles.

Id. Ib. fol. 199.

I will say this, that whosoever crieth it down for a new *neoterical* opinion, as divers do, commit a grosser error than the opinion may be in its own nature.

Howell. Letter 9. book iii. p. 424.

NEOTTIA, in *Botany*, a genus of the class *Gynandria*, order *Diandria*, natural order *Orchideæ*. *Generic character*: calyx ringent, the exterior lateral leaves placed under the ventricose lip; anthers parallel with and inserted behind the style.

Seventeen species of elegant archideous plants. *N. spiralis* is the *Ophrys spiralis* of English Botanists.

NEPA, in *Zoology*, a genus of *Neuropterous* insects.

Generic character. *Antennæ* very minute, concealed, inserted beneath the eyes, triarticulate; *rostrum* perpendicularly inflected; body very much depressed, oval, furnished at the apex with two long setæ; eyes globose-ovate, narrowed anteriorly; *thorax* subquadrate, deeply emarginated; legs various; two anterior with very short coxæ; *femora* incrassated, ovate-conic; four posterior not elongate-filiform; *tarsi* cylindric.

Type of the genus *N. cinerea*, Linnæus. *Donovan*, vol. i. pl. xviii. Inhabits ponds and ditches in Europe.

NEOLO-

GY.

NEPA.

NEPAUL.

NEPAUL. Name.	NEPAUL, NÉPÁLA, or NÉPÁL, which has been variously spelled Napaul, Neypaul, Nypaul, Nipal, or even Nekbal, according to the whim or error of the transcriber, is the name of a large tract of country to the North of Aúd'h (or more properly Awad'h, but commonly written Oude) and Bahár. The origin of this name, which often occurs in the Puránas, or Mythological Poems of the Hindús, is very doubtful, but is perhaps derived from a Muni or Saint, named Niya or Niyama Pála, who with his eight descendants is said to have governed the Country during the Trétá and Dwápar Yugs, (the Silver and Brazen Ages,) and was probably the first Hindú Chief who made himself master of the Country above the G'háts, or mountain defiles. The territory of Népál, as extended by its most successful and encroaching Princes, occupied the valleys or Table land between the higher and lower ridges of mountains, stretching from North-West to South-East, between 80° and 88° East, and from 27° to 29° North, being bounded by the great Himálaya range, on the North; the parallel chain of hills which separates it from the British dominions, on the South; the Kálí River, on the West; and the Méchi with the Territory of Sikim, on the East. The greater part of this territory lies beyond the limits of the valley properly called Népál, and the whole is now subdivided into the following Districts: 1. The Báisi (or 22) Rájás; 2. The Chaúbisi (or 24) Rájás; 3. Népál Proper; 4. Makwan-púr; 5. Khatang; 6. Kiráts; 7. Cháyan-púr; 8. Sap-tari; 9. Mórang.	is rich and productive, being on the latter formed into terraces, to prevent its being washed away by the rains. The kinds of grain commonly cultivated are úyá d'hán and púyá, (rice,) pangdú koda, or márúya (<i>Cynosurus coracanus</i> ;) sana koda, (<i>Paspalum kora</i> ;) mukkaí, muruli, or kaunguni; (a variety of <i>Sorghum vulgare</i> ;) the pulse are, urid, kálá más, or maí; (<i>Phaseolus minimoo</i> ;) sétá más, or chika maí; (<i>Ph. occultatus</i> ;) lato, or rato más, or haingu maí; (<i>Ph. calcaratus</i> ;) lál mung; (<i>Ph. racemosus</i> ;) mung, múk, or mágí; (<i>Dolichos mungo</i> ;) sétá and kálá b'hót más, or musa and gya; (<i>Dol. soya</i> ;) mosúri, or mosú; (<i>Eroum lens</i> ;) kerao, or kaigo; (<i>Pisum arvense</i> ;) sarisha, or turi; (<i>Sinapis dichotoma</i> ;) ika; (rájiká? <i>Sinapis ramosa</i> .) Til, or hamo, (<i>Sesamum</i> ;) grows wild and is little cultivated; puli; (ginger;) mulu, or kipo; (radishes;) mé't'hi; (fenugreek, <i>Trigonella fenum Græcum</i> ;) khirá and kangkari (cucumbers and gourds) and garlic are much cultivated. Bérá, (<i>Solanum melongena</i> ;) and in the hills the common potato, (<i>Solanum tuberosum</i> ;) are generally to be found; the sakar-kand (<i>i. e.</i> sugar-candy, properly sugar-root, <i>Convolvulus batatas</i>) succeeds better, (Buchanan, p. 230.) and is probably a greater favourite with the natives. Ganja, or charas (<i>Cannabis sativa</i>) grows wild every where, and is much used in intoxicating liquors.	NEPAUL.
Boundaries			
Subdivisions.			
Mountains.	The range of mountains which forms the Southern boundary of Népál, though containing many peaks of great height, is far inferior in elevation to the Northern range, or culminating chain of Himálaya, (<i>Imaus</i> ;) which separates Népál from the Table land of Tibet, and gives rise to the largest rivers, descending into Hindústán. These streams force their way through the Southern and secondary range; the higher parts of which are covered with forests of pine, oak, chestnut, walnut, and yew, while rhododendrum, mimosa, (especially catechu,) sál, (<i>shorea</i> ;) sisú, (<i>dalbergia</i> ;) and tún (<i>cedrela</i>) trees clothe the lower ridges and hills, as they gradually sink into the plain. It is from these forests that most of the parrots and parroquets hawked about for sale in Bengál are brought. The valleys in the Western, but not in the Eastern part of these hills are called <i>dún</i> , a term nearly equivalent to the <i>Wádi</i> of the Arabs and <i>Strath</i> of the Scots: the narrower valleys, however, are seldom inhabited from their extreme insalubrity, occasioned by want of circulation in the air and excess of humidity; for where the forest has been sufficiently cleared away, the country ceases to be unhealthy. Though scarcely any where North of latitude 28°, the highest points in these hills are often covered with snow for a short time in Winter, and the temperatures and, consequently, the productions of the valleys, vary extremely. In Népál Proper, as it is subject to the periodical rains, European fruits do not succeed without shelter, the Spring being too short to ripen them before the wet season sets in; but oranges and pine-apples come to a high degree of perfection. The soil in the valley and on the sides of the hills	The whole of the valley or low land in Népál consists of alluvial soil, entirely free from stones, and formed of vegetable mould, or a blue ferruginous earth, interspersed in some places with beds of fine gravel and fine micaceous sand. The higher mountains are chiefly granitic, and contain much iron, lead, and copper, with some zinc and a little gold; the lower ranges are composed of limestone, but not sufficiently pure to be reducible by calcination to quick-lime, so that clay or mud alone is used for mortar. The iron and copper ores are near the surface and easily worked; corundam of an inferior kind is found in great quantities in the hills of Isma and Músikót, (Buchanan, p. 79.) in Arg'ha, near the Barigar River and in the Chaúbisi Rájá's territory; native cinnabar, called <i>sabita</i> , is brought from the mountains; there are many sulphur mines, which contain arsenic, and from a precipice on the banks of Gand'hakí, the <i>sál-gráms</i> , or sacred stones so much venerated by the Hindús, are washed down: they consist of carbonate of lime, probably with some metallic admixture, are quite black, with a few white veins, and very heavy. Most of them are ammonites, half embedded in a matrix of exactly similar stone. The most valuable are those which enclose only the hollow impression of the ammonite, called <i>chakra</i> , or wheel, by the Hindús. The breadth of the mountainous-belt which separates Népál from Tibet varies from fifty to eighty miles across from North to South. Peaks, covered with perpetual snow, are scattered over a tract of thirty or forty miles in width, between the valley of Népál and the Tibetan Alps, of which the towering and precipitous peaks are almost always concealed by clouds from the low lands beneath: but the country on the Northern side of the range is said to be hilly, not mountainous, and as might be inferred from its extraordinary	Soil.
Valleys.			Minerals.
Productions.			Saul-graums.
			Breadth of mountains.

NEPAUL. elevation and icy barriers, it is in a state of perpetual Winter. D'hólá-giri, (or D'hawala giri,) the highest peak visible from Bengál, is supposed to be scarcely less than 27,000 feet above the level of the sea, and therefore more than 7000 feet higher than the summit of the Andes. The

Cattle. mountain pastures, though far from rich, afford herbage for large flocks of sheep, especially those termed b'haral, which have very fine wool; horned cattle are scarce; buffaloes are brought from the plains, and not bred in the mountains; and what is more extraordinary, all the hogs and goats are imported from the plains of Hindústán. The chaúrí ox, (*Bos grunniens*), shawl-goat, and horse are never bred on the Southern side of Himálaya. The maral (*Meleagris satyra*) and damp'-hiya. (*Phasianus Impeyanus*), very beautiful species of the turkey and pheasant tribes, as well as the rufous partridge, (chakur,) are found only in the colder regions.

Birds. Primitive races. All the various Tribes inhabiting this Country appear to be derived from two races: the original natives of the mountains, whose features and complexion show their consanguinity with the people of B'hútán, on the opposite side of the chain, and the descendants of their Hindú conquerors from the South. It is almost exclusively to the East of the Káli (the Western branch of the G'hag'hra,) that any remains of these aboriginal Tribes can now be traced; and they occupy the less accessible parts of the different tracts named above.

1. Baessee Rajahs. 1. The Báisí Rájás, or 22 Rájás, occupy a territory divided into as many petty Principalities, all subject to the Górk'has who have conquered Népál. Their Country is bounded to the North-East and South-West by Himálaya and the lower parallel chain; and to the East and West by the Ráptí and Káli Rivers. It has never been visited by Europeans, and is therefore little known. Its subdivisions are: 1. Yúmila, on the River Karanáli or Salasu; 2. Achám; and 3. Chám, on the Western and Southern declivities of the first snowy range; 4. Duti, on the Swétá Gangá, (White Ganges,) another tributary to the Sarayú, or G'hag'hra; 5. Jajar-kót; and 6. Bángp'hi, between the Salasu and Jehári, other tributaries to the same river; 7. Jehári, between the B'héri and Jehári; 8. Rugun; 9. Músi-kót; 10. Sata-tála; 11. Mala-néta; 12. Dáng; 13. Saliyána, or Khásánt; 14. K'hungri; 15. B'hingri; 16. Ch'hilli, West and South of the Mári, a tributary to the Ráptí; 17. Piut'hana, between it and the J'hing-ruk, another branch of the same river; 18. Baliháng; 19. D'harma; 20. Gajal, near Jahári; 21. Dulu dailek; 22. Rólpa. The Capital is probably Mat'ha-gar'hi, or Bilás-púr, and "the most remarkable thing in this petty territory," says Dr. Buchanan-Hamilton, (p. 281.) "is the place of worship called Dalu Basandra," (Vaséndra?) where there are three hot-springs, supposed to issue from the head, navel, and feet of Vishnu, nearly four miles asunder, each of which emits an inflammable vapour.

2. Chow-beesee Rajahs. 2. The Chaúbísí (24) Rájás to the East of the former, between the Ráptí and the Gandakí which separates them from Népál Proper, all acknowledged the supremacy of the Yúmila Chief, which appears to have been almost their only bond of union, for they were not joined in any confederacy, or by the ties of a common origin. These twenty-four Rájás were probably the Chiefs of the following States:

- | | |
|------------------------|---------------|
| 1. Pyut'hána. | 4. Ismá. |
| 2. Malébúm, or Parbat. | 5. D'húr-kót. |
| 3. Gal-kót. | 6. Músi-kót. |

VOL. XXV.

- | | |
|----------------------------|----------------|
| 7. A'rg'há. | 16. Garahúng. |
| 8. Gulmi. | 17. D'hór. |
| 9. K'hánci, or K'háchi. | 18. Tanahúng. |
| 10. Pálpá. | 19. Rising. |
| 11. Nayá-kót, or Nawá-kót. | 20. Gajar-kót. |
| 12. Sata-húng. | 21. G'hiring. |
| 13. Póin. | 22. Lamjún. |
| 14. B'hir-kót. | 23. Tarki. |
| 15. Káski. | 24. Górk'ha. |

Of these the most distinguished is Górk'ha, properly occupying the fork between the Marichángdi and Trisul-Gangá Rivers, and bounded on the North-East by the mountains from which those rivers descend. Its territory is watered by various streams, and its Capital, on the summit of a lofty hill, supposed to be in 27° 52' North and 84° 22' East, is said to have about 10,000 inhabitants, and is adorned with a Temple to Górak'h-nát'h its tutelary Deity. Its rulers, a little more than half a century ago, succeeded in subduing, first, their neighbours the Névárs in Népál Proper, and subsequently almost all the petty Chiefs around them, so that, for a time, their rapidly-increasing Empire seemed likely to endanger the security of every contiguous State.

3. Népál Proper consists of two delightful valleys, separated by the Chandra-giri, (Lunar Mountain,) called Great and Little Népál, but forming only a part of the Népála Désa of the Puránas and other Hindú Poems, which appears to have extended from the Gandakí on the West, to the Kósí or Kaúsikí on the East. Its real boundaries are Nil-kant'ha, eight days' journey North-West of Kat'hmandu; Kálésvara, two days' journey West; Nát'hésvara, three days' journey South; and B'hímésvara, four days' journey East; all celebrated places of pilgrimage, giving a peculiar sanctity to the land of piety (D'harma) lying between them. The Vág-mati, or Bág-mati, flowing through the midst of this territory, receives many tributary streams, and, thus enlarged, forces its way through the lower range of hills into the Tariyáni, or low lands beyond them. The Valley of Népál, watered by these streams, is nearly circular, and, taken in its largest extent, measures about twenty miles from North to South, and twenty-two from East to West; but when the smaller and more elevated vales, formed by the projections of the surrounding hills, are excluded, that of Népál is reduced to a diameter of about fourteen miles each way. Its soil, as before remarked, is entirely alluvial, and it is intersected by shallow streams, flowing over sandy beds between banks sinking fifty or sixty feet perpendicularly from the plain which they traverse, so as not to be visible even at a small distance. There can be little doubt that this valley was once the bed of a lake; and the memory of that fact seems to be preserved in the mythological traditions still current both among the Budd'hists and Bráhmans; but as each Sect has its own fabulous account of the rent made in the mountains in order to afford a passage for the stream, it may well be doubted whether the fable was not derived from the natural phenomena of the Country, rather than from any tradition respecting the evacuation of the lake. (Buchanan, 206.) Two hills, once probably islands in the lake, are highly venerated; the one called Samb'hu, or Swayamb'hunát'h, is covered with stately groves embosoming Temples of the Budd'hists; the other, not quite so high, is crowned by Temples to Pasu-pati-nát'h (Siva) and his spouse Guhyéswarí; this hill, which is much visited by pilgrims, is washed by the sacred Vág-mati, in whose

NEPAUL.

3. Nepaul Proper.

NEPAUL. water every Népálese Hindú wishes his feet to be immersed at the moment of his dissolution. Though its most Northern point does not pass beyond 27° 50' North, the climate of this valley is scarcely less temperate than that of Portugal or Italy: a peculiarity occasioned in part by its elevation, which appears by barometrical observations to be at least 4874 feet* above the level of the sea, and partly by the vicinity of the perpetual snows of Himálaya. The average heat is 64° of Fahrenheit's thermometer: but the recurrence and duration of the periodical rains, which last nearly throughout the Summer, are a great drawback upon the comfort and health of its inhabitants. Rice is the grain chiefly cultivated, and a very awkward, clumsy hoe the implement commonly used, but agriculture and farming of every kind are in a very rude state. The trade with Hindústán has probably increased since the military and encroaching spirit of the Government has been repressed, and might, if judiciously regulated, become very considerable. The exports from Népál are rice, ginger, terra Japonica, (*i. e.* the gum, or inspissated juice of the *Mimosa catechu*), turmeric, bark and leaves of the bastard cinnamon, (*singraúli*, *Laurus Japonica*, Rumph.) large cardamoms, long pepper, oranges, walnuts, cotton of the simul, (*Bombax heptaphyllum*), honey, wax, lamp-oil, dammar, (resin, or turpentine,) g'hí, (clarified butter,) timber, hides, and elephants' tusks: the imports, raw silk, British and Indian manufactures, spices, metals, camphor, tobacco, chillies, (capsicums,) and coral; but their amount is very small, and, in 1808, the balance in favour of Népál was paid in silver. The hills and Taríyání, or low country, on the borders South of the lower range, are thinly inhabited; the latter, in consequence of its extreme unhealthiness, occasioned, as the natives suppose, by the poisonous breath of serpents, but in reality by an excessively humid atmosphere charged with the effluvia of putrid vegetables. (Buchanan, p. 65.) The valleys, therefore, are the only part of the Népálese State well peopled. The amount of the population cannot easily be ascertained, especially as the natives are disposed to exaggeration; but Kat'hmandú has probably 20,000, Lalitá patan 24,000, and B'hát-gáóng 12,000 inhabitants; and they are the three principal towns. The valleys and cities are occupied principally by Népárs,† apparently a mixed race of Hindú and Tibetan origin, fond of commerce and agriculture, and more civilized than the neighbouring Tribes. They are for the most part Budd'hists, and those who have embraced the Religion of the Bráhmans, are very negligent in the observances of its rites, and pay little or no regard to the Sacred Order. The Budd'hists of this Country differ in many respects with regard to their ceremonies, and in some points of doctrine, from those of the same Faith elsewhere, and great light has been thrown upon their tenets and practices by the assiduous inquiries of Mr. Hodgson, the British Resident in that Country. (*As. Res.* xv. and xvi. *As. Trans.* ii. 222. lxxvii. *Nouv. Jour. Asiat.* vi. 81. vii. 97.) They have

Religion.

NEPAUL. adopted the distinctions of caste, but reject the priesthood and most of the tenets of the Hindús, by whom they are considered as outcasts and impure. They are much given to intoxication, and eat voraciously many kinds of animal food, though the slaughter of the sacred ox is rigidly prohibited. Their houses and persons are excessively filthy, and few nations are more regardless of the chastity of their women. Their priests are styled Achárs, (Acháryas,) or Bangrás, the latter being the most numerous. Distinctions of caste are no where more rigidly observed, and though the mere eating and drinking with a Christian or a Musulmán is punished with loss of caste, and the entire dissolution of all ties of blood and affection, yet masters often sell their female slaves, and parents their children, to Mohammedans, who gladly avail themselves of that method of gratifying their passions, while they have the merit of propagating their Faith. (Buchanan, 37.) "The Népárs," says Dr. Buchanan, (p. 43.) "are a peaceable people, and not so much addicted to assassination as the Párbatiyas, (Mountaineers,) but possess all the other vices of that barbarous race." They appear, in fact, to have engrafted many of the vices, as well as the absurdities, of the Hindú system upon that of the Budd'hists. The most Northern of all the mountaineers are the Gurung, who in Summer inhabit the Alpine region, in Winter the lower hills and valleys near the Káli to the North-West of Népál Proper. They are followers of the Tibetan Lámás, and therefore more orthodox Budd'hists than the Népárs. They live on both sides of the snowy peaks, mix much with the B'hótiyas, use the hoe in their field-work, are diligent traders and miners, employ their sheep as beasts of burden, (Buchanan, 27.) and are subdivided into many Tribes, Nisi, B'huji, G'hali, T'hagsi, &c. South of the Gurungs and West of Népál is the numerous race of the Jariyas, said to speak a peculiar dialect, and, by intermarriage with a Bráhman, to have obtained the rank of K'hásiyas, or pure Hindús. The lower ranges of hills in this quarter are principally occupied by the Magars or Mangars, who appear to have readily admitted the Ráj-pút Chiefs from Northern Hindústán, and to have adopted in some degree their customs and Religion, as they generally take Bráhmans and Sannyásis (devotees) for their spiritual directors. They eat pork and most other kinds of animal food, except beef, are drunken, cruel, and treacherous, but have great vigour both of body and mind. The unconverted have priests called Dami, worship departed Spirits, and marry only one wife. Their Language has no affinity to the Sanskrít or Párbatiya, (*i. e.* Common Mountain Prákrít.) Most of the regular troops belong to this Tribe, which was in all probability that of the Górk'has who conquered Népál; but they pretend to be Hindús from Chitaur, and their followers are often said to be Kshatriyas, though if so, many of them have forgotten their native Language. It is, however, widely spoken in their original Country, where they were divided into twelve T'hums, or Clans, and where they still retain their pristine Faith and usages. They are believed by Dr. Buchanan-Hamilton, (p. 52.) a very acute observer, to be of Tibetan origin. In the more rude and mountainous parts of Népál Proper, the chief population consists of Murmis, by many considered as a branch of the B'hótiyas, or people of Tibet, whose religion they profess. They are called Siyéna B'hótiyas (*i. e.* carrion-eating Tibetians) by the Górk'has, by whom they are persecuted, on account of

Gooroong.

Jareas.

Muggers, or Mungurs.

Mocmees.

* Mr. Colebrooke (*As. Res.* xii. 275.) has stated this somewhat differently, marking 4784 as the height of Kat'hmandú above the sea, but in the preceding page (274.) that number is given as its height "above the plains of Bengál;" and it appears from a note in the same page that the level of those plains at Calcutta is 90 feet above the sea; that sum, therefore, has here been added to 4784.

† That is Nepalese, for Népár and Népári are evidently local or provincial corruptions of Népál and Népáli, the Sanskrít and Hindu terms.

NEPAUL. their love of beef. They are a very robust but unwarlike and agricultural people, maintained by husbandry, or by their labour as porters, till driven to their fastnesses in the mountains by the ill usage of the Górk'has. Their houses are thatched, and raised on stages, as is common in the Countries East of Hindústán. Their Language is supposed by Dr. Buchanan to have been the parent of the more polished Népálí or Nepalese. East of Népál Proper are the Kirátas or Kichaks, a rude but warlike and enterprising Tribe, who have only been partially converted by the Lámás and Ráj-púts. They are much addicted to eating beef, and, consequently, are detested and persecuted by the Górk'has. The Limboos, who were settled among the Kirátas, and appear to have resembled them in habits and customs, but are said to speak a different Language, are for the most part unconverted. To the East of the Kirátas, between the Kámkayí and the Tístá, are the Lapchas, a set of vigorous Barbarians, about one half of whom have been converted by the Lámás. They eat all kinds of food, are much given to intoxication, and fight with swords and poisoned arrows. They are generally confounded with the Kirátas by the Hindús. Vocabularies of the Languages of most of these Tribes were collected by Dr. Buchanan, and deposited, with the rest of his papers, in the Library at the India House.

4. Muckwanpúr, South of Népál Proper and the San-kósí River, occupies a portion of the lower chain of hills and the Tariyání or plain at their Southern declivity. A great part of this territory has a rich soil, but it is much overgrown with wood, and infested by wild beasts, especially elephants and rhinoceroses. The breadth of the plain is about twenty miles, and the hilly tract above it extends through nearly an equal space. These hills rise gradually, are intersected by many streams, and are occasionally rocky, the rocks being covered with calcareous incrustations, like lichens, but where there is soil enough they are clothed with forests of pines. The inhabitants of the low lands closely resemble the neighbouring Hindús; but are more filthy and ill-favoured. Their strongest places are Makwan-púr, or Makám-púr, on a high hill, in 27° 27' North and 35° 1' East, the possession of which commands a large part of the Tariyání. Hari-Hara-púr, commanding the Vág-mati; Síndullí, or Sídlí, and Chísápání (6540 feet above the sea) command two much frequented passes through the mountains to Kat'hmandú; and Bárágar'hí (*i. e.* Twelve Forts) commands the plain; but as fortresses they are in reality all contemptible.

5. Khatáng, between the Arun and Tábá Kósí Rivers, the latter of which separates it from B'hát gáóng, one of the three Principalities into which Népál was divided at the time of the Górk'ha conquest, is North of the Lámádángra mountains, and has several forts or towns, considered as important by the Népálese. Its chief place is Dalka, or Dolkha, on the Tábá Kósí, containing about 4000 inhabitants, and a celebrated Temple of B'hím Sén, one of the Pándus. Its principal fort is Khatáng, or Hedáng, where the Górk'ha Viceroy resided. Kalésí, at the junction of the Dud'h Kósí and San Kósí, has a celebrated Temple of Siva, and a great Fair is held there in the month of February.

6. The Kirátas, already mentioned, appear to have been anciently much more considerable than in later Ages, and to have occupied not only the Country between Népál and B'hóta, (Tibet,) but to have extended their conquests over Kám-rúp and Matsya, now a part

of the districts of Dináj-púr and Rang-púr, in the NEPAUL. Súbah or Province of Bengál. The few Kirátas, or Kichaks, who are scattered over the Northern parts of that Province and Bahár, exactly correspond in their habits and occupations with the Gipsies of the Western World.

7. Cháyan-púr, the Easternmost Province of the Górk'ha dominions, is separated by the Méchí River from the territory of the Rájá of Sikim, and extends from thence Westward to the Arun, being bounded to the North and South by the lofty hills between those streams. Its whole surface is extremely rugged, and its Northern portion consists of an almost inaccessible Alpine region thinly inhabited. Its principal town is Cháyan-púr, supposed to be in 27° 18' North and 87° East.

8. Sap-tarí, (Sapt-taráí?) once a part of Makwan-púr, is now united with Mahá-tarí in one Súbah. The Zila' or Division of Sap-tarí, is placed under one Faújdár, or Revenue officer, and contains thirteen Parganahs, (districts,) four of which were, in 1809, entirely unproductive, and the remainder paid a land-rent of 29,881 rupees. (£3000.) Mahátarí, under another Faújdár, contains only four Parganahs, and paid 38,208 rupees. (£3820.) The total annual revenue from this Province was not less than 185,559 rupees. (£18,550.) The greater part of the population in the low lands is of the Thárú caste. In the hills there are various Clans of the other Tribes already named, beside Sríngúyas and Bártars, whose language is Hindí.

9. Mórang, the South-Eastern Súbah, formerly comprehending Sikim, lay between the Kósí and Kámkí, at the foot of the hills to the North of Púráníya. Its Southern boundaries were ill defined till the Treaty concluded with Népál, in 1816. Its Northern districts are covered with thick forests, which give shelter to the cattle in the hot season, and furnish abundance of timber, especially of the Sál, (*Shorea robusta*), which excels in solidity, durability, and fragrance. Vijaya-púr, on the highest ground, and therefore the most healthy part of the Súbah, is the residence of the Súbah-dár, and its fort is garrisoned with regular troops. In a wood near Kichak j'hár, the reputed residence of one of the legendary Chiefs of this Country, there are said to be ruins. Varáha Kshétra is a place of pilgrimage, where there is a celebrated Temple, erected in honour of the Varáha Avatár. In 1809, it was subdivided into three Ta'alluks, each under a Faújdár, or Collector, and yielding altogether a revenue of 131,425 rupees. (£13,142.) The inhabitants of the plains are of the same race as their neighbours in Bengál, and speak either the common Bengálí, or the Tirhutíya dialect. The hills are occupied by the Magars and other mountaineers, who, as before remarked, seem to form the link between the Hindús and the Tibetians. For the last sixty years, ever since the Górk'hálí Conquest, the Government of Népál has been a military despotism, after the Indian model. The Rájá's power over the persons and property of his subjects is only limited by the rules of the D'herma sástra, or Religious code, the construction of which, of course, rests with the Pandits, or Lawyers, dependent upon himself. For the administration of justice, he acts by his Káryí, (Vazír or Agent,) who considers the cases referred to him by the Bichárá; (or Dárághah;) but all business of importance is transacted by the B'háradár, or Great Council of State, consisting of the Chaúteríya, or Prime Minister, four Káryís, or Secretaries of State, four Serdárs, or Com-

NEPAUL. manders in Chief; two Khardárs, or Secretaries; one Kapardár, or Commissary; and one Khazáncí, or Treasurer. In cases of great emergency, a sort of Assembly of Notables is held, where men, not employed by the Government, are allowed to speak with great freedom, but their advice is rarely, if ever, followed. (Buchanan, 108.) The Chaúteriya is always the Rájá's nearest relation, and, therefore, when a minor, a mere puppet. The Káryís and Serdárs are usually chosen from distinguished families, and retain their titles, but not their office, during life. Some of the Serdárs usually have a military command in the Provinces, where their authority is very great, as they have the power of life and death. The great offices of State are almost exclusively held by thirty-six families of Górkhálís, who themselves are distinguished by three gradations, and form the Aristocracy of Népál. The army, which is divided into companies, commanded by officers styled Súbahdárs, is regularly formed in imitation of the European method, but very imperfectly trained and disciplined. Rather more than one half of the whole territory has been settled on the Bráhmans, for the maintenance of Religious foundations; of the remainder, a great part has been granted as military fiefs (jáigírs) to the soldiers and officers, to whom the Zemindárs, or farmers, pay their rent; when no such grant has been made, the rent is paid to the officers of Government, of whom the chief is the Súbah, or Collector, an officer of revenue and police. His agents, the Faújdár, or Ijárahdárs, collect the revenue by their Chaúd'harís, or Désálís, whose stipend seems to depend upon their immediate superior, and, under the name of Kharchah, (expenses,) both they and their superiors extort from the lower orders as much as they can. (Buchanan, p. 105.) The whole revenue, derived not only from land-rents but from presents, extraordinary assessments, fines, customs, and mines, never, probably, exceeded 3,000,000 rupees, (£360,000,) about two-thirds of which was assigned for the personal expenses of the Rájá, and the remainder divided, in certain fixed portions, between his servants; all the other officers and domestics being remunerated by fiefs, or feudal grants of land. Over every one, two, or three villages, which form a Gáóng or Township, there is an officer styled Umarà, Mukaddam, or Mahátó, and over every ten or twenty Gáóns, a Désálí, or Chaúd'harí, who is assisted by a Majamdár, (Majmú 'ahdár, or Accountant,) and, in case of unimportant suits, assembles a pancháyat, (or jury of five,) for the purpose of settling the difference; but in considerable cases, those officers refer the business to the Bichárí, or Dáróghah, from whose sentence there is an appeal to the Káryí, and through him to the Rájá himself. The punishment prescribed by the law is usually declared by the D'hermád'hikár. (Bearer of the ensigns of justice.) Oaths are rare, but trials by ordeal common. The five severe punishments under the Népál Government were, 1. confiscation; 2. banishment; 3. degradation; 4. amputation; and 5. death by cutting the throat; but the Górk'ha Princes have introduced other capital punishments, such as hanging and flaying alive, and though women are never put to death, they are subjected to most cruel and inhuman tortures. Fines inflicted for crimes or the neglect of ceremonies, are sources of revenue to the Rájá, his ministers, and five families of Bráhmans, who derive great wealth from the ritual transgressions of their inferiors.

Punishments.

History.

If any reliance can be placed on the ancient Hindú

legends, Népál owes its civilization as well as its name to Naya, or Niyam muni, who, with his eight successors, ruled the Country for 491 years. They were all called Gupta, (*i. e.* cowherd,) and were deprived of their power by a Ráj-pút, named B'hal Sing'ha, who came from Gar'h Samarán (or Semrún gar'h) and Jának-púr; he and his descendants were styled Gópála, (cowherds,) which is hardly consistent with their rank as Rájaputras. They were expelled by the Kirátas, who reigned for 1630 years, and were themselves driven out by a Kshatriya of the Súryavangsa (solar) race, whose thirty-three descendants ruled for 1702 years. They were Budd'hists, are called B'hótíyas, and, probably, bore the title of Varma; their power was subverted by the A'hirs, (cowherds,) descendants of the original native Sovereigns, who, after possessing the throne for 175 years, were displaced by the Varmas, whose power was retained for 1869 years; their posterity appears to have failed in the male line; and Hari Sing'ha Deva, Rájá of Samarán, (near Jának-púr,) the son of Rájá Lakshmí, the last of the Varma race, and grandson of Harihara Chandra Déva, Rájá of Benáres, is said to have driven out the Varmas or B'hótíyas, (Tibetians,) and introduced the Népálís, (Nepalese,) in the year 444 of their era, (*i. e.* A. D. 1323.) It is not improbable, as Dr. Buchanan-Hamilton has conjectured, (p. 190.) that Niyam Muni was the person who introduced the doctrines of Budd'ha among these rude mountaineers, about A. D. 93; that he was a disciple of Sákya Sing'ha, and that Hari Sing'h Déó, driven from his possessions in Tírab'hukti, or Tirhut, by the Musulmán Sovereigns of Dihlí, about A. D. 1323, made himself master of Népál, and engrafted many of the Bráhmanical usages upon the Religion of Budd'ha already established there. Ját Mal, the sixth in descent from Hari Sing'h, divided his Kingdom into three Principalities, Yin dés, Yalú dés, and K'hópó dés, afterwards called Kat'hmandú, Lalitá patana, and B'hát gáóng. Ranjít Mal, Rájá of the place last named, the seventh descendant of Ját Mal, formed an alliance against Kat'hmandú with Prít'hwi Naráyan, the Górk'ha Chief, who by that means made himself master of his ally's territories, in 1767. Some of the heads of the Górk'ha Tribe appear to have adopted the Hindú customs and rules of caste, and to have claimed a genuine Hindú descent, in consequence of intermarriage with Ráj-púts driven into the hills by the Musulmán. They were poor and despised till Nri-bhú-pál, or Nara B'hú-pála, by intermarrying with the reigning families of Pálpá and Malébúm, neighbouring States, increased his dignity, if not his power; and his son, Prít'hwi Naráyan, an able, enterprising, and ambitious man, availed himself, as already observed, of the dissensions of his neighbours, for the purpose of subverting their authority. He knew how to make himself beloved by his adherents, as well as feared by his enemies, and was as faithless and cruel as the worst of Asiatic conquerors. He owed much of his success to the use of fire-arms, but was too jealous ever to employ Europeans in his service. He not only conquered Népál, but several of the petty States to the West, and his sons and successors extended their dominion to the borders of Gar'hawál one way, and to Sikim the other. In 1790, Bahádur Sáhí, Regent during the minority of his nephew, Rana Bahádur, son of Prít'hwi Naráyan, having plundered the treasures of the Tíshú Lámá, brought an army of Chinese in pursuit of him, in 1792, and he was obliged to purchase a peace by engaging to pay a tribute to the

Pestee Nerayn.

NEPAUL. Emperor, Rana Bahádur, who soon afterwards imprisoned his uncle, and dissolved the Regency, was not less ambitious and encroaching than his immediate predecessors, and was also a monster of cruelty and ferocity. From superstitious motives, he determined, in 1797, to abdicate in favour of an infant son, and pass the remainder of his days in Religious retirement at Benáres; but he soon afterwards altered his mind, and endeavoured to resume his power. Not succeeding, however, as he expected, he finally gave way, and retired privately to that holy place in 1800. In 1804, he very unexpectedly returned to Népal, assumed the Regency, recommenced his encroachments, seized on Gar'hwál, and having by a repetition of his atrocities excited a universal odium, was publicly assassinated by an illegitimate brother, in 1805. Notwithstanding the intestine feuds which immediately succeeded, B'hím Sén, the Regent, continued, with the aid of Amar Sing'h, a bold and able General, to push the Górk'hálí conquests Westward, till their forces were checked by the Sik'hs. In 1814, they ventured to attack, without any provocation, the British stations of Górákhpúr and Sáran; and for a time had some success; but, in 1815, Sir David Ochterlony, who had taken the chief command, so completely baffled and penned up Amar Sing'h, the Nepalese Generalissimo, that he was glad to capitulate, and abandon the whole territory West of the Kálí. A Treaty to that effect was

concluded on the 28th of November, 1815; but the Rájá's Ministers wished to put off the ratification of it, so that it was necessary to send a strong force into his dominions in the following Spring, and the progress of this army was so rapid, that in one month and one day after it passed the frontier, an Ambassador reached the British camp entreating the Commander to accept the unratified Treaty of 1815. By it the boundaries of Népal to the East and West were fixed at the Méchí and Kálí, as stated above, and all disputable territories were relinquished by the Rájá, who consented not to engage any Europeans or Americans in his service without the approval of the British Government, and that accredited agents from each party should reside at their respective Courts. This Treaty was finally ratified on the 4th of March, 1816, and on the 20th of the following November, the young Rájá died of the small-pox, and was succeeded by his infant son, Rájéndra Vikram Sáhí, B'hím Sing'h T'hápá continuing to be Regent as before. The Chinese, though jealous of their authority in Tibet, do not appear to have ever claimed any tribute from Népal, or to have manifested any desire of annexing it to their Empire.

NE-
PHEW.

NEPENTHES, in *Botany*, a genus of the class *Dioecia*, order *Monadelphica*. Generic character: male flower, calyx four-parted, spreading, coloured on the inside; corolla none; filaments columnar; anthers fifteen to seventeen, connected; female flower, calyx and corolla as the male; stigma peltate, sessile; capsule four-celled, many seeded.

Three species, natives of the East Indian Islands. The most remarkable is the *N. distillatoria*. The leaves of this curious plant are lanceolate, furnished at the apex with a tendril-like continuation of the midrib of the leaf; this bears a sort of pitcher-shaped appendage, furnished with a lid like a tankard; this pitcher holds one or two ounces of fluid secreted by the plant, which is continually attracting insects, who perish in the fluid, and have been supposed to afford nourishment to the plant.

NEPETA, in *Botany*, a genus of the class *Didynamia*, order *Gymnospermia*, natural order *Labiatae*. Generic character: calyx arid, striated, tube of the corolla rather long, intermediate segment of the lower lip crenated, margin of the throat reflexed; stamens approximating.

Thirty-one species, mostly natives of the Northern hemisphere. *N. Cataria*, the Cat Mint, is a native of England.

NEPHELIUM, in *Botany*, a genus of the class *Monoecia*, order *Pentandria*, natural order *Corymbiferae*. Generic character: male flower, calyx five-toothed; corolla none; female flower, calyx four-cleft; corolla none; germens two, each with two styles; drupes dry, one-seeded.

One species, *N. lappaceum*, native of the East Indies.

NEPHEW, A. S. *nef*, *neuv*; Fr. *nepveu*, *neveu*; It. *nipote*; Sp. *nieto*: all, says Skinner, from the Lat. *nepos*. Junius derives from *νήπιος*, *infans*, one who cannot speak. In our old writers it is applied to

Grandsons; issue or descendants generally; now restricted to the sons of a brother or sister.

þo þe messenger wyþ þe tydýng to Kyng Howwel com,
Hýs conseyl wel hastelyche in such nede he nome;
Vor to helpe ys *neucu*, and ys kynedom.

R. Gloucester, p. 169.

So þat to þe lasse Brutayne myd þýs sorwe he com,
To þe kynges *neucu* Salomon.

Id. p. 253.

My broþer delyuer þou me, mý *neuow* þou me grante.

R. Brunne, p. 69.

And whanne thine husbond is to bed go,
While that he slepeth cut his throte atwo
For in my dreame it is warned me,
How that my *newewe* shall my bane be.

Chaucer. *The Legend of Hypermetre*, p. 318.

The king being not a litle abashed with this interpretacion, married his doughter neyther to a nobleman, nor to one of his owne country, least the nobilitie of the parentes should adaunce & encourage his *nephewe* to take much upon him.

Arthur Goldyng. *Justine*, book i. fol. 2.

The question standeth in thys whyther the olde holy doctours and sayncts whom we call y^e fathers, be better to be beleued in the construccion and the vnderstanding of Chryst and hys apostles and y^e olde prophets to, whom we be content y^e these men cal graundfathers & great graudfathers to or els these yong new naughty *nephewes*.

Sir Thomas More. *Workes*, fol. 538. col. 1. *The Second Part of the Coniutation of Tyndall*.

Their eldest sonnes also that succeeded them, were called Joues; and their *nephews*, or sonnes sonnes, which reigned in the third place, Hercules.

Holinshed. *The Description of Britaine*, vol. i. ch. ix. p. 38.

This people's vertue yet so fruitful was,
Of vertuous *nephewes*, that posteritie,
Striving in power their grandfathers to passe,
The lowest earth ioind to the heaven hie.

Spenser. *The Ruines of Rome*.

PHEW.

All that believe the Bible must necessarily derive from Noah; but for the rest of the world, they think little of his sons or nephews.
Locke. Of Government, sec. 141.

NEPH-
TYS.

The uncle is certainly nearer of kin to the common stock by one degree than the nephew; though the nephew, by representing his father, has in him the right of primogeniture.

Blackstone. Commentaries, book ii. ch. xiv.

NEPHILA, in Zoology, a genus of *Arachnoida*.

Generic character. *Maxillæ* elongate, narrower at their base, their apex truncate; *labium* elongate, its base rather narrower, the apex abruptly subacuminate; *thorax* elongate-quadrate, anteriorly abruptly narrower, notched behind; eyes eight, the four middle ones placed on a gradually-formed elevation; the two anterior ones rather largest, lateral eyes on each side two, subgeminated, placed rather obliquely in a tubercle; *abdomen* very elongate, scarcely thicker than the thorax; legs elongate, slender, rather hairy, the first pair thin, the second pair longest, the third pair the stoutest; claws exerted.

Type of the genus, *Aranea maculata*, Fabricius; Leach, *Zool. Misc.* vol. ii. pl. 110. Inhabits China.

NEPHRITIC, } Fr. *nephritique*; It. *nefritico*;
NEPHRITICAL, } Sp. *nephritico*; Lat. *nephriticus*;
Gr. νεφρίτικος, from νεφρίτις, a disease in the reins,
(νεφροί.)

Mr. Harrison hath been of late somewhat more than heretofore troubled with certain nephritical fits; but they are transient and light, *Et jam mansueta mala.*

Reliquiæ Wottonianæ, p. 481.

The balsam of Peru, obtained by boiling wood and scumming the decoction, [is] a very valuable medicine, and of great account in divers cases, particularly asthmas, nephritic pains, nervous colics, and obstructions.

Berkley. Works, vol. ii. p. 496. Siris, sec. 62.

NEPHROPS, in Zoology, a genus of *Macrurous Crustacea*.

Generic character. *Antennæ* four, inserted in the same horizontal line, external with the basal joint of their peduncle furnished at its apex with a scale, which is produced beyond the apex of the peduncle; eyes reniform, abruptly shorter than the peduncles; *abdomen* with the external lamella of the tail bipartite; legs for walking ten, anterior pair largest, angular, spinous, and didactyle; the coxæ of the fifth pair of the male, and of the third pair of the female, perforated.

Type of the genus, *Cancer porregius*, Linnæus; Pennant, *British Zoology*, vol. iv. pl. xiii. fig. 1. Inhabits the Norwegian and British Seas.

NEPHROTOMA, in Zoology, a genus of *Dipterous* insects.

Generic character. *Antennæ* porrect; of the male nineteen-jointed, the first and third cylindric, the second cup-shaped, the remainder excised, somewhat reniform; of the female fifteen-jointed, the first and third cylindric, the second cup-shaped, the remainder subcylindric, thickened at the base; *palpi* exerted, incurved, four-jointed; the terminal joint elongate; *ocelli* wanting; wings two, lanceolate, divaricating; legs long and slender.

Type of the genus, *N. dorsalis*, Fabricius; Meigen, *Dipt.* vol. i. p. 202. pl. v. fig. 19—22. One species only, a native of Europe; found in Britain but rarely.

NEPHTYS, in Zoology, a genus of *Antennated Annelides*.

Generic character. *Proboscis* narrowed at its base, composed of two segments; the lower one long, claviform, and rough at its apex, with small pointed tenta-

cula; the upper very short, open longitudinally, and the orifice furnished with two rows of tentacula; jaws two, small, horny, bent, and pointed; *antennæ* small, two-jointed; eyes indistinct.

Type of the genus, *N. Hombergii*, Savigny; Lamarck, vol. v. p. 314. Inhabits the coasts of France.

NEPOTISM, Fr. *nepotisme*, from the Lat. *nepos*. Applied in Addison as in French, to the corrupt promotion of nephews by the reigning Pope.

Yet it is to this humour of *nepotism* that Rome owes its present splendour and magnificence, for it would have been impossible to have furnished out so many glorious palaces with such a profusion of pictures, statues, and the like ornaments, had not the riches of the people at several times fallen into the hands of many different families, and particular persons.

Addison. Italy, p. 114.

NEPTUNIA, in Botany, a genus of the class *Polygamia*, order *Monoecia*. *Generic character*: about thirty hermaphroditic flowers at the top of the spike; calyx five-cleft; corolla none; stamens ten; style one, the lower flowers with a corolla of ten petals; the stamens and style wanting.

One species, *N. oleracea*, native of Cochin China: Loureiro.

NERITA, in Zoology, a genus of *Gasteropodous Mollusca*.

Generic character. Shell solid, semiglobular, flattened below, not umbilicated, furnished with an operculum; aperture entire, semicircular; inner lip flattened, margined, often dentated; the teeth or crenulations on the inner face of the outer lip.

Type of the genus, *N. littoralis*, Linnæus; Lister, *Anim. Angl.* p. 164. pl. iii. fig. 11—15.

The *Neritæ* are all marine shells, and some of them are very prettily coloured; there are many species, only three of which inhabit the shores of Britain. The type is the common Periwinkle.

NERITINA, in Zoology, a genus of *Gasteropodous Mollusca*.

Generic character Shell thin, semiglobular or oval, flattened below, not umbilicated, furnished with an operculum; aperture semicircular, the left margin flattened; no teeth or crenulations in the internal face of the outer lip; *operculum* with a lateral point.

Type of the genus, *N. fluviatilis*, Linnæus; Lister, *Anim. Angl.* p. 126. pl. ii. fig. 20.

The *Neritina* are river shells; the type is abundant in the rivers of England, especially in the Thames.

NERIUM, in Botany, a genus of the class *Pentandria*, order *Monogynia*, natural order *Apocineæ*. *Generic character*: flower contorted; calyx five-parted, small, persisting; corolla funnel-shaped, a crown of five scales at the throat; superior extremity of the seeds comose.

Eight species, natives of the East Indies and Arabia. Several of the species have been long cultivated in gardens by the name of *Oleander*; they are elegant in their foliage, and the double varieties have fine flowers; those of *N. odorum* are highly fragrant.

NERTERIA, in Botany, a genus of the class *Tetrandria*, order *Digynia*. *Generic character*: calyx none, corolla funnel-shaped, four-cleft, superior; berry two-celled, two-seeded.

One species, *N. depressa*, native of Chili.

NERTHOPS, in Zoology, a genus of *Coleopterous* insects.

Generic character. *Antennæ* straight, very short,

NEPH-
TYS.NER-
THOPS.

NER-
THOPS.
—
NESÆA.

incrassated, inserted in the middle of the rostrum; the funiculus composed of transverse coarctate joints, gradually increasing in thickness; the club ovate, acuminate; head produced anteriorly into a shortish, nutant rostrum, which is rounded and slightly bent; eyes lateral, very large, nearly united beneath the head: *elytra* oblong-quadrate, slightly convex; shorter than the abdomen, the apex of which is exposed and semicircular.

Type of the genus *Rhynchites multiguttatus* of Wiedemann.

NERVE, *v.* } Fr. *nerf*; It. *nervo*; Sp. *nervio*;
NERVE, *n.* } Lat. *nervus*; Gr. *νεῦρον*, a string,
NE'ERVELESS, } that which stringeth or strength-
NE'RVIOUS, } eneth.
NE'RVIOUSLY, } To nerve; to strengthen, to in-
NE'RVIOUSNESS, } vigorate; to empower; to give
NE'RVY. } strength or vigour, might, force, or
power. *Nerve* is used as equivalent to *sinew*.

Nervous, or *nervy*; well strung, strong, vigorous, powerful;—also sensitive in the *nerves*; *sc.* to excess, and, consequently, weak, debilitated, diseased in them.

His shelde to dashed with swords and with maces,
In which men might many an arowe find,
That thirled had both horn, *nerfe*, and rind.

Chaucer. *Troilus and Creseide*, book ii. p. 242.

But to nobler sights
Michael from Adam's eyes the filme remov'd
Which that false fruit that promis'd clearer sight
Had bred; then purg'd with euphrasie and rue
The visual *nerve*, for he had much to see.

Milton. *Paradise Lost*, book xi. l. 415.

He led me on to mightiest deeds
Above the *nerve* of mortal arm
Against the uncircumcis'd, our enemies.

Id. *Samson Agonistes*, l. 640.

For bold Hippothous,
(Lethris, Pelasgus famous sonne) was so adventurous
That he would stand to bore the corse about the ankle bone,
Where all the *nervy* fivers meet, and ligaments in one.

Chapman. *Homer. Iliad*, book xvii. fol. 242.

Thy nimble Satyrs too, and every straine
(With *nervy* strength) that issued from thy braine,
Will lose the glory of their own cleare bayes,
If they admit of any other's praise.

Wilson. *Elegy upon Donne*.

It quite dispirits Religion, by placing it in languid, abortive vel-
leities, and so cuts the *nerves* of all endeavour, by rating glory at a
bare desire, and eternity at a wish.

South. *Sermons*, vol. iii. p. 145.

There sunk Thalia *nerveless*, cold, and dead,
Had not her sister Satire held her head.

Pope. *The Dunciad*, book iv. l. 41.

Nor hands alone the missile deaths supply,
From *nervous* cross-bow whistling arrows fly.

Rowe. *Lucan*, book iii.

His pencil [Peter Angelis] was easy, bright, and flowing, but his
colouring too faint, and *nerveless*.

Walpole. *Anecdotes of Painting*, vol. iv. ch. i. p. 16.

He [Marston] thus *nervously* describes the strength of custom.

Warton. *History of English Poetry*, vol. iv. sec. 47. p. 66.

If there had been epithets joined with the other substantives,
it would have weakened the *nervousness* of the sentence.

Id. *Essay on Pope*.

NESÆA, in *Botany*, a genus of the class *Dodecan-*
dria, order *Monogynia*, natural order *Salicariæ*. Generic
character: calyx hemispherical, four or five lobed;
petals four to six lobed, alternately erect; capsule covered
by the calyx; four-celled, seeds minute.

One species, *N. triflora*, native of the Island of
Mauritius.

NESCIENCE, from Lat. *nesciens*, present parti-
ciple of *nescire*, not to know, to be ignorant.

Ignorance; want of knowledge or *science*.

But many of the most accomplisht wits of all Ages, whose mo-
desty would not allow them to boast of more then they were owners
of, have resolv'd their knowledge into Socrates his summe total, and
after all their pains in quest of science, have sat down in a profest
nescience.

Glanvil. *The Vanity of Dogmatizing*, ch. ii. p. 15.

But God fetcht it about for me, in that absence and *nescience* of
mine.

Hall. *Works*, vol. iii. fol. 15. *Specialities of his Life*.

NETHERLANDS.

Nature and aspect of the Country.

greatest amount of capital ever accumulated on the same extent of territory, seems ill suited by nature for such advantages, as the greater part of it consisted originally either of morasses deposited by the Rhine and other rivers, shoals recovered from the sea, and still in danger of inundation, or of sandy and sterile heaths. The North-Western part, to about a third of the extent of the Dutch Provinces, is lower than high-water mark, and the waves are excluded either by downs or sand-hills, which, at an average height of sixty feet, extend along the coast; or where these are interrupted, artificial mounds, constructed at vast expense, and maintained by incessant vigilance and labour, prevent those fertile tracts from again becoming an expanse of ocean. Labourers are incessantly employed in repairing breaches, in planting the banks with rushes or other aquatic plants to assist in breaking the force of the waves, or in spreading sail-cloth on spots which they perceive yielding to the action of the surf; and so expensive are these works that £200,000 sterling have in the course of fifty years been expended on the dams, extending for about eighty miles along the Western coast of the Zuyder Zee.

Irruptions of the sea.

But the History of the Country gives many melancholy instances how imperfect a safeguard is all human contrivance against the mighty operations of Nature. Most of the extensive inlets have been formed by encroachments of the sea. The Zuyder Zee originated in 1225, by an irruption of the German Ocean, which permanently covered 1200 square miles, the present area. The Dollart, to the North of Groningen, was formed by a similar catastrophe in 1277, when fifty towns were overwhelmed. The Biesbosch, an extensive estuary of the Waal, had its origin from an inundation in 1421, when seventy-two villages and 100,000 persons were swept away. The Sea of Haarlem, twenty-five square miles in extent, was produced by an inundation which occurred in the XVIth Century. The grounds lying lower than the sea are called *Polders*, and as, through the interminable extent of the dams seaward and inland, water makes its way by infiltration or breaches, hydraulic machines, set in motion by cattle or windmills, draw it off every Spring, to allow the agriculturist to commence his labours. The soil in those Polders, which form the territory of Groningen, Friesland, Holland, Zealand, and West Flanders, is deep, rich, and very productive. The Eastern part has generally a sandy soil, the continuation of the vein of that nature extending through the North of Germany, but the industry and skill of the Netherlands have covered it with excellent crops. The extensive morasses of Peel and Bourtang are irreclaimably sterile, yet the peat which they yield, to the amount of 12,000,000 tons annually, renders them of great and indispensable utility in a Country nearly devoid of forests and coal. The soil in the Southern Provinces is a fertile clay, and the surface, as we proceed in that direction, becomes gradually more elevated, rising into the mountains of Luxemburg, a prolongation of the Ardennes of France, and in some places attaining a height of 2000 feet. These mountains contain rich beds of iron and lead ore, and their surfaces, which in general have a highly picturesque form, are covered with forests. The Southern Provinces in general are well wooded, and the timber, disposed in groves or forests of moderate extent, adds much to the beauty of the scenery.

Rivers. Rhine.

The Rhine attains its greatest magnitude in that part of its course at which it enters the Netherlands. In

this place, half a mile broad, it separates into two channels, the more Northern of which retains the original name, the Southern assumes that of Waal, the *Wahalis* of the Romans. The channel retaining the name of Rhine, sends off a considerable body of water by the Yssel, (originally a canal constructed by order of Drusus,) which discharges it into the Zuyder Zee at Campen. Soon after the divergence of the Yssel it is divided into numerous channels, of which the principal, named the Leck, joins the Maes, after which the united streams are called Merwe. The Waal, the Southern and more considerable stream into which the Rhine is divided, falls into the Maes, near Gorcum. The Maes passes from France into this Kingdom, through which it flows for a distance of about 120 miles, and after enclosing a numerous archipelago by its branches, at Brill falls into the sea with so full and strong a stream as to produce for some distance a perceptible freshness in the sea water. The Scheldt, rising in France, holds its course Northward through the Belgian territory, a distance of 140 miles. Some miles above Antwerp it becomes a deep and wide stream, and at that town is 1600 feet broad, and navigable for vessels of the greatest draught of water. Of the lesser rivers, the most considerable are, the Lys, the Dender, the Neethe, the Dyle, tributaries to the Scheldt; the Roer, and the Sambre, to the Maes. No Country possesses in so high a degree the advantages of inland navigation; the surface of the Western Provinces is a network of canals communicating with each other and with the numerous navigable rivers. A well-paved road along the banks of the canals affords footing to the men or horses employed in drawing the passage-boats, the usual mode of conveyance in those parts, and the most agreeable to the phlegmatic temperament of a Netherlander.

NETHERLANDS.

Maes.

Scheldt.

Climate.

The air is in general hazy, and loaded with moisture, in consequence of which metals quickly rust and wood rots, so that it requires the unwearied care and neatness of the Dutch to remedy this inconvenience. In the months of November and December, thick fogs frequently set in, and have an unfavourable influence on the health of the inhabitants, producing scorbutic complaints and intermittents, especially deleterious to the health of foreigners. The weather in Spring is generally rainy, cold, and windy; in Summer variable, so that in the course of a day it will change from sultry to raw, or even severe cold. September is the pleasantest month, as the temperature then is mild, the air unusually clear, and the weather dry and steady. The Winters are often so severe that the rivers and inlets of the sea are frozen so as to prevent navigation. Then all classes, women as well as men, crowd on the ice, skimming over it on skates, or amusing themselves with carriages set on sharp edges of iron, and bearing sails, which frequently propel them with the velocity of thirty miles an hour. In the South-Eastern tract bordering on France, the climate is drier, warmer, and more salubrious than in the other parts.

The population amounts to 5,230,000 persons, or 218 on an average to every square British mile. It is very unequally distributed, as in East Flanders there are 583, in Holland 361, in Dreuthe but 60 to a square mile. Of these, 2,016,157 belong to the Northern Provinces, formerly the territory of the Dutch Republic, 3,213,843 to the Southern or Belgian Provinces, which last division is much the more densely peopled, in consequence of possessing a soil of greater fertility and less

Population.

NETHER-
LANDS.Character
of the
People.Rural in-
dustry.

overspread with water. Of this population, 1,500,000 are Protestants of various denominations, 85,000 Jews, the remainder Roman Catholics, in general the inhabitants of the Belgic or Southern Provinces. The Belgians are a mixture of the primitive Teutonic race with the Celts, and speak a dialect of Dutch, approaching continually nearer to a *patois* of French, according to the Southern position of the population. The inhabitants of the Northern Provinces are either Dutch or Frieslanders, who speak the Frisic dialect of the Teutonic, becoming every day more circumscribed and obsolete. The people in general are a robust, laborious, and hardy race, characterised by a phlegmatic temperament, more apparent in the Dutch than in the Belgians. They rarely, and with difficulty, are roused to any violent demonstration of passion, but when some powerful agent has produced such an excitement, it is prolonged, furious, and unmanageable. Their industry is unexampled and concentrated with unwearied perseverance on a single object, so that an artist has been known to devote twenty years of unintermitted labour to one work. Though cautious, reserved, and even mistrustful, the Netherlander is usually exempt from duplicity, correct and honest in meeting his engagements, sincere and steady in friendship, rarely relinquishing habits which he has once formed unless compelled by irresistible necessity, almost superstitiously attached to neatness and frugality, and cherishing a love of accumulation as his master passion. The moisture of the climate inclines him to the use of ardent spirits and malt drinks, but the consumption of these has latterly been much circumscribed by the increased use of tea and coffee. From the same Physical cause the smoking of tobacco is universal. Strong lines of discrimination may be observed between the characters of the Belgians and the Dutch. The Belgians are bigoted in their Religious belief, the Dutch moderate and rational; the Belgian in many instances affects the opinions and manners of the French, and is not averse to a union with them; the Dutch are inclined to seek friendship and intercourse with the Germans, viewing the French with a dread and jealousy resulting from past injuries and a total dissimilarity of character.

Throughout the Dutch Provinces, the attention of the landholder, who is also usually the proprietor, is principally directed to the management of live stock; and the ground being with this view employed as meadow land or pasture, does not afford corn sufficient for the consumption of the inhabitants, so that above one half of the demand is supplied by grain transported from the Belgian Provinces or Germany. Horned cattle are by far the most important denomination of live stock, and no where is their management more skilful or successful. The milch cows, supplied with luxuriant pasture, carefully housed in Winter, and curried and dressed with as much assiduity as horses in England, supply on a yearly average 100 pounds of butter, and double that quantity of cheese. The dairy is managed with admirable neatness and skill; its products in consequence have such excellence that they find high prices and ready sale. Cheese is considered the main article, and above 30,000,000 pounds are annually prepared. The horses are slow, strong, of great size, and of heavy but regular proportions, much valued for draught, and as chargers for heavy cavalry: the largest kinds are found in the Belgian Provinces; and attain a size, especially in the vicinity of Furnes, which would in most Countries be regarded as preternatural. Sheep do not receive much of the far-

mer's attention in the Northern Provinces, but in the South-Eastern tracts they are more numerous, yield valuable wool, and have a remarkably savoury flesh. Swine are fed in great numbers, and grow to an unusual size, but the flesh is soft, and overloaded with lard. Geese are reared in vast flocks in the fens and lakes, and their quills and feathers form a considerable article of commerce. In 1803, the live stock of the Dutch Provinces was found by enumeration to amount to, horned cattle 993,000; horses 270,000; sheep 600,000; swine 480,000. The shallow intricate sea which washes the shores of the Netherlands, abounds in excellent fish, and the annual average value of those taken is £800,000. Of sea-fish, the principal are herrings, cod, and turbot. The rivers abound in salmon. The more remote fisheries, formerly carried on to a great extent by the Dutch, were almost totally destroyed during the long course of hostilities carried on by the English cruisers against the Dutch marine. They are now, however, reviving; 200 large vessels used formerly to be despatched every year to the whale-fishery, the number has now fallen to 50, and the expense is scarcely repaid by the proceeds.

Coal is the most important of mineral products, and above 2,000,000 tons are annually raised in Hennegau, Limburg, and Luttich. The iron mines situated in the same districts yield annually 17,000 tons of that metal.

The period has passed away when the manufactures of the Southern and the commerce of the Northern Provinces were the most active and lucrative in Europe; still the habits and stock acquired in a long course of prosperity have caused many branches to be successfully pursued under circumstances of external discouragement which must have proved ruinous to capitalists less opulent, skilful, and persevering. The names *hollands*, *cambrics*, and *diapers* indicate the acknowledged excellence of the flaxen goods produced in the Low Countries. The principal manufactories are in East and West Flanders, Brabant, Antwerp, Haarlem, and Hennegau. Bruges, Courtray, and Ypres are celebrated for the superior quality of their damasks and table linen. In the market of Courtray above 30,000 pieces of fine linen are annually sold, and regarded in commerce as inferior to none in the world; the price of a considerable proportion running from ten to twenty shillings a yard. Brussels holds the first place in the manufacture of lace, the thread for which is procured from Haarlem, where it is produced of such fineness as to bring thirty pounds sterling for the pound avoirdupois. Mechlin also is noted for the production of that costly luxury. The woollen manufacture has greatly decayed since the XVth and XVIth Centuries, when this branch of industry employed at Louvaine above sixty thousand, at Bruges fifty thousand, at Ghent eighty thousand workmen. The oppression and short-sighted cupidity of the Spaniards caused the emigration of many artisans who transferred the manufacture to England. Still Limburg and some of the adjacent towns produce broad-cloth no where to be excelled. Leyden is at present the principal seat of the woollen manufacture, where ten thousand pieces of cloth and fifteen thousand of lighter woollens are annually made. The cotton manufacture is most flourishing at Ghent, where it employs twenty thousand persons; above five thousand are engaged in it at Brussels. The silk manufacture is most flourishing at Antwerp, the leather at Maestricht; Leyden and Alcemaar produce most of the Dutch parchment so highly prized. The Dutch

Fisheries.

Mineral
products.Manufacturing in-
dustry.

NETHERLANDS. paper, formerly superior to any other, is now rivalled by the mills of England, France, and Italy. North Holland at present produces it in the greatest excellence and quantity. The importation of tobacco at Amsterdam is enormous, and its preparation for sale in various forms employs twenty-four thousand persons. The quantity of ardent spirits distilled in the Northern Provinces is estimated at fourteen million gallons: nine millions and a half are exported. The earthenwares are for the most part tiles and fire-bricks; the numerous potteries of Delft have dwindled to six. Gonda is still noted for producing the best tobacco-pipes, in the manufacture of which five thousand persons find employment. The iron-works of the Southern Provinces are considerable, those of Luttich produce goods to the amount of £115,000 annually. The following numbers, stated by Cannabich, show the variations of the trade of this Country in consequence of the Revolutionary war. In 1790 the number of its ships which passed the Sound were 2009, in 1796 but 1, in 1814 the number rose to 551. In 1794 the number of ships entered inwards amounted to 4290, in 1808 to 63, in 1815 to 1609. The Dutch are the principal carriers of British goods sent to Swisserland and the South-Western part of Germany. This advantage presented to them by their position, and their command of the lower parts of the Rhine, is improved with great diligence. It is computed that fifteen thousand craft of various sizes are employed in the inland navigation of the Northern Provinces. Most of the timber used in Holland is conveyed down the Rhine in large floats, which are broken up at Dortrecht, and their materials sold by auction. The chief exports are cheese, butter, salt fish and flesh, tobacco, ardent spirits, linen, yarn, woollens, lace, leather, and earthenware. The chief imports are corn, salt, wine, timber, and tropical productions, principally drawn from the East Indian colonies. The Bank of Amsterdam has a capital of £500,000 in 5000 equal shares. Accounts are kept in guilders, stivers, and pence. 11 guilders and 8 stivers are equal to a pound sterling. The gilder contains 20 stivers and the stiver 16 pence. The principal coins in gold, are the ryder containing 14 guilders, the single ducat containing 10 guilders 5 stivers, and double ducat; in silver, the ducatoon containing 3 guilders 3 stivers, the dollar 2½ guilders, the schelling 6 stivers, the stiver and half-stiver piece. In copper, the duit containing 2 pence, and the penny. The Dutch mile contains 6412 English yards, or 3⅔ English miles nearly. The ell, the most usual measure of length, contains 28 English inches. The ahm, the most used of liquid measures, contains 4 ankers, and is equal to 40½ English wine gallons. Grain is measured by the last, containing 83 Winchester bushels. Of the weights, the centner contains 100 pounds. Of superficial measures, the morgen, or Dutch acre, is equal to 2 acres and a perch English.

Trade.

Coins, weights, and measures.

Literature.

In surveying the records of their National Literature, the Netherlanders have reason to be proud of the extensive erudition, the sagacity, and the wit of Erasmus, the learning, the judgment, the enlightened piety of Grotius. The extensive intercourse which the Dutch long maintained with foreign Nations, combined with their thoughtful temperament, has made the principles of natural and international Law a favourite subject for the investigation of their writers. The principles and reasonings set forth by Grotius, Bynkershoek, and Wiquefort, are received as authority in the Courts of justice throughout the civilized World. In Classical Literature it will

be sufficient to enumerate the well-known names Grævius, Heinsius, Lipsius, Meursius, the Burmanns, Drakenborch, Hemsterhuis. In the vernacular tongue the most eminent writers are the copious and prolific Vondel, Jacob Cats, and Bilderdyck, at present living. The natives of this Country hold a distinguished station as contributors to the Fine Arts. The style and finishing of their wood-cuts, letter-press, and engravings during the XVIIth and part of the XVIIIth Centuries, were probably superior to those of any other Country. The Dutch School of Painting, commencing with the XVIth Century, and enumerating among its members Huysum, Wouvermann, and Rembrandt, is characterised by truth of expression and marvellous minuteness and accuracy of finishing. The productions of the Flemish School are distinguished by brilliancy of colouring, greatness of design, and powerful yet natural expression. Among a long list of well-known names, this School can boast of those of Van Dyck, of Teniers the elder and the younger, and of Rubens.

Fine Arts.

Literary institutions.

There are at present six Universities in the Netherlands: Leyden having 304 students, Utrecht 198, Groningen 200, Luttich (Liege) 301, Löwen (Louvaine) 262, Ghent 198. Of Associations for intellectual improvement, the principal are the Royal Institute of Science and the Fine Arts at Amsterdam, and the Royal Academy of Science and the Fine Arts at Brussels. The Public Library at Antwerp is considerable; still more so that of Ghent; at Brussels the collection amounts to 80,000 volumes. The Hague is adorned by the Royal Library and a noble Collection of medals and pictures.

The Civil Constitution of the Netherlands is established on the basis of an Instrument set forth in 1815. The executive power is vested exclusively in the King, whose character is irresponsible, his person inviolable, his right hereditary. The Civil List is £260,000 annually; the dower of the Queen Dowager £15,000. The legislative functions are discharged by the King and two Houses, the Upper consisting of Members appointed by the Crown for life, and whose number must not fall below forty, nor exceed sixty: they are not eligible until forty years of age. The Lower House consists of 110 Members, chosen by the Provincial Assemblies, themselves formed in each Province by popular election. The Members of the Lower House are not eligible under thirty years of age. The King can propose laws to the States-General, (as both Houses are by a common title denominated,) who can in turn, if any measure be supported by a majority in both Houses, propose it for the Royal sanction. Grants of money can originate only in the Lower House. The King's title is King of the Netherlands, Grand Duke of Luxemburg, Prince of Orange-Nassau. The heir-apparent is styled Prince of Orange.

Political organization.

The yearly revenue of the State is very great in proportion to its extent and population, as it amounts to above seven millions. This income seldom completely covers the expenditure, of which £2,600,000 are allocated to pay the interest of a debt of fifty-seven millions sterling.

Finances.

The standing army consists of 60,000 men, of whom a large proportion are in garrison. The numerous and strong fortresses which guarded the frontier towards France, and were demolished by order of Joseph II., have been replaced by a line of fortified posts, established since the general pacification of 1815, and extending from Ostend to Luxemburg. The naval force, once so

Armed force.

NETHERLANDS. formidable, has sunk to sixteen ships of the line and thirty frigates; the principal naval stations are the Helder, Antwerp, Flushing, and Helvoetsluys.

Ecclesiastical institutions. The Constitution of the Netherlands professes toleration for all forms of Faith. The Reformed Church of Holland reckons among its members the Royal Family and most of the inhabitants of the Northern Provinces. The Church government is conducted by a general Synod, subordinate to which are the Synods of each Province. There are 1448 clergymen having cure of souls. Of the other denominations of Protestants the most numerous are the Menonites, of which there are 194 congregations. The Remonstrants, or followers of Arminius, have 34 congregations, the Lutherans 41. The Roman Catholic Church, to which nearly all the inhabitants of the Southern Provinces conform, besides a considerable number in the Northern, is governed by the Archbishop of Mechlin, and the Bishops of Namur, Doornik, (Tournay,) Luttich, (Liege,) Ghent, and some inferior dignitaries.

Provinces. The Kingdom of the Netherlands is divided into the following Provinces.

	Contents in British miles.	Population.	Chief Towns.	Population.
Holland.....	2058	747,600	Amsterdam ...	230,000
Friesland.....	1134	176,500	Liewerden	17,000

Namur	1050	156,375	Namur	16,165
Luttich (Liege)	2142	354,000	Luttich (Liege) .	47,000
Limburg	1470	292,187	Mastricht	18,410
Luxemburg ...	2268	255,000	Luxemburg	9,432

For AMSTERDAM, ANTWERP, ARNHEM, BRUGES, BRUSSELS, BOIS LE DUC, FLANDERS, GHENT, GRONINGEN, LIEGE, LUXEMBURG, see those names in the alphabetical order.

Assen. The size and population of *Assen* are proportioned to the small and thinly peopled Province of Drenthe, of which it is the Capital. It is pleasantly situated in a wood, and inhabited for the most part by persons in easy circumstances, whose houses, well built and kept in very neat order, give to the town an air of great regularity and comfort.

Flushing. *Flushing*, celebrated for its disastrous occupation by the vast armament of England in 1809, contains extensive docks and magazines, and can afford accommodation to eighty ships of the line. It is strongly fortified, and the approaches can be laid under water, but its chief protection is a climate in the highest degree deleterious to the constitutions of foreigners.

Liewerden. *Liewerden* is a handsome town, surrounded by a ditch and an earthen rampart. Its streets have canals extending through them, so that the *trottoirs* are little else than paths along the sides of those channels. Its principal buildings are the Council-House of the States of the Province, the Town-house, and the Palace, where the Princes of Orange, the hereditary Stadtholders of the Province, used to reside. In the great Church are the

tombs of many of the members of that illustrious **NETHERLANDS.** family. There are besides eleven Churches. It enjoys the advantages of communication by water with Franeker, Harlingen, and Dockum, and is altogether a thriving and busy town.

Mastricht. *Mastricht* is a strongly fortified place, defended not only by ramparts, but by a fortress, which, built on the hill called Petersburg, commands the town. There is a handsome bridge, 500 feet long, over the river Maas. The town is in general well built; among its parts the most remarkable is the Market-place, adorned with a handsome Council-House, containing a public Library. The Maas, navigable for craft of considerable burthen, is the channel of an active commerce. There are nine Churches, nearly equally divided between Roman Catholics and Protestants, and twenty-one Convents. The hill Petersburg is undermined by an immense quarry, wrought at a period anterior to record. The immense labyrinth formed by these works is twenty miles in circuit, and contains above twenty thousand passages, which cannot be visited with safety unless in company of a guide. Numerous funnels afford light and air to those employed below. It served as a place of refuge for the inhabitants during the sieges which this important place has often endured. The blocks of a soft and friable limestone are conveyed in carts along tunnels, which discharge them on the banks of the Maas. Several Museums in the town contain a great number of fossil exuviae extracted from this quarry; among them are portions of two skeletons of crocodiles, above twenty feet in length.

Middleburg. *Middleburg*, in the Isle of Walcheren, is a thriving and wealthy town, communicating by a canal and by an excellent road with Flushing. It is recorded as the place at which optic glasses were invented. There are twelve Churches and a Jewish Synagogue.

Mons. *Mons*, which derives its principal resources from extensive beds of coal in its vicinity, is well built, large, wealthy, and strongly fortified, but presents no circumstance worthy of peculiar notice.

Namur. *Namur* is situated on the confluence of the Maas and Sambre, in a beautiful valley formed by bold hills, whose summits are crowned by luxuriant timber. It is a handsome and thriving town, having a Cathedral and sixteen other Churches. There is a bridge over the Sambre, and another over the Maas, here 400 feet wide. It is celebrated for its sieges: in 1692, when Louis XIV. invested it with a great army, and made himself master of it after a brief defence; and in 1695, when William III. retook it in the presence of a French force little inferior to his own.

Utrecht. *Utrecht*, situated on the Rhine, is built in an antique but commodious and impressive style of architecture. The approach to the town is by noble avenues and walks, of which the principal is the Mall, having four parallel alleys planted with rows of trees, and in the midst is a foundery for cannon-shot, extending the length of 1150 yards. The Cathedral is a large building, with a lofty tower commanding an extensive prospect over the surrounding country. Here, in 1579, the union between the Seven United Provinces was concluded, and in 1713 the Treaty of Peace between England, France, and Holland was signed. The University, founded in 1636, is conducted by nineteen Professors, and has a good Library, an Observatory, and an admirable Anatomical Museum.

Zwolle. *Zwolle* is a strongly-fortified and well-built town, Zwolle.

NETHERLANDS. traversed by two canals, which afford communication with the Yssel, distant two miles. The hill of St. Agnes, which overhangs it, has beautiful gardens and walks, which render it a great ornament to the town.

Colonies. The Colonies of this State are, after those of England, the most valuable possessed by any European Power. The King has the prerogative of managing the Colonies and of appointing their Governors. The local Government of the Asiatic Colonies is vested in a Governor-General, resident at Batavia in the Island of Java. They are subdivided into ten jurisdictions. 1. That of Java, including three-fourths of the extent and population of the Island, while the Chiefs not strictly regarded as subjects, are placed under such commercial and political restrictions, that their independence is in fact but nominal. This jurisdiction includes the Island of Madura and some others of smaller extent. 2. Amboyna, containing that Island and a few adjacent of inferior importance. 3. Banda, consisting of the ten isles of the group of that name. 4. Ternate, which includes also Motir and a few other small Islands. 5. Timor and some adjacent isles. 6. Macassar, on the Island of Celebes. 7. Malacca, consisting of some territories of no great importance on the Peninsula of that name, and some factories on the Island of Borneo. 8. The factories on the Island of Sumatra, of which Palembang is the chief. 9. Pulicate, Cochin, and a few other factories on the coast of Hindústan. 10. The Japanese factories at Nangasaki. In Africa the King of the Netherlands possesses thirteen forts on the coast of Upper Guinea. The American Colonies are Surinam, on the Continent, peopled by 52,000 black slaves and 5100 free persons either white or of colour; of the Islands, St. Eustatius, Curaçao, Saba, and St. Martin. The Colonies contain collectively about 109,000 square British miles and five million inhabitants. The gross revenue is about £1,250,000, but of this not a tenth is remitted to the Royal Exchequer in Europe.

History. The great Delta of the Rhine, constituting a large and important portion of the territory of the Netherlands, was early the seat of an active and warlike race, which like its neighbours submitted to the Roman yoke, and afterwards formed part of the Empire of Charlemagne. On the dissolution of the Carolingian Empire, two principal and contemporary dynasties, those of the Counts of Holland and Counts of Flanders, are preeminent amidst the multitude of insignificant rulers. Gurulf is the first Count of Holland about whom History can pronounce with any certainty. He received investiture from Louis the Debonaire in 839. The last ruler of that family was the Countess Jacqueline, despoiled of her dominions in 1432 by Philip III. Count of Flanders. This Prince was also Duke of Burgundy, to which fief Flanders had been united in 1369 by the marriage between Margaret, heiress of Flanders, and Philip the Hardy, Duke of Burgundy, brother of Charles VI. King of France. On the marriage of Mary of Burgundy, daughter of Charles the Bold, in 1477, to the Archduke Maximilian, her rich heritage passed to the House of Austria. Philip, the offspring of this union, espoused in 1496 Joanna, heiress of the Kingdoms

of Aragon, Castille, and Leon, and their son Charles V., inheriting not only the Low Countries and Burgundy, but the dominions of the Spanish Crown and the Germanic and Italian possessions of the House of Austria, ruled an Empire relatively the most powerful possessed in hereditary right by any European Prince since the reign of Charlemagne. Charles V., in 1555, resigned the Low Countries to his son Philip II., King of Spain, whose tyranny occasioned a general revolt both of the Reformed and Roman Catholics, which threatened an immediate separation of the Low Countries from Spain. The vast power and martial character of the Spaniards, however, rendered the contest too unequal, and the ten Southern Provinces, which were less defensible by nature, and drew fewer resources from the sea, were subdued.

The Seven Northern Provinces, in 1578, formed at Utrecht a Federative League, the basis of their political Constitution. William Prince of Orange was chosen first Stadtholder, and, previously to his assassination in 1584, gave consistency and strength to the liberties of the Dutch Republic. It was not, however, till 1648 that the Republic was definitively acknowledged by Spain.

After the death of William III. no Stadtholder was appointed until 1747, when the intrigues of the partisans of the House of Orange and the armed interference of England and Austria caused the office to be declared hereditary in the descendants of William IV. Prince of Orange. In 1792 the Netherlands were invaded by the armies of the French Republic, and after a well-contested struggle, were incorporated with France in 1795. In the same year Holland, under the name of the Batavian Republic, became a dependence of France, and the Stadtholder took refuge in England. In 1806 Holland was erected into a Kingdom by Napoleon, and bestowed upon his brother Louis, on whose abdication, in 1810, the Country was incorporated into the French Empire. By the pacification of 1814 it was reunited to the Austrian Netherlands, and the Prince of Orange, William I., was declared King of the Netherlands. The contagion of that Revolutionary spirit which in 1830 destroyed in France the hereditary dynasty of the Bourbons, caused an insurrection among the Belgians averse to the paramount dominion of the Dutch. Whether they shall be again united to Holland, or allowed to exist as an independent State under the government of Prince Leopold of Saxe Coburg, whom they have chosen as their King, is a question which at the moment of concluding this notice (1832) appears to threaten the interruption of the general peace of Europe.

NE'TTLE, n. } of the same origin as *needle*, and
NE'TTLER. } meaning that which pricketh, that which stingeth.
NEUCHA-
TEL. } To *nettle*, met. to sting, to inflame, to irritate, to vex,
to provoke.

The trivial name of the *Urtica* of Linnæus.

Prine pride in pes is *nettille* in herbere
þe rose is myghtles, þer *nettille* spredis ouer fer.

R. Brunne, p. 280.

And though I might, yet would I nat do so,
But canst thou plaien raket to and fro,
Nettle in, dock out, now this, now that, Pandare?

Chaucer. *Troilus and Creseide*, book iv. p. 269.

The ground that is al foregrowē with *nettels*, breers, and other
euil weedes canne bryng forth no corne til they be weded out.
Sir Thomas More. *Workes*, fol. 74. *A Treatise vppō wordes of
Scripture*.

But these are the *nettlers*, these are the blabbing books that tell,
though not half your fellows feats.

Milton. *Works*, vol. i. fol. 79. *Animadversions upon the Remon-
strants' Defence*, &c.

Com. Morson, who's angry now? go, frantic swain,
Go, gather squills to calm your ruffled brain.

Lac. Morson, I've *nettled* somebody full sore.

Fawkes. *Theocritus. Idyl. 5*.

NEUCHATEL, *Principality of*, is a dependency of
Prussia, and at the same time a member of the Helve-
tian Confederacy, of which it is the only constituent
State having a monarchical constitution. It is bounded
on the West and North by France, East and South by
the Cantons of Berne, Fribourg, and Vaud, is 30 miles
long, 14 broad, and has a superficial extent of 340 square
miles. Its surface extends over the sides and summits of
the ranges of Mount Jura, of which the Points Chasserol
and Chasseron attain respectively the heights of 3614 and
3600 feet. The soil, having a calcareous base, is fertile,
and the valleys are well suited to the culture of vines,
here the principal object of the husbandman's care, so
that the corn crop is insufficient for the consumption, and
the deficiency is supplied by importation to the annual
value of £40,000 sterling. The vintage is computed
to afford 1,400,000 gallons, and an annual profit of
£20,000. Above the region of vineyards, rich pastures
feed herds of horned cattle, to the number of sixteen
thousand, which supply the excellent cheese known in
commerce by the name of the Country. The higher
parts are either wooded or consist of bleak yet produc-
tive pastures, and there no corn except oats will thrive;
the Winter lasts six months, and the snow is often
as high as the roofs of the cottages.

The Lake of Neuchatel, celebrated for the picturesque
beauty of its shores, extends along the South-Eastern
frontier of the Principality. It is 26 miles long and 6
broad, is 1400 feet above the level of the sea, and 325
deep in the spot fathomed by Saussure. Its water finds
an exit by the river Thielle, which falls into the Aar. It
abounds with excellent fish, the capture of which forms an
important branch of industry. Its size is continually
diminished by the substances which the torrents sweep
from the mountains, so that Yverdun, formerly at the
water's edge, is now distant several hundred yards.
Its inhabitants, amounting to 50,810, or 146 to the
square British mile, are Protestants, except about 2000
Roman Catholics. French is the prevailing Language,
though a *patois* containing much German is spoken by
the peasantry. The people are remarkable for their

ingenuity and industry, the principal seats of which are NEUCHA-
TEL. The cotton manufacture is thriving and profitable, above 5000 per-
sons are employed in the manufacture of lace, and 4000
in making watches, of which 130,000 are annually sold. NEUCHA-
TEL. (in German *Neuenberg*), on the shore of the Lake, is a small but handsome town, containing in a high
degree of excellence all the institutions which the pros-
perity or civilization of so small a community can require.
These public establishments have ample endowments,
derived from a bequest of three million florins made by
Pury, a native of this place, who accumulated an immense
fortune at Lisbon. The population of the town is 5100.
Latitude 49° 43' North, longitude 5° 27' East. Chaux
de Fond and Locle, the only other towns of any im-
portance, have respectively 5900 and 4300 inhabitants.

This Principality belonged to the French family Lon-
gueville, until its extinction, in 1707, on the death of
Mary of Orleans Duchess of Nemours; when the States
acknowledged the supremacy of the King of Prussia
as the representative of the House of Orange, to which
the right had passed. In his capacity of Prince of
Neuchatel that Monarch may neither alienate the Prin-
cipality nor divide nor modify the succession; but it may
easily be supposed that such abstract nicety is disre-
garded in practice, and in 1806 it was transferred to the
French Empire, of which it was declared a Depart-
ment. At the pacification of 1814 it was restored to
the King of Prussia, who draws from it an income of
£6000, and recruits for a battalion of 456 men. The
local militia amounts to 6000. It holds the twenty-
first place in the Helvetic Confederacy, and its military
contingent is rated at 1000 men.

And thanne I schal knowleche to hem, that I knewe you *never*,
departe away fro me ye that worcken wickidnesse.

Wiclif. *Matthew*, ch. vii.

And then wil I knowledge vnto them, that I *neuer* knewe them,
Depart fro me, ye woorkers of inquite.

Bible, Anno 1551.

He that cometh to me schal not hungre, he that bileueth in me
schal *neuere* thirste.

Wiclif. *John*, ch. vi.

He that commeth vnto me schall not hongre; and he that beleueth
on me shal *neuer* thirst.

Bible, Anno 1551.

NEVER.
—
NEVIS.

And moreover I say, though that ye have sworne and behight to performe your emprise, and *nevertheles* ye weive to performe thilke same emprise by iust cause, men shuld not say therefore ye were a lyer.
Chaucer. The Tale of Melibeus, p. 103.

Neuerthelater, sometyme it is sothe, that some thyng be of neces-
sitie, that is saied to come.

Id. The Testament of Loue, book iii. p. 502.

Neuerthelatter ye shall seke the Lord your God euen there, and shall fynd hym yf thou seke hym with all thyne hearte, and with all thy soule.
Bible, Anno 1551. Deuteronomium, ch. iv.

Neuer the later that thou mayest see, what the prayers and good woorkis of our monkes and friars and other ghostly people are worth, I will speak a word or two, and make an end.
Tyndall. Workes, fol. 162. The Obedience of a Christian Man.

Yet from those flames
No light, but rather darkness visible
Serv'd onely to discover sights of woe,
Regions of sorrow, doleful shades, where peace
And rest can *never* dwell, hope *never* comes
That comes to all.

Milton. Paradise Lost, book i. l. 66.

Little weight my wordes with thee can finde,
Found so erroneous, thence by just event
Found so unfortunate; *nevertheless*,
Restor'd by thee, vile as I am, to place
Of new acceptance, hopeful to regaine
Thy love, the sole contentment of my heart
Living or dying, from thee I will not hide
What thoughts in my unquiet brest are ris'n.

Id. Ib. book x. l. 970.

Hope springs eternal in the human breast;
Man *never* is, but always to be, blest.
The soul uneasy, and confin'd from home,
Rests and expatiates in a life to come.

Pope. Essay on Man, ep. 1. v. 96.

And from the prayer of want, and plaint of woe,
O *never, never* turn away thine ear!
Forlorn, in this bleak wilderness below,
Ah what were man, should Heav'n refuse to hear.

Beattie. The Minstrel, book i.

NEVIS, or NIEVIS, one of the Caribbean West Indian Islands belonging to the British Empire, consists of a mountain, the circular base of which is about twenty-four miles in circumference. This mountain of considerable elevation has a conical shape, terminating at the summit in a funnel-shaped depression containing deposits of sulphur, and hence it has been considered of volcanic origin. Its height causes it to be continually capped with clouds, and from the whiteness of these it is supposed that Columbus the discoverer gave it the name of *Nieves* or *Snows*. It is a beautiful and fertile island, the soil of which consists of a rich black mould, occasionally interspersed with stones. The upper part of the mountain, less suited for the cultivation of the sugar-cane, produces yams and other esculent vegetables. The climate is rainy and moist, as the high ground arrests the clouds drifted by the trade-wind from the Atlantic, and precipitates them in rain, which finds its way to the sea by numerous small rivulets, producing a picturesque aspect, and the fertility for which the island is remarkable. Sugar is the staple produce, in the growth of which about 5000 acres are employed, producing, according to the Parliamentary returns of 1822, 66,000 cwt. Land-crabs, the only indigenous animal worth noticing, occupy in great numbers burrows like those of rabbits. As they are a favourite dish with the planters, numbers are intercepted in their annual migration to the sea-shore. The prevailing complaints are those of the liver, tetanus, intermitting, bilious, putrid fevers, and cholera morbus. The attention of the British Legislature was quickened with respect to the

oppressed condition of the Negro population of this island, in consequence of the atrocious cruelties practised by Arthur Hodge, who in 1811 was executed for the murder of one of his slaves. It was given in evidence in the course of the investigation that sixty of the slaves of this wretch had died in consequence of the severity of his chastisements. (*Parliament. Papers, 1810, 1811. vol. xi. p. 9.*) The population, according to official documents of 1812, was as follows: white 501; free persons of colour 603; slaves 9326. All white persons capable of bearing arms are embodied into a well-disciplined militia, of which fifty serve as cavalry. There are five parishes in charge of three clergymen of the Church of England. *Charlestown*, the Capital, is fortified. It lies in latitude 17° 14' North, longitude 62° 35' West. Colquhoun gives the following statistical particulars: annual value of its products £375,000; exports, £320,000; imports, £94,000; amount of fixed and circulating capital, £1,444,000. It was first colonized by the English in 1628, and since that time was in the possession of the French for a short period in 1706, and again in 1782.

NEURACHNE, in *Botany*, a genus of the class *Triandria*, order *Digynia*, natural order *Gramineæ*. Generic character: glume two-flowered, two-valved, valves acute, hispid, flowers dissimilar, exterior neuter, two-valved; interior hermaphrodite; stigma plumose.

One species, *N. alopecuroidea*, a grass, native of New South Wales.

NEURADA, in *Botany*, a genus of the class *Decandria*, order *Decagynia*, natural order *Rosaceæ*. Generic character: calyx five-parted; corolla, petals five; capsule inferior, orbicular, ten-celled, ten-seeded, aculeate.

One species, *N. procumbens*, native of Egypt.

NEUROCARPUM, in *Botany*, a genus of the class *Diadelphia*, order *Decandria*, natural order *Leguminosæ*. Generic character: calyx tubular, persisting, five-toothed; two lanceolate bractea; standard of the corolla large, nearly round, keel obtuse; pod stipitate, compressed; base of the style mucronate.

Seven species, natives of the West Indies and North America.

NEUROLOMA, in *Botany*, a genus of the class *Tetradynamia*, order *Siliquosa*, natural order *Cruciferae*. Generic character: calyx erect, margin of the segments membranaceous; petals unguiculate; border obovate; pouch lanceolate, sessile, compressed, valves flat; cotyledons accumbent.

Three species, natives of the North of Europe. Decandolle.

NEURONIA, in *Zoology*, a genus of *Trichopterous* insects.

Generic character. *Antennæ* short, stout, obscurely serrated within; *palpi* maxillary elongate, the two last joints slender, the terminal one subaciculate; labial short, with the terminal joint ovate-fusiform, acute; head broad, with a tuft of hair on the forehead; eyes large, prominent; *thorax* stout, glabrous, shining; *abdomen* moderate, opaque, carinated down the back; wings all of similar texture, the anterior elongate, sub-elliptic, obtuse, with strong pilose nervures, and a lanceolate areolet in the disc; posterior with the nervures

GLOU. I haue a letter guessingly set downe
Which came from one that's of a *newtrall* hearte
And not from one oppos'd.

Shakspeare. *Lear*, fol. 300.

Neutrality in things good or evill, is both odious, and prejudicial; but in matters of an indifferent nature is safe and commendable.

Hall. *Works*, vol. i. fol. 129. *Holy Observations.*

There is no health; physicians say that we
At best enjoy but a *neutrality*.
And can there be worse sickness than to know,
That we are never well nor can be so.

Donne. *An Anatomy of the World.*

This is certain, that in all our undertakings God will be either our friend or our enemy. For providence never stands *neuter*.

South. *Sermons*, vol. v. p. 272.

Too many of our days, though christians in name, appear so indifferent as to any real belief of christianity, that they are rather *neuters* in regard to it; though on one side of the question there must be truth and safety, but in such a *neutrality* there can be none.

Pearce. *Sermon* 13. vol. i. p. 372.

Be large in proffers, in performance true;
Purchase but their *neutrality*, thy sword
Will, in despite of oracles, reduce
The rest of Greece.

Glover. *The Athenaid*, book ix.

Diuers yonge scolers thei founde properly witted, featly lerned, and *newfangled* minded.

Sir Thomas More. Workes, fol. 213. A Dialogue concerning Heresies, &c.

And when the tenauntes came to pay their quarter's rent
They bring some foule at Midsommer a dish of fish in Lent,
At Christmase a capon, at Michaelmase a goose:
And somewhat else at *Newyeares-tide*, for feare their lease flie loose.
Gascoigne. A Glose upon this Text, Dominus ejus opus habet.

(But King Henry) met with a point of great difficulty, and knotty to solue, able to trouble and confound the wisest king in the *newnesse* of his estate.

Bacon. King Henry VII. fol. iii.

What *news* (sweet Pool) look'st thou my lines should tell,
That like the tolling of the doleful bell,
Bidding the deaths-man to prepare the grave?
Expect from me no other *news* to have.

Drayton. Queen Margaret to the Duke of Suffolk.

Hard witts be hard to receive, but sure to keepe; painful without wearinesse, hedefull without wavering, constant without *newfanglednesse*.

Ascham. Works, fol. 209. The Schoolmaster.

He was so enamored with the *newell*,
That nought he deemed deare for the *iewell*.

Spenser. Shepherd's Calendar. May.

Yet such extenuation let me begge
As in reproofe of many tales deuised,
Which oft the ear of greatnesse needes must heare,
By smiling pick-thankes, and base *newes-mongers*.

Shakspeare. Henry IV. First Part, fol. 62.

Cease thou, bad *newes-man*; badly dost thou hide
Thy maister's shame, in harlot's bondage tide;
The rest myself too readily can spell.

Spenser. Faerie Queene, book v. can. 6.

————— Farewell happy fields
Where joy for ever dwells: Hail, horrors, hail!
Infernal world, and thou, profoundest Hell,
Receive thy *new* possessor: one who brings
A mind not to be chang'd by place or time.

Milton. Paradise Lost, book i. l. 257.

For the truth is, *newness*, especially in great matters, was a worthy entertainment for a searching mind, it was (as I may so say) an high test, fit for the relish of an Athenian reason.

South. Sermons, vol. i. p. 22.

I must confess, says he, I am amazed that the press should be only made use of in this way by *news-writers* and the zealots of parties.

Spectator, No. 124.

He [Edmund Waller] surprised the town with two or three pieces of that kind, as if a tenth Muse had been *newly* born to cherish drooping poetry.

Johnson. The Life of Waller.

To coin *new-fangled* wagers, and to lay 'em,
Laying to lose, and losing not to pay 'em.

Churchill. The Candidate.

NEWSPAPERS.

Roman
Diurna.

Frequent mention is made by Latin writers of *Diurna*. *Acta Diurna*, &c. and these have been sometimes, but we think incorrectly, translated *NEWSPAPERS*. Murphy, in rendering a passage of Tacitus, *Diurna Populi Romani per Provincias per exercitus curatiùs leguntur ut noscatur quid Thræsea non fecerit*, (*Annal. xvi. 22.*) boldly employs the word *Newspapers*; and expresses a wish that some specimens of them had been left to us. In the London reprint of Brotier's Tacitus, (1812,) a note also on this passage may be found, "*Romani ut et*

Not similar
to modern
News-
papers.

nos, habuere Diurna, Ang. Newspapers." If by *News-papers*, however, is meant documents intended for public information and amusement, at all resembling those of modern construction and freely circulated among the people, nothing, as we imagine, can be more remote from the original sense. Private *Diurna* were no more than daily memorandums of household and personal transactions. (Juv. vi. 485.) The *Acta Publica*, *Tabulæ*, *Commentarii*, *Diurna Urbis Acta*, *Acta Populi*, or simply *Acta*, were in like manner Public Registers of two sorts, one relating to transactions of the Senate, the other to National events. Julius Cæsar first commanded that Senatorial Registers should be compiled and published. (Suet. in vit. 20.) Augustus, acting upon a more narrow principle, jealously cleared the Gallery, as it were, and inhibited their publication. (*Id. in vit. 37.*) They were still, however, compiled by persons named *Actuarii*, who, in order to prevent disclosure to the unprivileged, were always Senators. The Emperor Hadrian performed this duty after he had been Quæstor. (Spartianus, 3.) The other *Acta* contained certain Registers. Thus we find a doubt relative to the natal place of Tiberius decided, because *sic in Fastos Actaque Publica relatum est*; (Suet. in vit. 5.) and so again Suetonius

*Acta Pub-
lica.*

appeals to the *Acta* to prove that Caligula was born at Antium. (*in vit. 8.*) The custom originated so early as the reign of Servius Tullius, who in order to obtain the Population Returns necessary for his *Census*, enjoined a payment in the Temple of Juno Lucina for every birth, in that of Venus Libitina for every death, and in that of Juventas for every one attaining manhood. Every Roman was also to register his own name, (*ἀπογράφεσθαι*.) and those of his parents, wife, and children. (Dion. Halicarn. iv. 15.) A similar registry was enjoined by a decree of Antoninus, which Capitolinus (*in vit. 9.*) mistakes for an original institution. Juvenal speaks of a wealthy, enervated debauchée, who by the assistance of his minion is able "to prove himself a man upon record," that is by inserting the names of reputed children, *libris Actorum*, (ix. 84.) upon which passage Gifford has the following note. "He alludes to the Public Registers in which parents were obliged to set down the names of their children a few days after their births. These Registers were kept in the Temple of Saturn, where they were open to all; and as besides births, they contained records of marriages, divorces, deaths, and other occurrences of the year, they were of singular use to the Historian, Antiquary, &c." The latter part of this note is borrowed from one by Lipsius on Suetonius above, (*Jul. Cæsar. 20.*) *Iis (Actis) continebantur res rationesque Populi, judicia publica, supplicia, comitia, ædificia, natiuitates, illustres mortes, matrimonia, divortia*; for each of which entries he cites authorities, (in some instances, perhaps, a little forced,) in an *Excursus* on Tacitus, *Annales V.* which treats the *Acta* at length. It is plain from Tacitus, however, that very ordinary public transactions, such as he considered beneath the dignity of professed History, were recorded

NEWS-PAPERS.

in the *Acta*. *Nerone secundum, L. Pisone Consulibus pauca memoriâ digna evenere, nisi cui libeat laudandis fundamentis et trabibus, quæis molem amphitheatri apud Campum Martis Cæsar extruxerat, volumina implere: cum ex dignitate Populi Romani repertum sit, res inlustres Annalibus, talia Diurnis Urbis Actis mandare.* (*Annal.* xiii. 31.) Ammianus Marcellinus has preserved from the *Acta* part of the record of a criminal sentence, adjudging exile to a Prætorian Præfect named Taurus, A. D. 361. Such Registries always commenced by naming first the Consuls, and then the offender. *Consulatu Tauri et Florentii, inducto sub præconibus Tauro, &c.*; and this formula was retained in the *Acta* of the early Christian Church also. (Eusebius, vii. 15.)

Mode of circulating the *Acta*.

These *Acta Diurna*, after having been registered, were certainly sometimes transcribed and circulated; not as *News-papers*, but as *News-letters*, (of which we shall have occasion to speak hereafter,) to such persons as chose to pay for them, as well perhaps as to others whose official situations demanded knowledge of public transactions. Hence they might get abroad, as Tacitus states, among the Provinces and Armies. Cicero, when writing to Cassius, affirms that he knows him to be thus in possession of News. *Scelus affinis tui Lepidi, summamque levitatem et inconstantiam, ex Actis quæ ad te mitti certè scio, cognosse te arbitror.* (*Ad Fam.* xii. 8.) And we have little doubt that a passage in Juvenal, (which, however, does not appear to have been so understood by Commentators and Translators,) refers to persons hired to extract from the *Acta*, on the same footing as the Writers of modern Newsletters. The Satirist, indignant at the depreciation of Literature, inquires

Quis dabit Historico, quantum dabit Acta legenti? vii. 104.

which Stapylton renders

Where is he
Will give the Historian an Attorney's fee?

and Gifford, wandering widely from the original,

One poor plodding scribe
Gets more, by framing pleas, than all the tribe.

Achaintre also, in his note, considers the *Actorum lector* as *un notaire ou greffier*. But what, it may be asked, has an Attorney to do in this place? "how gat he there?" The opposition required is to a *Historian*, and that opposition cannot be supplied by an Attorney. Surely Juvenal intended to express that the frivolous News of the day was a far more marketable commodity than graver History; and he asks, who is there will pay a Historian so good a price as he will offer to a Newsletter-Writer, who reads the *Acta* in order to extract from them for the amusement of his employer?

Chalmers's Historical account of News-papers

The History of Newspapers has been investigated with very great diligence by Mr. Chalmers in his *Life of Ruddiman*, and his opening paragraph is written in a style so full-mouthed and Johnsonian, that we cannot forbear borrowing it for our own commencement also.

Mercurius Gallo-Belgicus not a News paper.

"The origin of Newspapers, those pleasant vehicles of instruction, those entertaining companions of our mornings, has not yet been investigated with that precision which is undoubtedly due to what has been emphatically called one of the safe-guards of our privileges. We are still unacquainted with the name of our first Newspaper, and we are still ignorant of the epoch of its original publication." (102.) The *Mercurius Gallo-Belgicus* was long reputed to claim the honour of

priority; but that Work is rather an Annual Register than a Newspaper. It is written in Latin, and the first volume, compiled by M. Jansen, a Frisian, appeared in 1598 at Cologne. The first Venetian Gazette was produced yet earlier, in 1536. But the jealous Government of that State did not permit the circulation of printed News, and thirty MS. volumes from its commencement may be found in the Magliabecchian Library at Florence.

NEWS-PAPERS.

Venetian Gazette.

The research of Chalmers at length discovered that the first printed Newspaper appeared in England in 1588; when the wise policy of Burleigh took pains to prevent the circulation of false reports which might occasion panic, at that formidable period during which the British Channel was swept by the Spanish Armada. The title is "The English Mercurie, published by authority for the prevention of false Reportes, imprinted at London by Christopher Barker, her Highness' Printer, 1588." No 50 of that Newspaper is the first existing in the British Museum, (Sloane MSS. 4106.) and the News is announced from "Whitehall, July 23d." These Mercuries were not published daily, but at intervals, like Extraordinary Gazettes; and they appeared but rarely after the danger which gave them birth had passed away.

England produced the First News-paper.

A. D. 1588.

The English Mercurie.

The discovery of this Newspaper destroyed the hypothesis which had long attributed the invention to Theophrast Renaudot, a Physician, who obtained from Cardinal Richelieu, in April 1631, a Patent for a Weekly Paris Gazette. The first weekly Newspaper appeared ten years before that publication, in 1621, under the title of the *Courant or Weekly Newes from Foreign Parts*, and it was printed by Nathaniel Butter, who ere long, having many rivals, converted his weekly sheets into half-yearly volumes; *The Swedish Intelligencer*, 1630, *The German Intelligencer*, 1631. Butter is alluded to by Ben Jonson in *The Staple of News*, and Fletcher also notices him in the *Fair Maid of the Inn*. Of the various successors of this Parent of News-Literature ample Catalogues are given by Ruddiman in an Appendix, and by the yet more laborious John Nichols, in the IVth volume of his *Anecdotes of the XVIIIth Century*. From both of these sources we shall borrow indiscriminately, premising that if Chalmers's Catalogue be defective, that of Nichols is on the other hand supererogatory; for it contains many Works which have no relation to genuine Newspapers, such as Periodical Essays and Magazines.

Theophrast Renaudot.

A. D. 1631.

Nathaniel Butter.

A. D. 1621.

The period of the Great Rebellion was eminently fertile in Newspapers, and the Mercuries of that dismal season sprang up in number and in venom not unlike the heads of the Hydra. Among them we find *Mercurius Vapulans, Somniosus, Dogmaticus, Melancholicus, Pragmaticus, Clericus, Morbicus, Diabolicus, Mercurius Mercuriorum Stultissimus, Elencticus, Psittacus, Acheronticus, Insanus, Insanissimus, Icommaticus, Phreneticus, Zeticus, Mastix, Rhadamanthus, Nullus, Fumigosus, or the Smoking Nocturnal, Jocosus, Meretrix, Phanaticus*. In No. 7 of *The Impartial Intelligencer*, which commenced in March, 1648, is found the first regular advertisement. It is from a gentleman at Candish in Suffolk, respecting two horses which had been stolen from him. From 1655 to 1659, the two chief Newspapers were the *Public Intelligencer* and the *Mercurius Politicus*, both published by order of Parliament, under the Editorship of Marchmont Needham, who was discharged from that office, and prohibited from writing or publishing any "*publique intelligence*," when his Newspapers were continued after the Re-

News-papers abundant during the Great Rebellion.

storation; and who is pithily described by Anthony Wood as a "most seditious, mutable, and reviling author."

During the struggle between the King and the Rebels, each army carried a Printer about with it; and after the King's murder, Christopher Higgins, who had been sent by Cromwell to Leith in 1652, reprinted a London *Diurnal*, and the *Mercurius Politicus*. On the 31st of December, 1660, appeared at Edinburgh the first Scotch Newspaper of home manufacture, *Mercurius Caledoniensis*, edited by Thomas Sydserf, son of the Bishop of Orkney. The Editor is described to have been "very loyal, very illiterate, and very affected;" and his labours were weekly. In 1662 a warm debate occurred in the Irish Parliament relative to the propriety of allowing the publication of its Debates in the English Diurnals, and the Speaker in consequence wrote to Sir Edward Nicholls, Secretary of State, to enjoin a prohibition. (Lord Mountmorres, *History of Irish Parliament*, ii. 123.)

First Scotch Newspaper.

1662.

The Kingdom's Intelligencer.

A. D.

1663.

The Kingdom's Intelligencer, commenced in 1663, contains a greater variety of useful information than any of its predecessors, and there may be found in it somewhat of an Obituary; reports of the proceedings of Parliament, and of the Court of Claims; lists of the Judges' Circuits, of the Lent Preachers, of the Sheriffs, &c. Some curious advertisements also appear in its columns. "The Faculties office for granting Licences (by Act of Parliament) to eat flesh in any part of England is" announced to be "still kept at St. Paul's Chain, near St. Paul's Church Yard;" and the Public is warned as follows against a Literary Piracy. "There is stolen abroad, a most false and imperfect copy of a Poem, called *Hudibras*, without name either of Printer or Bookseller, as fit for so lame and spurious an impression. The true and perfect edition printed by the author's original, is sold by Richard Marriott, under St. Dunstan's Church in Fleet Street; that other nameless impression is a cheat, and will but abuse the Buyer as well as the Author, whose Poem deserves to have fallen into better hands."

Sir Roger L'Estrange.

The Intelligencer; published for the satisfaction and information of the People, was undertaken in 1663 by Roger L'Estrange, a personage afterwards knighted, and better known as Sir Roger; and that notorious Licenser and publicly accredited persecutor of the Liberty of the Press is said by Mr. Nichols to have infused into his Newspapers "more information, more entertainment, and more advertisements of importance, than (were contained in) any succeeding Paper whatever, previous to the Golden Age of Letters, which may be said to have commenced in the Reign of Queen Anne."

The Oxford

and London Gazette.

A. D.

1665.

Licenses required.

The *Oxford Gazette* (the Parent of the *London Gazette*, the Court at that time being at Oxford) made its first appearance on November 7—14, 1665, so that the first *London Gazette*, Feb. 1—5, 1665 is numbered 24. On May 12, 1680, was issued "a Proclamation for suppressing the printing and publishing unlicensed News-Books and Pamphlets of News," because it has become a common practice for evil-disposed persons to vend "to his Majesty's people all the idle and malicious reports that they could collect or invent, contrary to Law: the continuance whereof would in a short time endanger the Peace of the Kingdom; the same manifestly tending thereto, as has been declared by all his Majesty's Judges unanimously." The process, although no doubt rather summary, was not without its use, and might occasionally, in our own days, be used with considerable advantage. The rate of Advertisements, then

untaxed, may be learned from the *Jockey's Intelligencer, or Weekly Advertisements of Horses and Second-hand Coaches to be bought or sold*, 1683; in which we are informed that it is "price a shilling for a horse or coach, for notification, and sixpence for renewing." *The Flying Post*, in 1695, announces a plan of which we have very lately seen a revival with one remarkable difference, that the price, after the lapse of 150 years, has been reduced one-half. "If any gentleman has a mind to oblige his Country friend or correspondent with this account of public affairs, he may have it for 2d. of J. Salusbury at the Rising Sun in Cornhill, on a sheet of fine paper; half of which being blank, he may thereon write his own private business, or the material News of the day." Again in the following year we find Dawks's *News Letter* for the same purpose. "This Letter will be done upon good writing-paper, and blank space left, that any gentleman may write his own private business. It does undoubtedly exceed the best of the *written News*, contains double the quantity, is read with abundant more ease and pleasure, and will be useful to improve the younger sort in writing a curious hand."

The "written News" here mentioned were Letters written periodically by agents employed to collect News for individuals, some specimens of which may be found in (Aubrey's) *Letters from the Bodleian*. (i. p. 15.) In the *Observer Reformed*, Sept. 10, 1704, it is announced, "Advertisements of eight lines inserted for one shilling;" a proof of little increase of demand since 1683. Morphew's *County Gentleman's Courant*, two years afterwards, "as promotion of Trade is a matter which ought to be encouraged," advances the price to 2d. a line. The *General Postscript* of Oct. 24, 1709, thus characterises some of its more eminent Contemporaries. "The Weekly Papers being exceedingly barren and impertinent, the following Catalogue, we hope, will not be unacceptable to every English reader. The *Daily Courant* by Socinus Editor, a Modern Whig. The *Supplement* by Jacobus Abellius, a Postscriptorian. The *British Apollo* by a Society of Gentlemen consisting of Abenigo Simpleton only. The *General Remark* by the most learned and laborious Poveus, Projector and Operator extraordinary. The *Female Tatler* by Scandlosissima Scoundrelia and her two natural brothers. The *General Postscript* by Novellus Scandalus, an Ubiquitarian. The *London Gazette* by the Gazetteer. The *Postman* by M. Hugonotius Politicus Gallo-Anglus, a spiteful commentator. The *Flying Post* by Scotus Phanaticus, an Observer. The *Review* by Verbofus Enthusiasticus, a Modernist. The *Tatler* by Scriptor Furiosus, a Superintendent and Court Intelligencer. The *Rehearsal revived* by Agitator Maximus, an Antediluvian. The *Evening Post* by Compositor Fatuus, a defacer of Languages. The *Whisperer* by Mrs. Jenny Frivolous, a near relation to Jacobus Abellius the Postscriptorian. The *Post-boy Junior* by M. Boyerius, a famous Versioner. The *City Intelligencer* by Mr. Nibble-news, a Paragraphian." Most of the evanescent personal allusions here are naturally lost, but we recognise Toland the Socinian and Abel Roper; as for the *wit*, it seems very much on a par with that exhibited in the controversies of similar scribblers in our own times.

On Feb. 27, 1713, appeared *The Monthly Weather-paper*; being some Baroscopical discoveries from what part or parts of the Compass the wind may be likely to blow, with what sorts and alterations of the Weather may be expected every day and night in March; a guide, no

doubt, equally veritable with Moore's Almanack. A Stamp duty on all printed single sheets and half-sheets was imposed on the 2d August, 1712, and Swift humorously notices the occurrence in his *Journal to Stella*: (Aug. 7 :) "Do you know that Grub-street is dead and gone last week. No more Ghosts or Murders now for love or money. I plied it close the last fortnight, and published at least seven Papers of my own besides some of other people's; but now every single half-sheet pays a halfpenny to the Queen. *The Observer* is fallen; the *Medleys* are jumbled together with *The Flying Post*; *The Examiner* is deadly sick; *The Spectator* keeps up and doubles its price. I know not how long it will hold. Have you seen the red stamp the Papers are marked with? Methinks the stamping is worth a halfpenny." On the same day in August 1789, the Duty was enlarged o two-pence. By 16 George I. c. 26. persons selling unstamped Newspapers are liable to committal to the House of Correction for three months, and 20s. reward is offered to the Informer.

A. D.
1789.

Number of News-papers.

A. D.
1709

Mr. Chalmers, in an Appendix, (No. 6.) affords much Statistical information respecting Newspapers. So late as 1709 the only *Daily Newspaper* published was the *Daily Courant*. Seventeen others appeared thrice a week, one twice. A three years' average in 1753 gave 7,411,757 as the annual sale of Newspapers in England. In 1756, War having commenced, the sale rose to 10,394,146, in the year following to 11,300,980. In the succeeding three years the average again sank to 9,464,790.

A. D.
1756.

In 1790 the number printed was 14,035,639
1791 14,794,153
1792 15,005,780

A. D.
1792.

In 1792 there were published in London 13 daily, 20 evening, and 9 weekly Papers; in the country 70, and in Scotland 14. Since that date, notwithstanding the enormous increase in circulation of the leading Newspapers, and the more than commensurate improvement in every department connected with them, the number published in the Capital has by no means increased in proportion. The reason is obvious; the circulation is monopolized by Newspapers of established character, and the expense of competition, compared with the chances against success, is far too great to be rashly hazarded. We are indebted to the kindness of a Gentleman practically well acquainted with the subject for the following information relative to the present (1832) Newspaper Press.

Present state of the Newspaper Press.

A. D.
1832.

There are published in London 6 Daily Morning and 6 Daily Evening Newspapers; 3 twice a Week; 4 three times a Week; 18 Weekly; 15 on Sundays, perhaps 2 or 3 more on the last-named day with very little chance of continuance, in all 52, an increase of only 10 since 1792. The English Provincial Newspapers amount to 153, out of which Liverpool claims 7, Manchester 6, Exeter 5, Bath, Bristol, Sheffield, and York 4 each. The Isle of Man furnishes 1. Guernsey and Jersey each 3. Scotland 37, of which 11 belong to Edinburgh, 7 to Glasgow, 2 to each of the towns of Aberdeen, Dumfries, Dundee, Inverness, Kelso, Montrose, and Sterling. In Ireland are published 52, of which 13 belong to Dublin, 4 to Belfast, 3 to Cork, 3 to Waterford, and 2 to each of the towns of Clonmell, Galway, Kerry, Kilkenny, Limerick, Mayo, and Wexford. The sale of the *Times*, the leading Journal of London, exceeds 11,000 a day, and its profits have been computed at £30,000 a year. It has three Editors, the highest

salary of whom has been stated to be £1500 a year; 12 Regular Reporters and 3 supernumeraries are employed by it at 5 guineas a week, 3 readers, 2 publishers, a cashier and 3 clerks, 50 compositors on an average, 12 attendants on the machinery; News collectors, foreign correspondents and agents, together about 100. The *Morning Herald* establishment is scarcely less expensive than that of the *Times*, and its latter circulation has amounted to between 9000 and 10,000 daily. The expenses of an Evening Daily Newspaper are much less than those of a Morning one. Great part of its information is collected ready at hand, it is printed on smaller paper, and it contains less quantity of small type. The lowest price for an Advertisement (unless perhaps from servants) is 7s., and above ten lines 1s. is charged for every three or four more. A column in the *Times* cannot be purchased at less than from 10 to 15 guineas. The following Parliamentary Papers, with which we shall conclude, offer a comparative view of many contemporary Newspapers.

UPON-
TYNE.

tary fancy. The King threw him into prison, and when the Governor hesitated to deliver his master's fortress to the Royal troops, he was informed that the Tyrant had made a vow that the Bishop should neither eat nor drink till the Castle was surrendered. During the Baronial wars under John, this strong hold was often contested, and the King having lost all his baggage while crossing the *Washes*, retired into it for security, and died within its walls in 1216. Cardinal Wolsey lodged in it in 1536, on his way to Southwell; and so also did James I. on his route from Scotland after his accession in 1602. During the Great Rebellion, Newark formed one of the King's most loyal and powerful garrisons, and underwent three sieges, which it maintained with great gallantry. After its surrender, the Castle was demolished by the Parliament, nevertheless its shell still presents a magnificent ruin. The Northern front overlooks the river, and consists of a long line of curtain five stories in height, flanked at the Eastern angle by a square tower, and having another in its centre. Several of the windows are large and handsome, and belonging to the hall is one magnificent bay. Under the hall is an arched crypt, supported on pillars, and presenting loops and embrasures for cannon towards the river. A bridge crosses the Trent close to the Castle. It is carried for the most part upon dry land, as a security against the floods by which the roads before its construction were frequently made impassable. It consists of nine arches, and is a work of the celebrated Smeaton. The Church is a noble building of the time of Henry VI. richly decorated in the exterior with mullions, tracery, niches, and even statues, which have escaped Iconoclastic fury, and a light and handsome tower crowned with a lofty spire. Many of the windows still retain their painted glass, and the choir is enclosed by a carved wooden screen of choice workmanship. It is a Vicarage in the gift of the King. The Market-place is a handsome square, containing a Town-hall of elegant architecture. A Grammar School and a Town Gaol are the other public buildings, and many of the private houses are new and well built. The manufactures are chiefly cotton and linen, but Newark trades also in coal, wool, and malt, and it is the chief corn mart of the surrounding country. Its position also on the great North road is highly advantageous to it. The Charter by which it returns two Members to Parliament is the latest in our History, dating from the 29th Charles II. The voters are scot and lot payers. The government of the town is vested in a Mayor and twelve Aldermen. Population, in 1821, 8084. Distant 14 miles North-West from Grantham, 120 from London.

NEWCASTLE-UPON-TYNE, a Borough, Market Town, and Port, and in commercial importance and population the principal town in the district between the Tees and the Tweed. It is situated on the Northern bank of the river Tyne, about $8\frac{1}{2}$ miles West from the German Ocean, 273 miles North North-West of London, 117 miles South-East of Edinburgh, 15 miles North of Durham, and 56 miles East of Carlisle.

The site of this town was undoubtedly occupied at a very early period as a military station, and was, probably, the *Pons Ælii* of the Romans; in Bede's *Hist. Ecclesiastica*, it is styled *Ad Murum*, *regia Villa in lustris*; and it was also during the Saxon era, from its abounding in Religious Houses, very appropriately called Monkchester. Adrian's *Vallum* and Severus's Wall, both of which extended across the island from sea to sea, passed

through Newcastle, hence the designation *Ad Murum*. The origin of the present town may certainly be referred to William the Conqueror, by whom it was constituted a Borough, and by whom, or one of his sons, Robert or Rufus, the castle was built, whence it derives its name. The town seems soon to have become of some importance, and its revenue to have been considerable, probably derived rather from its mines of coal than from "the harvest of the river." Its earliest Charter extant is from Henry I., by which he confirmed "*probis hominibus de Novo Castello super Tinam et heredibus eorum villam nostram de Novo Castello cum omnibus proficuis pro centum libris.*" A Charter of King John mentions "*quingenta libræ numero,*" or £50 sterling, as the ancient fee-farm rent paid to the Crown. Henry III., in the year 1235, granted a Charter "to the men of Newcastle," which excluded all Jews from residing amongst them; and three years afterwards he gave them the land called the *Forth*, with leave "to dig stones and coals there." This Borough was originally part of the County of Northumberland; but Henry IV. granted a Charter, dated May 4, 1400, the effect of which was to constitute the ancient Borough a separate County to all intents and purposes; it has now its own Lord Lieutenant, Sheriff, Coroner, and other officers; it has its separate Assizes, and in fact possesses all the powers and privileges of a County. Queen Elizabeth, by Charter dated August 30, 1589, incorporated the Burgesses or inhabitants by the name of the "Mayor and Burgesses of the Town of Newcastle-upon-Tyne, in the County of the same." The governing body of the corporation consists of the Mayor, ten Aldermen, a Sheriff, and twenty-four Common Councilmen. There are likewise a Recorder, two Coroners, a Town Clerk, and other officers. The right of election of Members to serve in Parliament is in the free Burgesses at large, who acquire their freedom either by descent or servitude; all the sons of a free Burgess are entitled to the franchise of their father. The number of free Burgesses is about 4000. The number of houses in the town of £10 rental is computed at 2916, of which 404 are occupied by Burgesses.

The income of the Corporation of Newcastle is about £35,000 per annum; the annual allowance to the Mayor for maintaining hospitality in the Mansion House is 2000 guineas per annum, exclusive of a house and furniture, coach and horses, barge, service of plate, and coals.

This Borough-County, which is composed of four Townships, St. Nicholas, All Saints, St. John's, and St. Andrew's, is situated in the parish of St. Nicholas, in the Archdeaconry of Northumberland and Diocese of Durham; it is bounded on the South part by the County of Durham, and on other parts by the County of Northumberland: its circuit is ten miles and 1500 yards. The jurisdiction of the town comprises the river Tyne within the flowing of the tide, a space of about eighteen miles, viz. from Hedwin Streams, seven miles above the town, down to a rock in the sea called Sparhawk. The parish of St. Nicholas comprises besides the town several Townships in the County of Northumberland. The Benefice is a Vicarage endowed with all small tithes, but several moduses exist, and some species of tithe are not collected; the net annual value is supposed to be about £700 per annum. The Bishop of Carlisle is the Patron, and he and the Dean and Chapter of Carlisle are the owners of the Rectory or great tithes, in equal moieties. The parochial Chapelries of All Saints, St. John's, and

NEW
CASTLE-
UPON-
TYNE.

NEW-
CASTLE-
UPON-
TYNE.

St. Andrew's, in Newcastle, which are perpetual Curacies, respectively extend into Northumberland; their annual income may be stated at about £300 per annum each.

At Newcastle, the banks of the Tyne are steep, and of considerable height; the town rises along the hill and crowns the summit. In the ancient part of the town near the river, the streets, which are almost entirely occupied by shops, manufactories, and warehouses, are narrow and inconvenient; but the principal thoroughfares have been widened and improved, and many new streets have been built within the last twenty years, especially in the Northern and Eastern quarters of the town. The suburb, too, of Westgate, which is in the County of Northumberland, has lately been much increased, and many of its residences have a noble prospect of the river Tyne and the vales of Ravensworth and Derwent, in the adjoining County of Durham. The newer squares and streets are laid out in a handsome style, and the spirit of improvement and increasing prosperity of the place bid fair to render it equal in convenience and elegance to any Provincial town in the Kingdom. The view of the town from the opposite bank of the river is peculiarly grand and picturesque; the lower part of the foreground is occupied by the river Tyne and its shipping, and the spacious quay crowded with its busy throng and merchandise; the streets ascend and range along the acclivity till they reach the level, with here and there a fine and prominent object. Among the public buildings which are conspicuous, are the Court House for the County of Northumberland, with a noble portico, designed from the Parthenon, the old Castle of the town, the steeple of St. Nicholas, and the spire of All Saints. The Church of St. Nicholas was founded by the Conqueror, and the present edifice was raised, it is supposed, about the year 1359. It is 240 feet long, 75 feet broad, and the height of the tower is 194 feet. This tower is square, and at its four angles are lofty and highly ornamented spires, from whose bases spring transverse arches supporting a lantern of exquisite lightness and beauty, with smaller spires than those of the tower at its angles, and the principal spire rising to a great height from its centre. The steeple of St. Dunstan's in the East, London, was built by Sir Christopher Wren in imitation of it, but is greatly inferior. Attached to the Church of St. Nicholas are two Libraries, one belonging to the Corporation, and the other, which is considerable and very valuable, was bequeathed to the Town by Dr. Tomlinson. The parochial Chapel, or Church of All Saints, rebuilt in 1783, is a handsome Grecian building of a circular form, with a lofty and elegant spire, and an Ionic portico on the South. St. Thomas's Chapel, lately erected by the Hospital of St. Mary Magdalen, is a very handsome building in the early English style of architecture, with lancet windows and pointed arches. In 1824, a new Gaol was erected: it consists of a strong and lofty centre tower, with five radiating wings, and is well adapted for the safe custody and classification of prisoners. The Assembly Rooms, erected in 1766, at an expense of £6700, are elegant and commodious.

Of the ancient Norman Castle, little now remains but the tower, which is a noble object; it is about 80 feet high, 62 feet by 54 on the outside, and its walls 14 feet thick; its chapel and guard-room are generally visited by strangers, and from the top is a good panoramic view of the town and neighbourhood. The ancient walls of the town are supposed to have been built during the

XIIIth Century. Leland says, "The strength and magnificence of the walling of this town far passeth all the waulles of the cities of England, and most of the towns of Europe." The walls were 2 miles 239 yards in circumference; once containing seven gates of great strength, and seventeen round towers. Some of the towers and portions of the wall still remain, but the last gate (New Gate) was removed in 1823. The town possesses a most excellent market in a convenient situation.

Newcastle is well supplied with good water; there are numerous public fountains, locally called "pans," (probably a corruption of pond,) and a Company conveys it into houses and manufactories in all parts of the town.

Immediately adjoining Newcastle on the North and West is the Town Moor, an uninclosed pasture of about 1200 acres; the herbage is secured by Act of Parliament to the resident Burgesses and resident widows of deceased Burgesses, for the grazing of two milch cows each. This open district, which may well be styled the lungs of the town, is extremely valuable to the inhabitants as a resort for exercise, whether on horse or foot, free from the smoke and other annoyances of manufactures.

The manufactures of Newcastle and its vicinity are numerous and extensive. Amongst the principal are the iron and glass-works for which the banks of the Tyne have long been famous. The first glass-works on the river Tyne were established about the year 1619, by Sir Robert Mansell, Knight, who brought workmen from Lorraine, and had by proclamation the sole right of making glass in England granted to him on account of the great industry and capital he had employed in perfecting that manufacture with pit-coal, "whereby the woods and timber of this Kingdom were greatly preserved," and an additional impulse given to the staple commerce of this port. Since that period establishments for the manufacture of all kinds of glass have been rapidly increasing in this neighbourhood. At present (1831) there are on the river Tyne thirty-one glass-houses, viz. one for the manufacture of plate glass, fifteen for crown glass, six for flint glass, and nine for green bottles. It has been stated that more glass is manufactured on the river Tyne than in the whole Kingdom of France, and about two-fifths of the English glass is said to be made in this district. In 1810, it was estimated that the thirty glass-houses on the river Tyne manufactured goods to the amount of £499,000 annually, on which the sum of £181,000 was paid in duty. In 1812, the duties on glass were doubled, since which time the trade has experienced great fluctuations, though it is still conducted with considerable spirit, ingenuity, and success.

There are several large furnaces for smelting iron in the neighbourhood, and also a considerable number of extensive wrought-iron works, iron and brass foundries, and steel manufactories. Several thousand workmen are employed at these establishments in casting, forging, slitting, and rolling iron and steel into almost every form of which they are susceptible. Anchors, chain-cables, pumps, cylinders, cannon, steam-engines, and other massive articles are manufactured here; and also shovels, edge-tools, files, saws, kettles, nails, sheet iron, and all kinds of ironmongery. The largest wrought-iron works on the banks of the Tyne are at Swalwell and Weniaton.

Few places combine more conveniences for manufacturing every species of earthenware than the banks of the Tyne, where there are now about twenty potteries.

NEW-
CASTLE-
UPON-
TYNE.

NEW-
CASTLE-
UPON-
TYNE.

Flint and potters' clay are brought from the South of England in ships coming for coals, and the chief materials used for colouring and glazing are procured in the neighbourhood.

There are in the town and neighbourhood some large soaperies, a floor-cloth and two linen-yarn manufactories, several mustard and corn-mills, malt-kilns, breweries, oil-refineries, roperies, colour, paint, glue, and sail-cloth manufactories, paper-mills, tanneries, and chemical works for manufacturing oil of vitriol, cudbear, soda-water, alkali, sal ammoniac, copperas, vinegar, glauber salts, coal-tar, lamp-black, charcoal, coke, fig-blue, &c. Some years ago there were two sugar refineries in the town, but they are now disused. There are several establishments for converting pig-lead into ceruse and minium for pigments, and at two of them lead-shot is manufactured. The shot-tower at Low Elswick is 175 feet high; the shot is cast at the top of the tower, and by cooling as it falls, obtains that roundness and solidity for which it is esteemed by sportsmen.

But the coal-trade is the principal source of the prosperity of the town. The capital employed in this trade is estimated at £4,000,000 sterling; and in its various branches about 75,000 persons are engaged. Its produce has been calculated at £60,000 per week, and the duty paid to Government, which has been lately repealed, at £600,000 annually. This port is second only to London in the number and extent of its shipping; the number of ships registered at the Custom-house, Newcastle, is 1017, and their tonnage 206,687; it is computed that they are navigated by 9646 seamen. Laden vessels of upwards of 220 tons burthen easily navigate the river as high up as Newcastle bridge, and the quay of the town is one of the finest in England, being 580 yards in length. The principal exports besides coal, are lead, produced by the numerous mines in Allendale and Weardale, plate and other manufactured glass, earthenware, anchors, chain-cables, and other articles of naval ironmongery, steel, grindstones, &c. The foreign import trade of the port is very considerable, especially in corn and timber. Some vessels are annually employed in the Greenland whale-fishery. There are between fifty and sixty steam-vessels employed on this river, chiefly in carrying passengers and towing ships.

The salmon-fishery in the Tyne, once so abundant that it was provided in apprentices' indentures that they should not be fed with it oftener than twice a week, now affords only a small supply.

The following Table shows the quantity of coals shipped from the port of Newcastle, which includes Hartley and Blyth, small harbours on the coast of Northland, North of the Tyne. The figures in each column show the number of Newcastle chaldrons, one of which is nearly equal to two of the London measure, being in weight about 53 cwt. and containing 68 Winchester bushels, whilst the London chaldron is equal to only 36 Winchester bushels, and weighs 28 cwt. Eight Newcastle chaldrons make one keel, the boat or barge in which coals are conveyed from some collieries to the ships; and twenty-two chaldrons are called a *ten*.

	Newcastle.		Hartley and Blyth.	
	Coastwise.	Over-sea.	Coastwise.	Over-sea.
1791	404,367	45,702	39,619	127
1808	613,786	15,661	48,603	960
1816	678,151	43,783	49,417	771
1826	800,437	62,620	51,533	1395
1830	817,570	49,943	48,812	965

The markets are held on Tuesday and Saturday, and are numerous attended, especially that on Saturday, on which day there is a great influx of persons from the surrounding colliery villages. Newcastle has three fairs, viz. on the 12th of August, the 29th of October, and the 22d of November.

Newcastle has many charitable institutions, which are liberally supported. A General Infirmary, including a Lock Hospital, Dispensary, Lying-in-Hospital, Eye Infirmary, and Fever House. Nor are the interests of Science and Literature neglected: there is a Literary and Philosophical Institution, with a large and valuable Library and Museum; a Natural History Society, also with a Museum; an Antiquarian Society, possessing many valuable Roman antiquities, which have been found in the different stations on the wall; a Mechanic's Institution, possessing a valuable Library; a Botanical and Horticultural Society, at whose meetings prizes are given for fruits and vegetables. There is also a Northern Academy of Arts, where pictures by modern masters are annually exhibited, and an exhibition of Sculpture.

The population of the town, according to the census of 1831, is as follows: Township of St. Nicholas, 6126; of All Saints, 17,063; of St. John, 8135; and of St. Andrew, 11,436: total 42,760. But it should be noticed that the suburbs of the town are not included in this enumeration; they consist of the following Townships in the County of Northumberland: Westgate, with a population of 2996; Elswick, 787; Jesmond, 1393; Heaton, 501; and Byker, 5176: in all 108,53. Gateshead, in the County of Durham, which is also a suburb of the town, as Southwark is of London, contains a population of 15,177 inhabitants, and the following, therefore, is a summary of the whole population: within the limits of the town, 42,760; within the suburbs in Northumberland, 10,853; within the suburbs in Durham, 15,177: total 68,790.

Brand, *History of Newcastle*, 2 vols. 4to. 1789; Mackenzie, *History of Newcastle*, 4to. 1827; Parson and White, *Directory of the Counties of Durham, Northumberland, and Newcastle-upon-Tyne*, 2 vols. 12mo. 1827.

NEWCASTLE-UNDER-LINE, a Borough and Market Town in the County of Stafford, takes its name from the River Line, a branch of the Trent, upon the Eastern bank of which it stands, and from a fortress built in it by Edmund Earl of Lancaster, youngest son of Henry III., upon the decay of a more ancient castle in the neighbouring town of Chesterton. Of this latter castle scarcely a vestige is now remaining. Newcastle stands agreeably, the town is neat, but for the most part ancient, and the principal street clean and spacious. In earlier days it maintained four Churches, three of which were destroyed in the Barons' Wars, and that which now remains is only a Chapel to the Parish of Stoke. The town was incorporated by Henry I. and has received Charters from Elizabeth and Charles II. also. It is governed by a Mayor, two Justices, two Bailiffs, and twenty-four Common Councilmen, and has returned two Members to Parliament since 27th Edward III. The chief manufactures are pottery to a very great extent, cloth, and hats. Much of the coal in the neighbourhood is so soft as to be cut into slices, and it consumes too rapidly to be employed otherwise than in furnaces; the trade in other coal is very considerable, and much facilitated by the Grand Trent canal which passes

through the town. Newcastle is the birth-place of the Regicide Harrison. Population, in 1821, 7031. Distance from London 150 miles North-West.

NEWFOUNDLAND, a large Island of the British Empire, is adjacent to the Eastern coast of North America, from which it is separated by the Strait of Belle Isle, about twelve miles broad, and affording a passage practicable for vessels of any burthen, but intricate and dangerous. This Island is 300 miles long, 260 broad, and contains 35,000 square miles. It lies between $46^{\circ} 40'$ and $51^{\circ} 36'$ North latitude, and between $52^{\circ} 18'$ and $59^{\circ} 15'$ West longitude. The figure is very irregular, being deeply indented by numerous inlets which receive the streams that give exit to the water of the lakes abounding in the interior, and as the shores are generally bold, these land-locked bays present many excellent havens and roadsteads. In many places a beach of dry, clean pebbles extends along the water's edge and presents a surface admirably adapted for drying the fish afforded by the adjacent sea. Above, precipices of moderate height are crowned by groves of diminutive timber. Pennant, in his *Arctic Zoology*, represents some of the mountains as having a considerable height, and mentions Cape St. Mary, Chapeau Rouge, and Cape la Hune, on the South-Western coast, as attaining a great elevation. Little is known of the Country further inland than about thirty miles, as the settlers of the coast, a sea-faring people, find no inducement to undertake the labour and danger of exploring it. The face of the Country, as far as it has been explored, presents a succession of low steep hills covered with woods of stunted fir or birch, and interspersed with innumerable fresh-water lakes. The plains which occur are usually marshy, and overgrown with heath, though some are strewn with fragments of rock lying so close together as to preclude vegetation, and hence they bear the name of *Barrens*. The dreary woodlands are enlivened in Summer by the bloom of wild roses, and contain cherry trees, currant and gooseberry bushes, and a few other small fruit trees of indigenous growth. Potatoes and most of the common esculents of British gardens are cultivated with considerable success, but the moist, variable, and raw weather of the Summers does not allow corn to ripen.

Extensive beds of coal in some places reach down to the water's edge, so that it could with great facility be worked and shot into the holds of vessels anchored alongside. Vast deposits of pyrites occur on the Eastern shore, and their spontaneous combustion in wet weather sometimes exhibits pseudo-volcanic phenomena. The yellow colour and glittering appearance of this ore gave Sir Humphry Gilbert and other early navigators the erroneous impression that the Island contained rich mines of gold. The beautiful iridescent spar called Labrador stone occurs frequently.

Deer, beavers, hares, and their rapacious enemies, bears, foxes, and martens, abound in the woods, and are hunted during Winter, when the uniform hardness of the frozen surface renders every spot accessible. Then also the skin is most valuable, as wild quadrupeds acquire a close fur of unspotted whiteness, which on the approach of Summer is exchanged for the colour and texture usually belonging to the teguments of such creatures in more temperate climates. The genuine Newfoundland dog, the noblest variety of the species, grows to the size of a thriving calf of three months old. It retains in a considerable degree many of the propen-

sities of its unreclaimed nature, and though attached to its master, exhibits a dangerous ferocity if irritated, and even after the most careful training will, if unobserved, destroy all domestic animals which it can overpower. According to Anspach, it is still peculiar to the Island, as the variety known by the name in Europe is a degenerate mongrel.

The Winters, although severe, are less so than on the adjacent Continent. They generally set in early in November, and terminate at the end of April, although on the elevated Barrens the snow lies until the beginning of July. The North-Easterly winds are most dreaded, as they drive on the coasts immense fields of ice, which fill all the inlets, and extend over the surface of the sea for several miles from the shore. On the disruption of this accumulation by violent gales, such vessels as are not secured in landlocked havens are shattered into fragments, and their timbers are often set on fire by the violence of the collision and friction between the agitated masses of ice. The winds blowing over such a surface become loaded with frozen fogs, or *frost-smoke*, consisting of icy spiculæ, visible to the naked eye, and not only rendering exposure to the air painful, but penetrating into houses through the smallest apertures. In Spring, the thaw commences at the same time at the upper and lower surface of the snow, so that the middle stratum melts last. The ground is then found unfrozen to any depth, and vegetation is checked rather by the variableness than the extreme coldness of the weather, as a considerable degree of heat will, by a sudden transition, give place to gusty, raw, and chilling gales. Notwithstanding the ungenial nature of the climate, the finest fruits and vegetables are cheap and abundant, as they form the principal cargoes of the vessels which, during the fishing season, visit the Island from the West Indies and the South of Europe.

The capture of seals, morses, and other amphibious mammalia, forms a lucrative object of pursuit to the hardy islanders during the latter months of Winter. With admirable intrepidity, activity, and skill they conduct their barks to sea through casual openings in the ice, until they fall in with some seal-meadow, or field of ice occupied by those gregarious creatures, whose valuable skins and abundant oil yield a rich remuneration of these perilous enterprises. As the Spring advances, the boats and labour thus employed are transferred to the cod-fisheries, which we have already described under *GADUS*.

The population settled at St. John's, Placentia, Harbour Grace, and their dependent stations, was estimated by Colquhoun, in 1815, at 18,000, who kept 10,000 acres of land in cultivation; but the number has since so greatly increased that, according to the Report submitted to Parliament in 1824, it amounted to 100,000. The red Indian population is so scanty and so shy in approaching the settlements of white men, in consequence of injuries mutually inflicted and suffered, that it has been doubted whether any of them permanently occupy the Island, and whether those occasionally observed have not passed over from the Continent to hunt during the Summer months. Captain Buchan, however, who, in 1811, marched up the country a hundred and thirty miles, found in the depth of Winter a village containing seventy-five Indians, whom he in vain sought to conciliate, since after having with wanton barbarity killed two of his men, they sought refuge in remoter wilds.

haven, is situated at the extremity of a deep bay formed by two steep and high hills, which at the entrance are separated but by a narrow channel, and completely shelter the enclosed basin from every wind. It is well fortified, but the houses, built of wood, and only one story high, have a mean appearance, and are subject to frequent conflagrations, by one of which the town was, in 1816, almost completely destroyed, and property consumed to the value of £100,000. St. John's, in a commercial point of view, is a thriving place; and it has a weekly newspaper. The rental payable to proprietors resident in Britain exceeds £30,000 annually. The population is about 12,000. *Placentia*, a small place, has an excellent harbour capable of sheltering a hundred and fifty sail, and a convenient beach much frequented by those engaged in curing fish. *Harbour Grace*, the only other town, is small and unimportant. The fixed and circulating capital on the Island is estimated by Colquhoun at £1,973,000. The inhabitants of European descent are a robust, well-formed, healthy race, notwithstanding that salt-fish constitutes the main article of diet, being eaten three times a day. Its septic quality is counteracted by the copious use of tea, and still more by that of spruce beer, made of a decoction of the small branches of the black spruce and of molasses.

The total value of the exports of this important colony has in some years of the Revolutionary war exceeded £2,000,000 sterling annually. Of this amount the price of cod-fish constituted far the greater portion. In 1815, the quantity of cod-fish cured was 1,180,650 cwt. of which Spain, Portugal, and Italy took 952,116 cwt.; the rest was for the most part shipped for the West Indies. The salmon cured in the same year amounted to 2752 tierces. Herrings remain about the coast throughout the Winter, but the principal shoals visit it in May. Their capture forms an important department of fishery though greatly inferior to that of cod-fish. The capelin, a small and beautiful species of salmon, is a most delicious fish, and of great importance, as it is the best bait for cod. The capelin shoals, or skulls, as they are called, make their appearance in June, and are so dense and extensive as to change the colour of the Ocean. They are attended by innumerable grampuses and other voracious cetaceous species, and in a fine moonshine night the glittering of the shoals and of the cod-fish incessantly in motion and bounding to seize their prey, the unwieldy gambols of various species of whales, and the movements of the numerous boats employed in the fishery, constitute a most lively and interesting scene. The important interests vested in the fisheries were, during the late war with America, protected by sixty-one armed vessels, of which three were sail of the line. The total number of British vessels employed in the fishery, in 1816, was 795, measuring 102,186 tons, and employing 6018 men.

Of the Banks, which are the cause of the great value and importance of this colony, there are usually enumerated seven, lying to the South-East and South of the Island. The Great Bank extends from 41° to 50° North latitude, and from 48° to 53° West longitude. It is above 600 miles long and 120 broad. The soundings vary from 30 to 50 on the Southern part, from 10 to 30 in the middle, and deepen towards the North. The declivity of the bottom is very gradual on the Western side, while on the Eastern, soundings pass at once from 50 to 200 fathoms, and at a very short distance no bottom can be found. Some have considered these Banks bars deposited by the Gulf-stream retarded in consequence of the opposition of the Southern coast of the Island, but others, with more probability, conclude from their permanence and the steep inequalities of their surfaces, that they are submarine mountains, overspread with sand, but having a nucleus formed of rock or some tenacious clay. The Gulf-stream is easily distinguished from other parts of the Ocean by its bright blue hue; it is nearly 20 degrees warmer than the sea which washes the shores of Newfoundland; its incessant steaming covers the banks with fogs, rendered still more perilous to navigators by the violent gales and heavy swell which prevail there with little intermission. During Summer, enormous icebergs are brought from the Arctic Sea by currents setting from the North and North-West; these grounding at the depth sometimes of 30 or 40 fathoms, cause great danger to navigators, who amidst the fogs must carefully watch for the warnings afforded by the ice-blink and the noise of breakers. Purdy mentions one of these masses which grounded in 45 fathoms and was ten leagues in circumference.

According to the opinion of the most competent investigators, Newfoundland was discovered in 1001, by Biorn, a Norwegian rover, who named it Vinland, from the abundance of berries fit for producing fermented beverages. Malte-Brun considers it identical with Estotiland, (East Out-land, the land projecting Eastward,) explored in 1390 by the Italian navigator Zeno. It was again visited in 1496, by John Cabot, commissioned by Henry VII. King of England; and claimed in consequence by right of prior occupation, it is the most ancient, as it is one of the most important of the British Colonies.

NEW SOUTH WALES.

Position,
boundaries,
and extent.

NEW SOUTH WALES, a vast tract forming the Eastern part of *New HOLLAND*. From Cape York, which, in Southern latitude 10° 40', forms the Eastern headland of the Gulf of Carpentaria, to Cape Howe, in Southern latitude 39°, the Eastern coast extends above 2000 British miles. If we consider the meridian 140° East as the Western boundary of New South

Wales, the tract inclosed between this line, Torres Straits on the North, and the Pacific and Bass's Straits on the East and South, contains above 1,000,000 square British miles. The great promontory forming the Eastern boundary of the Gulf of Carpentaria, is in this point of view regarded as the Northern part of this great territory. The line of coast measured from the

bottom of the gulf just mentioned along its Eastern side, and then along the Eastern and Southern shores of New Holland, to the point where the meridian 140° East cuts the Southern coast, exceeds 3000 miles. The shore extending along the East of the Gulf of Carpentaria, a distance of 500 miles, terminated by Cape York, is low, sandy, barren, devoid of rivers and of havens. Proceeding round Cape York and continuing our survey Southward, we find the coast presenting similar features as far as the 15th degree of latitude. At that point a more fertile region commences, where the land rises into granite rocks of a moderate height. There is generally a deficiency of water, so that so far as the 22d degree, in a distance of 700 miles, no river has been discovered. A coral reef extends along this shore from the 10th to the 22d degree; its breadth at the Northern part is about 8 leagues, towards the Southern it widens to 15 leagues. The channel between it and the main land varies from 10 to 30 leagues in width, and the soundings from 20 to 60 fathoms. This reef, the greatest hitherto ascertained to exist, breaks the force of the sea rolling in from the Pacific, and renders navigation along the coast peculiarly easy and safe. It is difficult, however, to work a ship through it to the open sea, as, according to Flinders, (vol. ii. p. 102.) in a space of 350 miles, no considerable opening occurs. These huge labours of the *Zoolites* present a very beautiful appearance. Flinders thus describes them: "The water being very clear about the edge of the reef, a new creation, but imitative of the old, was presented to our view. We had wheatsheaves, mushrooms, stags' horns, cabbage leaves, and a variety of other forms, glowing under water with vivid tints of every shade between green, purple, brown, and white, equalling in beauty and excelling in grandeur the most favourite parterre of the curious florist. These were different species of coral."

A few small islands, the *Cumberland* and *Percy* groups, lie amidst these reefs; as they are covered with groves of the stately *Eucalyptus* and pines, and have some good roadsteads, they present great inducements for the settlement of seafaring colonists. At *Flat Island*, in latitude 22° , the tide rises thirty-six feet in an inlet forming an excellent harbour. To the Southward, the coast becomes bolder, rising into hills increasing in height towards the interior, and thickly clothed with forests of *Eucalyptus* and pines. The prevailing formations are granite and porphyry. Clusters of small islands fringe the coast. *Port Bowen* is a good haven in $22^{\circ} 30'$ latitude, and the surrounding country is overgrown with pines, the timber of which is superior to that of Norway. *Keppel Bay*, in $23^{\circ} 36'$ latitude, is an extensive inlet, affording safe and convenient anchorage. *Keppel Island* lies opposite its entrance, and being 25 miles long, with a breadth of 15, is the greatest along the whole extent of the Eastern coast. *Hervey's Bay*, in latitude 25° , is 50 miles wide at the entrance, and runs inland in a Southerly direction for the same distance. Its Eastern shore is formed by a low narrow peninsula, sandy and barren. *Moreton Bay*, in latitude 27° , has some excellent roadsteads; the navigable river Brisbane falls into it, and the abundance of fresh water and of timber, and great fertility of the adjacent country, point it out as destined ere long to be the site of a flourishing settlement. Oxley conjectures that the waters of the Brisbane proceed from the extensive and shallow lake which receives the Macquarie River, flowing inland from the vicinity of Port Jackson. The coast from the vicinity

of Moreton Bay is in general low, but not sandy, moderately fertile, and clothed with timber. In a few places, however, drifting hills of sand have overwhelmed the trees, the green tops of which may still be perceived above the surface. Some mountains of considerable height have been observed by navigators. Mount Warning, in latitude $28^{\circ} 20'$, and the Three Brothers, in latitude $31^{\circ} 36'$, are probably above 3000 feet high. *Port Stephens*, and *Port Hunter* which receives the Coal River, present themselves in close succession as we proceed Southward. *Broken Bay* extends inland to a considerable distance, and is divided into many creeks and inlets, forming some of the best havens in the World; two of them are described by Phillip as capable of containing all the Navy of England, and in addition to the waters of the Hawkesbury, cascades fall from the rocky and well-wooded shores. From an entrance not more than two miles across, *Port Jackson* gradually expands into a noble basin, having soundings sufficient to accommodate the largest vessels, and room for all that could be assembled. It runs thirteen miles into the country, forming two principal inlets, subdivided into above a hundred small coves. At *Sydney Cove*, on the most Southern of the two great inlets, is built the town of *Sydney*, destined probably in the lapse of a few generations to be the Capital of a mighty Empire. The shores inclosing Port Jackson are rocky, yet they were found by the first settlers thickly clothed with timber of considerable size. *Botany Bay*, a few miles South of Port Jackson, is extensive, but the anchorage is exposed to the South-East, and the shore is swampy and unhealthy. At *Jervis Bay*, in latitude 35° , unequivocal traces of volcanic action have been observed; pumice stone abounds, and strata of coal extend along the cliffs in the vicinity. Wilson's Promontory, in latitude $39^{\circ} 10'$, the most Southern point of New Holland, "the corner-stone to this new Continent," as Flinders styles it, is a lofty mass of hard granite. Bass's Straits, here thirty miles wide, separate this point from the North of Van Diemen's Land.

A great current sets from the West against Cape Leeuwin, the South-Western point of New Holland, and is divided by that headland into two lesser, of which one flows Northward along the Western coast, the other Eastward along the Southern shore, and through Bass's Straits. There, it meets the tide flowing in the opposite direction, and causing the great current setting to the East to disappear on the surface. This current is, according to Flinders, caused by the prevalence of the Westerly winds, which on an average blow during nine months of the year. The wind in general holds a contrary direction on the Eastern coast; from Cape Howe, where the shore assumes a Northerly direction to Sandy Cape, within a degree of the Tropic, the South-East trade-wind prevails during Summer from the beginning of October to the end of April. This steady aerial current is sometimes interrupted by sultry land-winds from the North-West, invariably followed by violent gales from the South-East, on the setting in of which the thermometer will sometimes fall 40 degrees, from 100 to 60, in less than an hour. During the Winter months the land or Westerly winds are more prevalent. In the intertropical part of this coast the Easterly trade-winds generally prevail during the Winter months, a Northerly wind bringing rain blows during the Summer from November to March. The current along the Eastern coast sets strongly to the South, sometimes at the rate of two miles an hour, except in the part North of Sandy Cape;

in latitude $24^{\circ} 26'$ North of that point the current sets Northward at a rate varying from half a mile to a mile an hour.

The absence of very high mountains is a striking characteristic of this great territory, in which particular it resembles the vast and humid plains drained by the Amazon and the River La Plata. The mountains hitherto discovered are confined to the Eastern coast, and hence the rivers there have but short courses and insignificant volumes of water. The *Blue Mountains* are the principal range, rising to an average height of about 2000 feet, and leaving an interval varying from 20 to 80 miles between their bases and the Pacific. Mount York, the highest point, is 3200 feet above the sea. They are very barren and rocky, consisting of sandstone, interspersed with quartz. Granite does not occur, though the traveller, pursuing his course through the interminable plain to the West, finds no other stone. Their breadth varies from 20 to 90 miles. A branch of this range, in latitude 36° , has been observed to be covered with snow during Winter, and its direction and aspect render it probable that it is continued so as to form a junction with the great South-Eastern headland Cape Howe. The lower parts of the Blue Mountains are covered with forests, the higher support a stunted and scanty growth of shrubs. Mount Warning, a detached eminence in latitude $28^{\circ} 30'$, is regarded as the highest point in New South Wales, but it has not yet been accurately measured.

The soil of *Liverpool Plains* is probably the richest in New South Wales. This extensive tract of level surface, clothed with a luxuriant growth of natural grasses, has an easy communication with Newcastle, built on the Southern shore of Port Hunter. The intervening Country is so level and open that a stage-coach might be driven through it with little difficulty. As the settlement formed on Liverpool Plains has the advantages of a very productive soil and great facility in the conveyance of produce to market, its prosperity is rapidly progressive. It is the most Northern of the inland settlements. Along its Southern boundary a rocky, precipitous, and nearly impassable ridge, extending Westward at right angles to the Blue Mountains, obstructs communication with the settlement of Bathurst.

In 1813 Cox's Pass was discovered, allowing access across the Blue Mountains to the Country extending Westward. That part lying due West of the Pass has a deep rich soil, and a gently undulating surface. It was soon occupied by a numerous body of settlers whose career in prosperity has been unexampled. *Bathurst* has, in the course of a few years, risen amidst the wilderness into a populous and thriving town, which already possesses a Literary Society, a Sporting Club, and a Classical School. It is situated on the Macquarie near its source. The triangular tract contained between the course of this river, the rocky ridge to the South of the Liverpool Plains, and the Blue Mountains, is rough, with various groups of eminences becoming continually lower to the West; and being in general well-watered and covered with forests amidst which many valleys open, offers inviting fields to the Colonist. The Macquarie flows to the North-West, and the Lachlan, of similar magnitude, runs from the same region to the South-West. The Country bounded North and South by these divaricating streams extends Westward to a low alluvial tract partaking of the character of the swamps in which the rivers terminate. Much of the Northern

part is hilly and fertile, but the Southern portion resembles, in aridity, flatness, and sterility, the Country through which the Lachlan flows. To the South-East of the Lachlan the Country rising towards the Blue Mountains is fertile, well wooded, and traversed by many small streams, generally running in a South-Western direction. Two small Lakes have been discovered about 60 miles to the West of Jervis Bay. Lake George is 15 miles long and 5 broad. Lake Bathurst is 5 miles long and 3 broad. The water, though having no outlet, is fresh, and presents a limitation of the position of some Geographers, that the contents of such reservoirs are invariably salt. The settlements in the vicinity of these are the most Southern to the Westward of the Blue Mountains.

To our former statements concerning the great internal Rivers, the following particulars may be added. The River *Brisbane*, emptying itself into Moreton Bay in latitude $27^{\circ} 23'$, is considered to have the longest course of any hitherto discovered along the Eastern coast. According to Oxley's last statement, it is navigable for vessels of burthen to the distance of at least 120 miles from its mouth, as it is not subject to inundations; he regards it as the outlet of the great reservoir which receives the numerous streams flowing into the interior of the country from the Western side of the Blue Mountains. The *Hawkesbury*, the upper part of which is called the *Nepean River*, falls into Broken Bay after a course of above 300 miles, being navigable for line of battle ships as far as Windsor, a distance of 130 miles. As it runs along the base of the Blue Mountains, from which it receives numerous torrents, it is subject to sudden and violent inundations, often rising 70 or 80 feet above the usual surface of the river, and in one instance to above 90 feet. These destructive floods often take place when no rain falls in the country Eastward of the Blue Mountains, in which tract the river holds the greater part of its course. The *Macquarie* takes its rise in latitude $33^{\circ} 40'$, at a point about 70 miles from the coast and 2669 feet above the sea. It has a North-Westerly direction, in which it has been explored for about 300 miles; for 250 miles of this distance the fall is very rapid, amounting to 750 feet in about 50 miles. The country through which it flows for 250 miles displays much picturesque beauty, and though rough and rocky is very fertile, as is usually the case where limestone abounds, of which and of granite, in about equal proportions, the eminences are formed. One portion, lying about 240 miles from the source, is described by Oxley as singularly rich and beautiful, consisting alternately of fine grazing grounds, fertile fields, and valleys; in which the river was sometimes contracted to a width of from 60 to 80 feet between rocky cliffs of vast perpendicular height and again expanded into magnificent reaches of the width of 200 feet, washing some of the most fertile tracts in the World. Leaving the hilly tract, it enters an alluvial country, completely level and overgrown with aquatic plants; after a course of 50 miles through this district it expands into a marsh every where covered with reeds, growing in water varying in depth from one foot to five. This remarkable spot is in latitude $30^{\circ} 40'$ North and longitude $147^{\circ} 10'$ East. The hypothesis that the water of this marsh finds its way to the sea by the channel of the Brisbane River has been already mentioned. The source of the *Lachlan*, nearly due West of that of the Macquarie, is about 90 miles further inland, and much

lower, being at the foot of a lofty range of the Blue Mountains, and in a spot but 600 feet above the level of the sea. The temperature here was found much lower than on the coast; the thermometer fell as low as 26° on the 22d of April, a time of year corresponding to the end of October in the Northern hemisphere. Limestone abounds here, and the country is level and clothed in grass or covered with forests of *Eucalyptus* and cypress. This inviting tract is, however, of no great extent, and the river holds its course for about 300 miles through a barren gravel, or hard and unproductive clay, and is lost amidst marshes overgrown with reeds. This marsh is drained by a river, the continuation of the Lachlan, flowing through a country level as the ocean, and having in general a surface of hard clay irreclaimably barren. After a course of 1200 miles it is lost in a reedy lake not more than three or four feet deep. In 1830 Captain Sturt explored a stream proceeding from this marshy lake, and found it to have a channel varying from 100 to 400 yards in breadth, and navigable throughout its whole extent, until it falls into Encounter Bay on the Southern coast of New Holland, in latitude $35^{\circ}44'$ North, longitude $138^{\circ}53'$ East. Besides these streams flowing Westward, others of considerable importance enter the sea on the Eastern coast. *Coal River* falls into Port Hunter, about 60 miles above Port Jackson; it is navigable for boats through a distance of 200 miles. A rich bed of coal stretches along its Southern bank, and is already extensively worked. Shoal Haven, about 120 miles South of Port Jackson, and Port Macquarie, about 400 miles North of the same port, receive considerable rivers.

Climate.

The equalizing effect of the trade-wind blowing over the vast expanse of the Pacific, and setting for the greater part of the year against the Eastern shore, causes the temperature to vary much less than might be expected from the great difference of latitude between the Northern and Southern parts. Flinders found the thermometer in May ranging from 60 to 67 degrees in the vicinity of Bass's Straits during September, and in the vicinity of Cape York, about 26 degrees nearer the Line, that instrument stood but at 72 degrees in September. Geological circumstances, however, produce considerable modifications, and in the tract of hard clay through which the Lachlan holds its course, the Winters are more severe and frosts more frequent and lasting than on the coast. The elevation of this tract is but 500 or 600 feet higher than the coast, and the severity of cold, producing ice of half an inch thick, must be attributed partly to the nature of the soil, but principally to the intervention of the Blue Mountains obstructing the influence of the Easterly wind, which here has some of the character of the zephyrs of the South of Europe. At Port Jackson, even Mid-winter produces only light hoar-frosts. Little rain falls there during that season, but frequent fogs deposit copious dews of great benefit to the young crops. In the vicinity of Port Jackson, the highest temperature during December (Midsummer) was found to be 102° , the lowest 47° , the mean 74° of Fahrenheit, and during June (or Mid-winter) the highest 67° , the lowest 26° , the mean 53° . The mean heat at noon during Summer is not much below 80° ; this heat is however mitigated on the coast by the sea-breeze which sets in about nine o'clock in the morning, and continues till six in the evening. The North-West wind, during Summer blowing over a vast extent of heated land, resembles the Sirocco, and produces very

distressing effects; it, however, seldom lasts above twelve hours, and is invariably superseded by a cold Southerly gale, during which the thermometer sinks suddenly nearly 40 degrees. The Autumn months, March, April, and May, are the season of rains, of which from 25 to 30 inches fall every year at Port Jackson. Though subject to a degree of heat at first incommodious to a British constitution, the climate, in consequence of the mitigation produced by the sea-breezes, soon becomes not only tolerable but agreeable to the colonist. It is in general highly salubrious. Diseases from natural causes are few, pulmonary consumption in moist parts of the coast being the chief. The abuse of spirituous liquors, fearfully prevalent among the lower class, produces abdominal complaints and cachexy, resembling sea-scurvy.

Diseases.

Nearly all the species of timber which constitute the extensive forests of New South Wales are evergreens, and *Melia Azedarach*, the common bead tree of India, is mentioned by an explorer as almost the only deciduous tree. The cabbage palm (*Corypha Australis*) formerly abounded about Port Jackson; the facility of working their soft spongy trunks has caused them to be all cut down in that part. They rise, however, to the height of 100 feet in tracts considerably further South. The arborescent fern, of inferior size, but beautiful, in consequence of its large feathery leaves, adorns the hills. The *Eucalyptus*, the noblest vegetable production of this Country, supplies a timber resembling coarse mahogany, and often fraudulently substituted for it; this timber is known in commerce by the name of bay-wood. The *Eucalyptus obliqua* is an evergreen growing above 100 feet in height, with a girth often exceeding 30 feet, and with its smooth trunk, long and slender branches, and smooth glossy leaves, is a striking object. The timber of one species of this tree is brittle, and it is valuable principally for affording a resinous juice resembling gum kino, in appearance and medicinal properties; a single tree will send forth sixty gallons from incisions made in its trunk. This abundance of gum resins which characterises the *Eucalypti*, and has caused them to receive the name of gum-trees from the settlers, produces difficulty in clearing the ground, as the roots do not decay, but must be carefully removed to render the ground capable of cultivation. The various species of *casuarina*, called beef-wood by the colonists, are lofty, large, and spreading, with singular leaves collected into bunches resembling horse-tails. The wood is hard, liable to decay, and of no great value. The red-cedar, *Cedrela*, is the most extensively employed of any of the timber of this Country, as it is tough, lasting, and easily worked; its usual height is about forty feet. The Norfolk Island pine and many other species of that genus abound along the coast. The Report drawn up by the order of Government concludes with this observation: "All the woods of New Holland are much given to the heart rot and shakes." The *Seaforthia elegans* is a large and beautiful palm; its leaves are used for hats and thatch, and the *spathæ* of the flowers are formed into milk-pails merely by tying up each end. Acacias occur in great numbers and variety, and with the *Eucalypti* are equal to all the other vegetable productions together. All the trees, from their scanty foliage and shade, are devoid of picturesque effect. From this circumstance, and the scantiness of underwood, the air even in the thickest forests is dry, pure, and amply oxygenated; and the ground in general so clear and level that game can be chased on horseback amidst the trees. The notes of

WALES.Singularity
of its Zo-
ology.

the birds correspond with the sombre aspect of the groves, and have caused them to receive from the settlers such singular names as whip-bird, razor-grinder, the laughing jackass, and others of equal euphony and promise to the sentimentalist.

The Zoology of this Country is as scanty as it is singular. The dog occurs every where wild. The size of this variety a little exceeds that of a fox, to which it bears great resemblance, and such are its strength and ferocity that it commits great havoc among domestic animals, and can with ease destroy a tame dog much larger than itself; it is a singular instance of a variety of this species nearly irreclaimable. Of the great variety of marsupial quadrupeds, the most remarkable are the forest kangaroo, (*Macropus major*), and the brush kangaroo. (*Macropus elegans*.) The wombat, (*Phascolomys*, Cuv.) a species of the marsupial quadrupeds, is about two feet long and one high, in girth a foot and a half; it is covered with a fine soft fur, lead-coloured on the back and white on the belly; the ears are short, erect, and pointed in the fore part of the body; it much resembles the bear, but lives on vegetable food, principally the tender shoots of trees. An anatomical description of this animal is given in the XCVIIIth Volume of the *Philosophical Transactions*. It is easily domesticated, and its flesh is palatable. The *Platypus*, or *Ornithorhynchus*, resembles a bird, in having but one fecal aperture, and hence is termed monotrematous. It is asserted that it lays eggs, but Cuvier (*Règne Animal*, vol. i. p. 234.) considers this problematical. Its muzzle, destitute of teeth, closely resembles the bill of a duck, its feet are webbed, and its tail is flat and suited for swimming; it is about the size of a rat, and feeds on worms and insects. The eagle of this Country (the *Falco fuscus*, Cuv.) is one of the most powerful and beautiful of the species. The emu, or cassowary of New South Wales, is destitute of the helmet-shaped horny crest belonging to most of the genus. It is seven feet high, has flesh resembling beef, is very fleet, and is chased with greyhounds by the settlers. The black swan (*Anas Platonia*) is the size of the European, and of a deep black, except the primary feathers of the wings, which are white, and the bill which is red. The rivers and coasts abound with excellent fish, notwithstanding the voracity of sharks more numerous and formidable here than in perhaps any other part of the World.

Productive
industry.

The agriculture of the Colony greatly resembles that of the Mother Country, except that the warmth of the climate renders maize a profitable crop, and does not allow oats or even barley to arrive at great perfection. Of wheat five quarters are usually produced to the acre, a return much exceeding the average in England: the maize crop is usually about ten quarters to the acre. The hoe is more used than the plough, in consequence of the obstructions occurring in the recently cleared soil. The natural grasses are luxurious and nutritious, and a custom prevails of setting fire to the harsh and parched stubble of stalks which remain after the Summer heats. An ensuing rain then causes the country to assume the appearance of a young field of wheat in England. As the grass falls away during the cool and dry months of Winter, the deficiency is supplied by turnips and green crops, cultivated to great extent. Wool, in all Ages invariably the most marketable of the products of rural industry, is the most important object of Australian farming. It appears from Parliamentary documents that 1,838,000 pounds were, in 1830, imported into Britain

from this Colony and Van Diemen's Land, and as it is of a fine quality, it probably averages above two shillings per pound, and consequently brings a return to the Colony of about £200,000 annually, a very great income to be divided amongst an insignificant number of landholders. The number of sheep in 1820, when Wentworth wrote, was 170,000: if we suppose that each sheep yields four pounds of wool, the number of those animals in Australia yielding wool for exportation must exceed 450,000, and if we take into consideration lambs and individuals the wool of which is not exported, the number probably exceeds 600,000. Land in the vicinity of the Capital lets at rents varying from £1 to £3 per acre, and sells usually for three or four years' purchase. Provisions in the towns are in general nearly as dear as in most parts of England. Although the prosperity of the Colony is rapidly progressive, the price of labour is low, an anomaly resulting from the constrained services of the convicts entering into competition with those of the free labourer. Free husbandmen receive from £20 to £30 annually; free mechanics, however, are well remunerated, earning 8s. or 10s. per day.

Almost every esculent vegetable produced in England Fruits, thrives here, except the bean and potato, both of which are found to degenerate. Every fruit capable of cultivation in Europe, from Naples to Denmark, grows here, and except the apple, the gooseberry, and the currant, they all attain the greatest perfection. The apple is produced in profusion, but as usually happens in the warmer parts of the temperate zone, its flavour is inferior to that produced in cool climates. Peaches are the most valuable productions of the Australian orchards. The different varieties succeed each other without intermission from November to March. They grow spontaneously on all soils, and three years after the peach-stone has been deposited in the soil the fruit may be gathered. They are used extensively as an article of diet, and so great is the profusion of them, that in most places they are largely used as food for hogs. The juice is fermented into a very pleasant and wholesome beverage. The more Northern part of the territory is well adapted for the growth of the sugar-cane, the middle for cotton, the Southern for the vine; and capital employed on these departments of industry will probably ere long cause great wealth to circulate amongst the population.

The settlements at present extend from Moreton Bay, in latitude 27°, to the vicinity of Shoal Bay, in latitude 35°, along a line of coast not less than 800 miles in length; in breadth they extend inland beyond Bathurst, to a point about 180 miles to the Westward of Port Jackson. The explored parts may by a rough approximation be estimated as equal in extent to England; the part actually occupied in cultivation or as grazing grounds, is about 1000 square miles, or between 600,000 and 700,000 acres. We find the principal settlements as we proceed from North to South, Moreton Bay, Port Macquarie, Newcastle on Coal River, Port Jackson, and Illiwarra, or Five Islands.

Sydney, the Capital of the Colony, is built on a cove Sydney, situated on the Southern side of Port Jackson. Its principal part lies on a tongue of land separating two coves, capable of containing vessels of the largest burthen, so that they may lay their broadsides against the quays. It is rather irregularly built, and covers much ground in proportion to its population, as each house is surrounded by a garden; this straggling style of building, however, will soon be terminated by the expense of

NEW

enumeration
of the
settlements.

NEW
SOUTH
WALES.
—
NEW-
PORT.

ground rent, since an acre has been sold for £1000. A house of moderate size and accommodation lets for £100 per annum. Sydney has two Parish Churches, a Presbyterian Chapel, one for Methodists, and one for Roman Catholics, a well-regulated Market, two Banks, the Bank of New South Wales and the Australian Bank, which discount at 8 per cent., and are so prosperous as to share 40 per cent. on their capital; two public Schools, one for each sex, and various other Institutions for the moral and intellectual improvement of the population. The *Sydney Gazette* is published daily, the *Australian* twice, and the *Monitor* once a week. The town lies in latitude 33° 55' North, longitude 151° 25' East. Its population is about 10,000. The Harbour of Port Jackson is navigable for vessels of the greatest burthen for seven miles beyond Sydney Cove, or 15 from its entrance; has every where excellent anchorage; is completely land-locked; and sufficiently spacious to contain all the shipping of England. The country surrounding the town is varied, picturesque, and beautiful in the highest degree. *Paramatta*, the usual residence of the Governor, is about 15 miles Westward of Sydney, at the point where a small river falls into Port Jackson. Its situation and appearance are very pleasing. The population is about 2000. The contiguous towns of *Windsor* and *Liverpool* are less important. The state of society is said to be very agreeable, and the inhabitants, retaining all the civilization of the Mother Country are fond of perpetuating its customs and tone of feeling, and on a small scale imitate its luxuries to a degree perhaps of weakness. The military force of the Colony consists usually of a regiment of the line and of the local military establishment called the Royal Veteran Company, and about 300 strong. Its trade is so active that above fifty vessels arrive annually from Europe and Asia.

Paramatta.

Windsor
and Liver-
pool.

Expense of
the Colony.

Population.

The total annual expense of the Colony of New South Wales in 1821, according to Parliamentary documents, (Public Accounts, 1823, xiv. p. 631.) amounted to £453,200.

The whole population of New South Wales amounted, in 1821, to 38,778, of whom not much more than one-third were women. If we assume one-third of this entire number as a reasonable increase by the natural course of reproduction in the eleven years which have elapsed since that time, the sum will exceed 50,000; and taking our average from the year 1821, during which 3563 convicts were transported to Australia, of which at least 3000 were assigned to New South Wales, and further setting the number of voluntary settlers against the number of deaths which have occurred among these convicts during 11 years, we must add 30,000 to the above-mentioned 50,000, and estimate the present amount of the population at 80,000.

On the arrival of a transport with convicts, orders are issued for returns of the number of men wanted by

each settler, and the quantity of land which he has in cultivation. The age, trade, character, and capacity of the convicts are investigated. The artificers are generally reserved for the service of Government, and as many of the others as may be requisite. Persons who have been in higher situations have tickets of leave given them, by which they have liberty to provide for themselves, and are exempted from compulsory labour. The remainder are distributed among the settlers as labourers and servants. The convicts in the service of Government are divided into gangs, placed under the management of overseers, usually themselves convicts distinguished for good conduct. The working hours are from six in the morning to three in the afternoon, and the remainder of the day may be spent by the convict either in amusement or profitable labour on his own account. They are clothed, fed, and lodged at the expense of Government.

The convicts distributed among the settlers are clothed, fed, and lodged by them. They work either by task or during the same number of hours as those in the service of Government, and the remainder of their time is at their own disposal. The master has no power of corporal punishment, which can be inflicted only by a magistrate, not himself the master, and the number of lashes may not exceed 300. The magistrate, on well-grounded complaint, may remove the convict from the control of the master. The annual expense of each convict is estimated at £40. At the expiration of the time for which they have been sentenced, they are at liberty either to return to Europe or to settle in the Colony, in which last case a grant of 40 acres of land is made to each unmarried man, and an additional portion for the wife and each child of such as have them. They also receive agricultural stock and provision for 18 months from the Government stores.

New South Wales was explored by Cook in 1770, and first colonized by Britain in 1788.

Norfolk Island, in latitude 29° 2' North and longitude 168° 16' East, is but 15 miles in circuit. It was colonized by a detachment from Port Jackson in 1788, but although very beautiful and fertile, and having one of the most delightful and wholesome climates in the World, yet its remote position, small extent, and want of a secure harbour, have caused its possession to be relinquished.

Norfolk
Island.

NEWPORT a Borough in the County of Cornwall, adjoining LAUNCESTON, to which it appears a suburb. From its connection with the Priory of St. Stephen it obtained some distinct privileges, and after the Dissolution it claimed the right of returning two Members to Parliament, which it has exercised since the 6th Edward VI. The Duke of Northumberland possesses the whole village, and two *Vianders*, chosen annually in his Court

Leet as Lord of the Manor, and the scot and lot inhabitants, in number about four-and-twenty, are the electors. *Launceston* stands pleasantly on the side of a steep hill sloping to the river Attery, which falls into the Tamar, three miles below the town. Its ancient name was *Dunheved*, the Swelling Hill; the present name, according to Borlase, signifies in British, the Church of the Castle. By others it is held to be a cor-

ruption of Llanstyphan, St. Stephen's Church. The Castle, the most important feature in the town, is attributed to the foundation of Robert, son of William Earl of Cornwall, a follower of the Conqueror; but some of the remains, especially those of the Keep, warrant a suspicion of much earlier and even British workmanship, to which the reputed founder probably added very largely. Carew, in 1602, states, that about sixty years before certain leather coins had been found among its walls; and that substance is known to have been employed for bullion by Edward I. during the erection of Caernarvon Castle. This fortress still continues attached to the Duchy of Cornwall, and during the Great Rebellion it long held out for the King. It was very strongly fortified, and covered a large extent of ground; the only portion now saved from ruin is a tower in the base court used till lately as a County Gaol, and now employed for the same purpose by the town. The Church of St. Mary Magdalen is a richly ornamented structure, enlarged from a Chantry Chapel in the reign of Henry VI. and again in that of Henry VIII. It is a Curacy in the Patronage of the King. The tower is lofty, and in a niche at the Eastern end is a fine recumbent figure of the Magdalene. The town consists of several narrow and three principal streets. It has returned two Members for Parliament since 23 Edward I. It has a Free school founded by Elizabeth; many of the women are employed in spinning wool, and here is a manufacture for serges. Population, in 1821, 2183. Distance from Bodmin 20 miles East, from Exeter 40, from London 214 West.

NEWT, Junius supposes to be corrupted from *an evet*; a *nevet*, a *newt*. See EFT.

Newts and blinde wormes do no wrong,
Come not neere our Fairy Queene.
Shakspeare. Midsummer Night's Dream, fol. 10.

The *Lacerta aquatica*, or water-newt, when young, hath four neat ramified fins, two on a side, growing out a little above its fore legs, to poise and keep its body upright, (which gives it the resemblance of a young fish,) which fall off when the legs are grown.
Derham. Physico-Theology, book iv. ch. viii. note 8.

NEWTON in the *Willows*, a Borough in the Parish of Winwick in the County of Lancashire, has returned two Members to Parliament since 1st Elizabeth. In *Domesday Book* it is mentioned as a Lordship of Edward the Confessor. The market has been long disused, but the Cross still exists in the churchyard. The town consists of one broad street plentifully studded with public-houses. It has a Chapel of ease. Fustian and Manchester goods are manufactured in it. Population, in 1821, 1643. Distant four and a half North from Warrington, 193 from London.

And there Marcus Cato, that never made ceremony or niceness to praise himself openly, nor reckoned it any shame to do it, did take a present occasion for it.

Sir Thomas North. *Plutarch*, fol. 295. *Marcus Cato*.

But human frailty nicely to unfold,
Distinguishes a satyr from a scold.

Buckinghamshire. *Essay on Poetry*.

You see how the scribes of the law, with much anxiety and niceness, confine themselves to the letter of Moses.

South. *Sermons*, vol. iv. p. 13.

It being well known that they were never bred to the niceties of logic, either in making syllogisms or dilemmas.

Id. *Ib.* vol. viii. p. 396.

By his own nicety of observation, he had already formed such a system of metrical harmony, as he never afterwards much needed, or much endeavoured to improve.

Johnson. *The Life of Waller*.

NICE, (or in Italian Nizza,) a Province of the Kingdom of Sardinia, is bounded on the North by Piedmont, East by the territory of Genoa, South by the Mediterranean Sea, West by France, from which it is divided by the river Varo. It contains 1365 square British miles, supporting a population of 124,000 persons, or 90 to the square mile. It is a very rough tract, over which the Alps extend, rising into the Col della Lunga, the Col di Tenda, and other remarkable summits. The Varo, the only river of importance, is often swollen by the melting snows in Spring, and rains in Autumn, so as to produce extensive and ruinous inundations. The sea-coast and valleys sheltered by the Alps from the North wind enjoy a mild, salubrious, and delightful climate, subject only to the inconvenience of the Mistral, a debilitating and sultry wind, blowing occasionally from the South. Winter is the most delightful time of the year, and the purity of the air, the mild temperature, and luxuriant vegetation recommend it as a retreat for invalids. It is in general a sterile tract, and from this cause, as well as from misgovernment, is ill cultivated,

VOL. XXV.

so that the corn crop is adequate to but a third of the demand, and the deficiency is supplied by importation, the expenditure resulting from which is counterbalanced principally by the sale of fruit, the staple produce of the soil. The olive yields an oil in great demand; oranges, pomegranates, figs, and almonds are produced in profusion, and of excellent quality. Honey and wine form important objects in the rural economy and exports of the Province. Much licorice is cultivated and prepared for market. The principal manufactures are silk and woollen cloths. The perfumery of Nice, especially rose and orange water, is celebrated and exported largely to Germany and the Levant. This territory encloses the diminutive Principality of Monaco, containing 55 square miles, (about double the extent of London,) with a population of 4898 persons. Monaco is held in Sovereignty by a Prince of the Grimaldi family, under the protection of the King of Sardinia.

Nice, the Capital of the Province, is situated on the shore of the Mediterranean, at the mouth of the small river Paglione. It has a haven, formed by a mole, and capable of containing 200 ships. The view from the quay over the Mediterranean is terminated by the mountains of Corsica, visible in that pure atmosphere at the distance of 100 miles. The greater part of this city is disagreeable and gloomy, with dark, narrow, and irregular streets; those of the new town, however, are wide, straight, and well built. It is a Bishop's See, and, in addition to the Cathedral, has two Parish Churches, and thirteen Convents for male and four for female cenobites. The permanent population is 19,000, but this number is greatly increased during Winter by the influx of invalids, who here have the advantage of a climate as mild as that of Naples. It is surrounded by ramparts, but not defensible against a vigorous and skilful attack. Latitude 43° 42' North. Longitude 4° 55' East.

Galanti, *Geography of the Dominions of the King of Sardinia*; (German Translation, Leipzig, 8vo. 1795;) Denina, *Tableau Historique, Statistique, &c. de la Haute Italie*, 8vo. Paris, 1805; Millin, *Voyage en Savoie*, &c. 2 vols. 8vo. Paris, 1816.

NICHE, It. *nicchia*; Fr. "*niche*"; a hollow seat, or standing for a statue or image, made (*i. e.* cut) into a wall." Cotgrave.

It is probably a *nick*, or *nook*, from the verb *nick*, to cut into; and usually applied as Cotgrave explains.

That the *nices*, if they contain figures of white stone or marble, be not coloured in their concavity too blacke.

Reliquiæ Wottonianæ, p. 61.

On the other side of Naples are the catacombs. These must have been full of stench and loathsomeness, if the dead bodies that lay in them were left to rot in open *niches*, as an eminent author of our own country imagines.

Addison. *Italy*, p. 138.

Gothic tombs owed their chief grandeur to rich canopies, fretwork, and abundance of small *niches* and trifling figures.

Walpole. *Anecdotes of Painting*, vol. iv. ch. v. p. 207.

NICK, *v.* } Junius refers to the D. *nicken*, *nictare*
NICK, *n.* } *oculis*; and Skinner, to the Ger. *nick*, a
NICKER. } nod; the word is used in English, as
equivalent to the Lat. *incidere*, to cut into.

To cut into; to cut a notch or hollow into; *sc.* into one thing to suit the reception of another; to make a suitable or convenient incision; to *nick* or do any thing in the *nick*; *i. e.* at a *fitting* time, suitably, conveniently, opportunely, seasonably, at the right moment, at a lucky moment.

NICK-
NAME.

To *nick* is, also, to cut a *notch* in a tally by way of reckoning or keeping account; and thus out of all *nick*, is out of reckoning; and to *nick*, is to cheat, (by cutting a *notch* fraudulently,) to impose upon, to play a trick of delusion or mockery: and hence, perhaps, to *nick-name*, *q. v.*

And the while
His man with cizers *nickes* him like a foole.
Shakspeare. The Comedy of Errors, fol. 98.

Ho. I tell you what Launce his man told me,
He lou'd her out of all *nicke*.

Id. The Two Gentlemen of Verona, fol. 33.

WILL. Think how to *nick* him home thou knowest, (she dotes on thee.)

Beaumont and Fletcher. The Little Thief, act i. sc. 1.

Why should he follow?

The itch of his affection should not then

Haue *nickt* his captain-ship at a point

When halfe to halfe the world oppos'd, he being

The meered question?

Shakspeare. Anthony and Cleopatra, fol. 356.

SCHOL. Does the sea stagger ye?

MAST. Now ye have hit the *nick*.

Beaumont and Fletcher. The Pilgrim, act iii. sc. 6.

God delivered them at the very *nick* of time, when they were but one remove, one hair's breadth from destruction.

South. Sermons, vol. ix. p. 113.

His scatter'd pence the flying *nicker* flings,
And with the copper shower the casement rings.

Gay. Trivia, book iii.

NICK, (Old.) In Dutch, says Wachter, *Nicker* is the Devil; and the name seems derived from the A. S. *næc-an*, to slay; for the Devil was a manslayer from the beginning.

"*Nicka* was the Gothic Demon, who inhabited the element of the water, and who strangled persons that were drowning," (Warton, *Hist. of Eng. Poetry*, Diss. 1.) and from him the name has been transferred, with the epithet "old," to the Devil of the Christian Theology. Butler gives Machiavel the credit of conferring the cognomen.

It is enough (quoth he) for once,
And has repriev'd thy forfeit bones:
Nick Machiavel had ne'er a trick,
(Though he gave his name to our *Old Nick*),
But was below the least of these,
That pass i' th' world for holiness.

Hudibras, part iii. can. 1. v. 1314.

NICK-NAME, *v.* } Junius imagines from *nom de*

NICK-NAME, *n.* } *nique*, an expression borrowed from the Italians, who use not only *iniquo*, but *niquo*. But see *ante*, NICK.

To impose a name in mockery or jest; from some real or imputed characteristic, or some act of the party.

Tiberius Nero propter nimiam vini aviditatem, saith Suetonius, by reason of his excessive drinking, was *nick-named* Biberius Mero.

Hakewill. Apologie, book iv. ch. vi. sec. 5. fol. 371.

Others auouch, and that more truelie, that he [Johannes Duns Scotus] was borne in Downe, an old ancient ciuitie in the north of Ireland, and thereof they ghesse him to be named *Dunensis*, and by contraction *Duns*, which terme is so triuiall and common in all schools, that whoso surpasseth others either in cauilling, sophistrie, or subtil philosophie, is forthwith *nick-named* a *Duns*.

Holinshed. The Description of Ireland, vol. vi. ch. i. p. 2.

For my mortale enemy hath falsely surmised me to bee a fayned person giuing mee *nicknames*, so abusing the world.

Bacon. King Henry VII. fol. 151.

From *nicknames*, or *nursenames*, came these (pardon me if it offend any, for it is but my coniecture,) Bill and Will for William, Clem for Clement, Nat for Nathaniel, Mab for Abraham, &c.

Cumden. Remaines, p. 131. *Surnames*.

And, instructed in the art of display, they utter with an air of plausibility this jargon, which they *nick-name* metaphysics.

Dr. Whitby. Five Points. Advertisement, p. 8.

The NICOBAR ISLANDS are the Southernmost of the two groups lying between the mouths of the Aírávatí, or Ava River, and the Point of Achín, at the Northern extremity of Sumatra, which, together with the Peninsula of Malacca, form the boundaries of a spacious basin, and are, probably, the summits of submarine mountains connecting that Island with the continent. They lie nearly between 6° and 9° North and 93° and 95° East, and, with the exception of Car-Nicobar and Trikút, are all hilly or even mountainous. They are broken into two groups, one consisting of nine, the other of three islands, with many adjacent rocks and islets. Car-Nicobar, one of those best known to Europeans, and the Northernmost of all, is at a considerable distance from the rest; the others in the principal group are Terressa, Tillangchong, Camorta or Komarti, Trikút, Nankáurí or Nankáverí, and Kachúl or Kachól, which are separated from the smaller group by the Sombréro (Broad-brim) channel. The latter are, Meróí or Malúí, Sambílong, and the Great Nikóbar, the largest of all. The proper application of these names is uncertain, as our Maps differ in that point from the accounts of travellers. The largest Island of the Southern group is called Nankáverí, or Nankáurí, (Fontana in *As. Res.* iii. 149.) of which Nikóbar is evidently a corruption. It is about five or six leagues in circumference, and measures about eight miles in diameter each way. (Colonel Colebrooke, *Ibid.* iv. 121.) Komarti, which is near it, though apparently more extensive, has probably a smaller area, being excavated by a large bay.* The third Island is called Cháurí or Sáurí, and Trikút, lying about a league to the East of the main island, shelters the Eastern entrance to the harbour nearly in the centre of the group, where ships of all sizes can ride with the greatest security about half a mile from the shore. "The inlet from the West is narrow," says Colonel Colebrooke, (*As. Res.* iv. 12.) "but sufficiently deep to admit the largest ships when the wind is fair." Danish Point, the Northernmost extremity of Nankáurí, was found by him, from a mean of eight observations for the latitude and three for the longitude, to be in 8° 2' 32" North and 93° 21' 30" East. (*As. Res.* iv. 312.) Hilly and woody, but seldom improved by cultivation, these Islands are unhealthy from the almost impenetrable forests with which they are covered. They produce naturally most of the fruits and vegetables found in the Indian Archipelago, particularly the delicious mangostan, (*Garcinia*), which is said to fail on the continent, and the mellóri, or léram, probably a variety of the *Pandanus odoratissimus*. Its fruit, shaped like a pine, and of the size of a large jáca, (*Artocarpus integrifolia*), is gathered when nearly ripe, and weighs between thirty and forty pounds. Its pulp, when sufficiently boiled and cleared of fibres, has nearly the appearance and taste of the

* Mr. Fontana, who lay at anchor in Nankáverí harbour for three months, says (*As. Res.* iv. 149.) that the largest and most populous of those Islands is Nankáverí, the second Sáurí or Cháurí, and the other Trikút, all closely situated; about 10 leagues to the North-East of them is another called Kachúl; he adds in a note, that an exact plan of them is given in the *Neptune Oriental*. To reconcile this with Major Rennell's Map, we must suppose his Camorta to be Fontana's Nankáurí, and his Trikút and Cháurí to change places. According to Colebrooke, Nankáurí and Sáurí are identical, Komarti is that of Rennell, and Trikút is Rennell's Nancoury. (*As. Res.* iv. 121.)

meal of Indian corn, and if kept dry and well covered, may be preserved for a long time. The kernels of its two nuts, in shape and taste, resemble almonds. Though called, not inaptly, the Nicobar bread-fruit, this tree approaches in habit to the palms and ferns, and differs widely from the *Artocarpus*, or bread-fruit of the South Sea Islands. Besides a variety of large timber-trees, cocoa and areca nuts abound; being almost the only vegetables cultivated and esteemed by the natives as furnishing them with food and their favourite luxury, for they have always a quid of the latter in their mouths. The shores are covered with excellent fish and the most splendid shells, and the rocks with the edible birds' nests so much in request among the Chinese. These nests, called *Sarang* by the Malays, are found in caverns inland as well as near the sea, in Sumatra, (Marsden, p. 174.) and are made by a species of swallows, (*Hirundo esculenta*), called *Salang-an* in the Philippine Islands, *Jaïmalani* in the Moluccas, and *Layang-layang* (the Soarers) in Sumatra. (*As. Res.* iii. 164. Buffon, *Oiseaux*, xix. p. 177. 184.) The chief material of which they are formed is a slimy, gelatinous substance found on the shore, the seaweed called *agal-agal*, and a soft greenish matter left by the tide upon the rocks. Fresh nests dried in the shade, are white and nearly pellucid. It has been supposed, also, that the bird uses the gelatinous body of the sea-slug, (*bicho do mar*), a species of holothuria, called *tripan* or *swálá* by the Malays. (Marsden, p. 175.) in the construction of its nest, which will account for its use among the Chinese, whose fondness for the *tripan*, as an ingredient in their soups, is well known. The natives of these Islands are copper-coloured, have yellowish, small, oblique eyes, flat noses, thick lips, and broad mouths; are short, well made, large eared, black haired, and beardless. The back of their head is violently compressed in infancy, and they shave their eye-brows. A narrow wrapper of cloth made of bark, folded round the waist, and passed between the legs, having its end hanging down behind, forms the whole of their attire, and gave occasion to the report of Kiöping, an old Swedish traveller, on whose authority Linnæus affirmed that the men sometimes had tails. The women are shorter than the men and wear a very diminutive petticoat made of cocoa-nut bark. Their beehive-shaped huts, covered with leaves of that tree, are raised on stakes five or six feet from the ground, (see plate in *As. Res.* iv. 121.) and usually inhabited by five or six persons. Building, fishing, and trading are the occupations of the men; field-labour, cooking, and other in-door work, the business of the women. Indolence is the most striking feature in their national character which is distinguished also by honesty, a virtue rarely found among Savages; "theft, robbery, and murder," says Colonel Colebrooke, (*As. Res.* iv. 125.) "are unknown in these Islands, though the natives will fight resolutely if attacked or unjustly dealt with." What their notions of Religion are, it is difficult to discover. They have no Idols; of a beneficent Deity they have scarcely any notion, and as they do not apprehend any mischief from him, they rarely ever think about him; but of a malevolent Deity, whom they believe to be the Creator of the World, and the author of all mischief, they are very apprehensive; poles are erected near every village with streamers formed by tufts of dried grass or strips of rattans, to frighten him away; but their chief protectors against his machinations are their Priests or Paters, who are both Physicians and Conjurers, and seem to be no common adepts

in the art of legerdemain. When unsuccessful, these sages throw the blame of their failure on some unoffending person, who is immediately the victim of their accusations. Various ceremonies are observed for the purpose of averting evil, and the changes of the moon are celebrated with great festivity. Their Funeral rites are the most remarkable of all their customs. The corpse, arrayed in all its finery, is laid out and vociferously lamented by the women, while the men drown their sorrow in copious draughts of *tadí*, (*aqua ardente*), and, once every year, the obsequies are renewed by the disinterment of the corpse. On the celebration of this anniversary, their huts are decorated with fruits, boughs, and garlands, all the inhabitants of the village assemble at the house of the Chief dressed in their best attire, the men smoke and get drunk, and the women nurse their children and attend to other domestic duties, till the sound of the *góng* in the afternoon gives them signal to shriek and howl without intermission till sunset. All then repair to the grave, and the woman, nearest of kin to the deceased, digs up his skull, weeps, and almost faints over it, clears it from earth, scrapes off the remains of flesh, washes it with cocoa-nut-milk, rubs it with saffron-water, wraps it up in a piece of new cloth, and again buries it in the earth whence it was taken. This ceremony is continued all night, and concluded by a sacrifice of fat hogs on the following morning, the whole party feasting on their flesh and getting as drunk as possible to show their regard for the deceased. (*As. Res.* iv. 123.) Late marriages and early debauchery are probably the chief causes of the want of population general in these Islands, the natives of which are peculiarly short-lived; seldom surviving the age of fifty years. The almost impervious forest by which their hamlets are surrounded must promote, if it do not occasion, fevers and pestilences, and to the elephantiasis, so common in the tropics, this people is peculiarly subject. These circumstances sufficiently account for the scantiness of their population. *Nánkáurí* and *Komártí* taken together had not, in 1790, more than 800 inhabitants. (*As. Res.* iv. 122.) Indolence, as before remarked, is their prevalent failing; they will not speak, when signs are sufficient to express their wants, and even on meeting each other they use no form of salutation. The cleverest man in the village is respected as a sort of Chief, but it is only by kindness and studying to please the rest that he can preserve his supremacy. Their quarrels are neither frequent, nor of long duration, clubs of mango-wood being their only weapons. Their very doubtful origin is not cleared up by their Language, which seems to have no affinity with that of the Malays, or of the neighbouring continent, or even with that of Car-Nicobar, the Northernmost Island of this group. (*As. Res.* ii. 341. iii. 157.) It is in 9° 7' North, nearly circular, about 40 miles in circumference, low, and thickly wooded, having a rich black soil, which produces much large timber, and is extremely fertile; poisonous serpents, and a kind of lizard which carries off poultry, are almost the only destructive animals. In make and features the natives nearly resemble their Southern neighbours; but their women shave their heads quite bare, which greatly increases their natural hideousness. In character, habits, and acquirements, they scarcely differ at all from the natives of the Southern Islands, and are equally remarkable for their honesty, dislike of ceremony, and taciturnity. Polygamy is said to be unknown among them, and adultery is severely punished. Their origin is

Funerals.

Island.

equally doubtful; for the current tradition, according to which their forefathers were settlers from Pégu and Malacca, is not supported by a comparison of their Language with those of the Eastern Peninsula, it does not even appear to have any affinity with the tongue of the other Nicóbar Islanders. The Danes had a small settlement on Nánkauri from 1756 till 1758, and another on Chauri was formed in 1768, but it was in a great measure given up in 1773, and in 1790 consisted only of a sergeant and three or four soldiers. Some Moravian Missionaries, however, continued there till 1787, when, finding their attempts to convert the natives fruitless, the post was finally abandoned.

The ANDAMAN (or more properly Andemáng*) Islands, which are a continuation of the same group, have been already noticed in this Work; but in addition to what has before been said, it may be observed that these Islands extend from 10° 32' to 13° 40' North, and from 61° 59' to 92° 6' East. The whole group consists of four larger and five smaller Islands, and a multitude of rocks and islets, without including Pepraes, the Ilhas dos Cocos, (Coco Islands,) Narcondam,† and Barren Island, to the North-East and East of the Andamans. The largest three are separated by such narrow channels and lie so exactly in the same line, that, till within a very few years, they were supposed to be parts of the same Island, and are represented in our Charts as "the Great Andaman." The natives, as may be collected from the description of them which we have already given, belong to the Papúas or Polynesian Negro-race, and differ entirely from the tawny Polynesians, to whom the people of Nikóbar, in complexion, make, and features, bear a strong resemblance. Their cannibalism has been disputed by later writers, but as that excess is now certainly known to prevail among the Negroes in Africa, so has it been observed to have originated with the Negroes among the Polynesians; from analogy, therefore, the cannibalism of these Islanders might be inferred; and it is positively affirmed by the Arabian navigators of the IXth Century. (Renaudot, *Anc. Rel.* p. 5.) Port Cornwallis, on the North-Eastern side of the Northernmost Island, is 11° 41' 23" North, and 92° 36' 32" East, (*As. Res.* iv. 314, 315.) and its shores, with those of the neighbouring Islands, are in the highest degree picturesque and beautiful. It was first occupied in 1793, but abandoned in 1796. No affinity can be traced between the corresponding terms in other Indian or Polynesian Tongues and any of the words in the vocabulary of the Andaman Language given by Colonel Colebrooke. (*As. Res.* iv. 393.) Barren Island, the last of those named above, is about 15 leagues East of the Andamans, in 12° 15' North, and deserves to be noticed as being a remarkable volcano, of which the base of the cone is very little higher than the level of the sea. It rises from deep water, as "a quarter of a mile from the shore there is no ground with 150 fathoms of line." (*As. Res.* iv. 396.) It was in great activity when visited by Captain Blair in 1787, and was still sending forth volumes of smoke and flame in 1822. The height of the cone is estimated at 1800 feet above the sea.

Hall. *Works*, vol. iii. fol. 438. *St. Paul's Combat*.

NICOTIANA, in *Botany*, a genus of the class *Pentandria*, order *Monogynia*, natural order *Solanææ*. Generic character: corolla funnel-shaped, border folded; stamens inclined; capsule two-valved, two-celled.

There are twelve species of this genus, the Tobacco, natives of America and New Holland. It is remarkable that, like the wheat, barley, and potato, the true *habitat* of the American species, *N. tabacum*, Virginian tobacco, is still uncertain: the genus is named, as stated above, in honour of M. Nicot, a French Ambassador, who received when at Lisbon seeds from Florida in 1560. The common name is derived from Tobacco, a Province of Yucatan in South America. *N. rustica* is the species most commonly cultivated. *N. undulata* is a native of New South Wales.

NI'CTATE, *v.* } Lat. *nictare*, to wink. Vossius
NICTA'TION, } from the ancient *nivere*, still re-
NI'CTITATE. } maining in the compound *connivere*.
To wink, to move the eye-lid quickly up and down.

Neither is it to be esteemed any defect or imperfection in the eyes of man that they want the seventh muscle, or the *nictating* membrane, which the eyes of many other animals are furnished withal; for though they be very useful, and in a manner necessary to them, considering their manner of living, yet they are not to man.

Ray. *Of the Creation*, part ii. p. 301.

Not only our *nictations* for the most part when we are awake, but also our nocturnal volutations in sleep, are performed with very little or no consciousness.

Cudworth. *Intellectual System*, fol. 161.

To the eye-lids we may add another guard afforded the eyes of most quadrupedes, birds, and fishes, by the *nictitating* membrane.

Derham. *Physico Theology*, book iv. ch. ii. p. 110. note 34.

NIDIFICA'TION, } Lat. *nidificatio*, from *nidifi-*
NIDULA'TION. } care, *i. e.* *nidum facere*, to
make, to build a nest, Gr. *νεοσσὺς*, *νεοττός*, from *νέος*, young.

The making or building of a nest.

And yet there is a great affinity betwixt the *nidifications* of birds and these conglomerations of the threads of the silk-worm.

More. *The Immortality of the Soul*, book iii. ch. xiii. fol. 221.

And so for insects, those little weak, those tender creatures; yet what admirable artists are they in this business of *nidification*.

Derham. *Physico-Theology*, book iv. ch. xiii. p. 233.

The ground of this popular practice might be the common opinion concerning the virtue prognostick of these birds, (king fisher;) the natural regard they have unto the winds and they unto them again, more especially remarkable in the time of their *nidulation*, and bringing forth their young.

Sir Thomas Brown. *Vulgar Errors*, book iii. ch. x.

NI'DING, } A. S. *nithing*; Sw. *niding*. In Fr.
NI'DGET. } *nigaud*, *nigaur*, are explained by Cot-
grave, a *nidget*, a fop, an idiot; the verb *niger*, to play the *nidget* or fop, to trifle, from the Lat. *nugari* (Ménage.) Spelman and Skinner have also *niderling*, or *nidering*, which the former would derive from the Anglo-

NIEREMBERGIA. A low, base, worthless fellow.

But there was one true English word of as great, if not greater force than them all, now out of al use, and wil be thought for sound barbarous; but therefore of more efficacie (as it pleaseth Porphyrie) and in signification it signifieth as it seemeth, no more than abiect, base-minded, false-hearted, coward, or *nidget*. Yet it hath levied armies, and subdued rebellious enemies; and that I may holde yon no longer, it is *niding*. (See *Nothing* in Junius.)

Camden. Remaines, p. 34. Languages.

NIDOUR. Lat. *nidor*; Fr. *nideur*, *nidoreux*.

NIDOROUS. The Latin *nidor*, properly, says Vossius, is the smell or odour of esculents, and sometimes of other things; perhaps from the Gr. *κνίσα*. Cotgrave calls the Fr. *nideur*, "the stench or fulsome savour of things broiled or burnt," and in English it is applied to the scent of meats dressed or dressing.

When the flesh-pots reek and the uncovered dishes send forth a *nidor* and hungry smells. Bishop Taylor. Sermons, p. 211.

Incense and *nidorous* smels (such as were of sacrifices) were thought to intoxicate the brain, and to dispose men to devotion: which they may do by a kind of sadness and contristation of the spirits; and partly also by heating, and exalting them.

Bacon. Natural History, Cent. x. sec. 932.

The signs of the functions of the stomach being depraved, are pains in the stomach many hours after repast, eructations either with the taste of the aliment, acid, *nidorose*, or fœtid, resembling the taste of rotten eggs, &c.

Arbuthnot. Of Aliments, &c. ch. i. prop. ii. sec. 6. p. 7.

NIEBUHRIA, in Botany, a genus of the class *Dodecandria*, order *Monogynia*, natural order *Capparidæ*. Generic character: calyx four-leaved; petals shorter than the calyx, or wanting; receptacle cylindrical, very short; berry ovate or cylindrical, on a foot-stalk.

Seven species, natives of Africa.

NIECE, Fr. *niece*, and *niepce*; It. *nezza*; in A. S. *nift*, which bears a manifest resemblance to *nefa*, a nephew; in Dutch, *nichte* is *cognata*, *neptis*; in Ger. *nift*, *nichte*; and in Goth. *nithyis* is *cognatus*, akin: and it is probable that the word has an origin in some term signifying generally, proximity, near relationship. The Etymologists, in general, refer it to the Lat. *neptis*,

The daughter of a brother or sister.

Seynt Edward's *nece*, þat of hys fader kunde come.

And of þe rygte kunde of Englonde, kyng Henry to wyue nome. R. Gloucester, p. 353.

Myselſe was from Verona banished,
For practising to steale away a lady,
And heire and *neece*, alide vnto the duke.

Shakspeare. The two Gentlemen of Verona, fol. 32.

NIEREMBERGIA, in Botany, a genus of the class *Pentandria*, order *Monogynia*, natural order *Convolvaceæ*. Generic character: corolla, tube very long, border expanded, throat plaited; stamens unequal; capsule two-celled, two-valved.

One species, *N. repens*, native of Chili.

NIEVRE, a Department of France, is nearly coextensive with the former Province, Nivernois, and is almost in the centre of the Kingdom. It is bounded on the North by the Departments of Loiret and Yonne; East by those of Cote d'Or and Soane and Loire; South by this last Department, and that of Allier; West by that of Cher. It is 60 miles in breadth from East to West, 66 in length from North to South, and contains 1608 square British miles, maintaining a population of 271,000 persons, or 168 to each mile. The North-Eastern part is overspread by the granite mountains of Morven, the upper parts of which are clothed with fine timber, of which a large quantity is every year floated down the Yonne to Paris. The lower parts of these mountains are covered with rich pastures, whence great numbers of oxen are sent to the same market. It is watered by the Yonne and the Loire, and its tributaries, the Aron and Nièvre, which being navigable for vessels of small burthen, supply the deficiency of roads, which are few and bad in this Department. The Western part is level, and has in general a soil which, though sandy, is productive of corn and wine; the vineyards of Pouilly, on the right bank of the Loire, are celebrated for their abundant produce of a white wine in much demand. Coal is dug up to a considerable extent in this Department, and its iron mines employ 1400 workmen, and supply that metal to the annual value of £400,000. Its districts, named after their chief towns, are Nevers, Clamecy, Cosne, and Chateau-Chinon. Nevers, the Capital, situated at the confluence of the Nièvre with the Loire, is a thriving place rapidly advancing in population, which has in the course of forty years increased from 7000 to 15,800 persons. This prosperity principally results from its extensive potteries, which consume annually 70,000 pounds of tin, and above 300,000 pounds of lead. Trinkets and small articles of haberdashery are manufactured in considerable quantity. It is an ill-built place, and its irregular and narrow streets, badly paved and badly lighted, have a gloomy and repulsive aspect to the traveller. Latitude 47° North, Longitude 3° 10' East. Clamecy is situated on the Yonne, and contains 5000 inhabitants. Cosne, situated on the Loire, contains 6000.

But yet me greveth most his *nigardie*.
Id. The Shipmannes Tale, v. 1302.

But these couetous *nigardes* passe on with pain alway y^e time
presēt, & alway spare al for their time to come.
Sir Thomas More. Workes, fol. 88. *A Treatise upon Wordes of
Scripture*.

Be not ye *nyggish*, & slothfull distributors of the doctryne that I
giue you, but put it forth laushly.

Udall. Mark, ch. iv.

Clings not his gutts with *niggeshe* fare to heape his chest with all.
Surrey. Ecclesiastes, ch. v.

Then shal he either *nygerdly* heape them vp together (whych is
you wot wel dāpnable) or wastefully mysse spend theym.
Sir Thomas More. Workes, fol. 1226. *A Dialogue of Comforte
againste Tribulation*.

But against him that is a *nigard* of his meat, the whole cite
shal murmure: the testimonies of his *nigardnes* shalbe sure.
Geneva Bible, Anno 1561. Ecclesiasticus, ch. xxxi. v. 24.

This couetous gathering and *nigardous* keping with al the delysts
y^t we take in beholding of our substance is in al oure lyfe but a
very gay golden dreame.

Sir Thomas More. Workes, fol. 94. *A Treatise upon Wordes of
Scripture*.

Surely like as the excesse of fare is to be iustly reprovēd, so in a
noble man moch pinchyng and *nygardshyp* of meate and drynke is
to be discommēded.

Sir Thomas Elyot. The Governour, book iii. ch. xxi.

When he had sufficiently stored hys cheste with treasure, re-
membryng hys honor, lest, he peradventure should be noted with
the spot of *nygardship*, he shewed hymselfe lyke a liberall and bene-
ficiall prince to his commons.

Hall. Edward IV. The fifteenth Yere.

Thou that art now the world's fresh ornament,
And only herald to the gaudy Spring
Within thine own bud buriest thy content
And, tender churl, mak'st waste in *niggerding*.

Shakspeare. Sonnet 1.

O God, as all our light is from thee, the Father of lights, so
make me no *niggard* of that poore rush-candle thou hast lighted in
my soule; make me more happy in giving light to others, than in
receiving it into myselfe.

Hall. Works, vol. ii. part ii. fol. 131. *Occasional Meditations*, xxxii.

For he, whose daies in wilfull woe are worne
The grace of his Creator doth despise,
That will not use his gifts for thankless *nigardise*.

Spenser. Faerie Queene, book iv. can. 8.

Wrong not thy fair youth, nor the world deprive
Of these rare parts which Nature hath thee lent;
'Twere pity thou by *niggardise* should'st thrive
Whose wealth by waxing craveth to be spent.

Drayton. The Legend of Matilda the Fair.

When fame first blazed thy beauty here in Court,
Mine ear repuls'd it, as a light report,
But when mine eyes saw what mine ear had heard,
They thought report too *niggardly* had spar'd.

Id. Edward IV. to Mrs. Shore.

If any man were invited thither to the feasts, and did refuse to
come, he did set a fine on his head, as reprovēg the miserable
niggardliness of the one, and the presumptuous arrogancy of the
other, to contemn and despise common order.

Sir Thomas North. Plutarch, fol. 77. *Solon*.

So, devotion is counterfeited by superstition; good thrift, by *ng-
gardliness*; charitie, with vain-glorious pride.
Hall. Works, vol. i. fol. 12. *Meditations and Vows*, Cent. i. 82.

But on the other side, there is not in nature any thing so remotely
distant from God, or so extremely opposite to him, as a greedy and
gripping *niggard*.

Barrow. Works, vol. i. fol. 441. *Sermon 31*.

So he, whom fate at once design'd
To plenty and a wretched mind,

Is but condemn'd t' a rich distress
And starves with *niggardly* excess.

Butler. Miscellaneous Thoughts.

The careless bard
Quits your worn threshold, and like honest Gay,
Contemns the *niggard* boon ye time so ill.

Shenston. Economy.

NIGELLA, in *Botany*, a genus of the class *Poly-
andria*, order *Pentagynia*, natural order *Ranunculaceæ*.
Generic character: calyx none; corolla, petals five;
nectaries five, three-cleft; capsules five, convex.

Five species, natives of the South of Europe, where
they are troublesome weeds in the corn fields. Several
of the species have been long cultivated in English gar-
dens by the name of Devil in the bush.

NIGH, *adj.* } Goth. *nehwa*; A. S. *nih, neh, neah*.

NIGH, *adv.* } See **NEAR**. There are also the Goth.

NIGH, *v.* } and A. S. verb *nehwan*, to approach,

NI'GHLY, } to come close to.

NI'GHNESS. } To *nigh*; to approach or come closer
to; to be or come close to, to approximate; to border
upon, to touch.

þe quene þo heo herde þis nei yswouyng was.

R. Gloucester, p. 35.

Fyue wynter holy lasted þat werre,
þat neuer Eilred our kyng durst negh him nerre.

R. Brunne, p. 41.

And be ye pacient and conferme ye youre hertis, for the comyng
of the Lord shal *neige*.

Wiclif. James, ch. v.

Be you also pacient therefore, and settle your hertes, for the
cōmyng of the Lord draweth *nye*.

Bible, Anno 1551.

Britheren nile ye be sorewful ech to othire, that ye be not demed,
lo the juge stondith *nyg* bifore the gate.

Wiclif. James, ch. v.

It were better worthy truly,
A worme to *nighen* nere my floure than thou.

Chaucer. Prologue to the Legend of Good Women.

And sithe kiss thou shalt my mouth,
Which to no villaine was never couth
For to approach it, ne for to touch,
For *saufe* of cherles I ne *vouch*
That they shall never *neigh* it nere.

Id. The Romant of the Rose, fol. 185.

Ful soth is this proverbe, it is no lie;
Men say right thus alway; "The *neighe* slie
Maketh oft time the fer leef to be lothe."

Id. The Milleres Tale, v. 3392.

As oft as I behold and see
The sovereign beautie that me bound,
The *nier* my comfort is to me,
Alas! the fresher is my wound.

Surrey. The Louer describes his restlesse state.

If the loue and dread of God, *nighnesse* of bloud, honour of the
world, law, and reason, had bound you, we suppose ye would neuer
haue so far proceeded.

Holinshed. The History of Scotland, Anno 1513, vol. v. p. 475.

We sometimes,
Who dwell this wild, constrain'd by want, come forth
To town or village *nigh* (*nighest* is far)
Where ought we hear, and curious are to hear,
What happ'ns new.

Milton. Paradise Regained, book i. l. 332.

Ah gentle pair, ye little think how *nigh*
Your change approaches, when all these delights
Will vanish, and deliver ye to woe,
More woe, the more your taste is now of joy.

Id. Paradise Lost, book iv. l. 364

Restless he pass'd the remnant of the night,
Till the fresh air proclaim'd the morning *nigh*;
And burning ships, the martyrs of the fight,
With paler fires beheld the eastern sky.

Dryden. Annus Mirabilis.

NIGH.

NIGHT.

Suppose a man born blind, and now adult, and taught by his touch to distinguish between a cube and sphere (suppose) of ivory, *nighy* of the same bigness, so as to tell when he felt one and t'other.
Molyneux to Locke. March 2, 1693.

Yet ev'n these bones from insult to protect,
Some frail memorial still erected *nigh*,
With uncouth rhymes and shapeless sculpture deck'd,
Implores the passing tribute of a sigh.
Gray. Elegy. Written in a Country Church-yard.

And the day bigan to bowe down. Wic. The Gr. *νύξ*
is derived from *νέειν, inclinare*, to bend or bow down.
Martinius: and the Gr. is probably from the Gothic.

The time when the sun, or the light of the sun, goes,
and is gone down; lit. and met. darkness, gloom, igno-
rance.

Night is much used in Composition.

Ne hii ne mygte yse vor þe *nygte* þe batayle to do non ende.
R. Gloucester, p. 305.

& God sent him tokenyng on *nygt* als he slepe.
R. Brunne, p. 31.

But in the fourthe wakyng off the *nyght* he cam to hem walkyng
above the see. *Wiclif. Matthew, ch. xiv.*

And in the fourth watche of the *night* Jesus came vnto theym
walckyng on the sea. *Bible, Anno 1551.*

And fell so that by *nightes* tide.
Gower. Conf. Am. book ii. p. 53.

But if thou chaunce to fall to check,
and force on erie fowle,
Thou shalt be worse detested then,
than is the *nightish* owle.

Turbervile. The Louer, against one that compared his Mistress to his
Lady.

But lo, yet neuer was there *nightly* fantome
So farre in errour, as he is from his wit,
To plain on vs.

Wyat. Complaint vpon Loue, &c.

Shore's wife was one also of his most secret counsel of thys hey-
nous tresō w^e he lay *nightlic*.

Sir Thomas More. Workes, fol. 56. Richard III.

— Edmund, I thinke, is gone
In pity of his misery, to dispatch
His *nighted* life.

Shakspeare. Lear, fol. 303.

Such is that wand'ring *nightly* shame which leades
Th' unwary passenger, vntil he treads
His last step on the steepe and craggy walles
Of some high mountain, whence he headlong falls.
Beaumont. Against Absurd Loue.

GAL. Pride comfort your head-piece, lady; 'tis a weak one, and
need of a *night-cap*.

Beaumont and Fletcher. Philaster, act i. sc. 1.

Great mountains have a perception of the disposition of the aire
to tempests, sooner than the valleys or plaines below. And there-
fore they say in Wales, when certain hills have their *night-caps* on,
they mean mischief.

Bacon. Natural History, Cent. ix. sec. 819.

Ah! would thou know'st how much it better were
To 'bide among the simple fisher-swaines;
No shrieking owl, no *night-crow* lodgeth here,
Nor is our simple pleasure mixt with pains.

P. Fletcher. Piscatory Eclogues, ecl. i. 18.

And after him owls and *night-ravens* flew,
The hateful messengers of heavy things,
Of death and dolor telling sad tidings.

Spenser. Faerie Queene, book ii. can. 7.

DUKE. What is't you look for, sir, have you lost any thing?
JOHN. Only my hat ith' scuffle; sure these fellows
Were *night-snaps*.

Beaumont and Fletcher. The Chances, act ii. sc. 1

And as those *nightly* tapers disappear,
When day's bright lord ascends our hemisphere;
So pale grows Reason at Religion's sight;
So dies, and so dissolves in supernatural light.

Dryden. Religio Laici.

NIGHTERTALE, *nighter-deal*, the nocturnal (*deal*
or) portion of the natural day. Skinner.

So hote he loved, that by *nightertale*
He slep no more than doth the nightingale.

Chaucer. Prologue to the Canterbury Tales, v. 97.

"Arise, (quod she,) what haue you dronken dwale, (i. e. sleeping
draught,)

Why slepen ye it is no *nitertale*."

Id. The Court of Loue, p. 375.

NIGHTINGALE, A. S. *nicht-gale*; D. *nacht-gael*;
Ger. *nachtigal*, from *nicht*, the night, and *galan*, to gale,
to sing; because he *sings* at *night*. See the first Quota-
tion from Chaucer.

The trivial name of the *Motacilla Luscinia* of Lin-
næus.

To matens went the lusty *nightingale*,
Within a temple shapen hauthorn wise,
He might not sleepe in all the *nightertale*,
But *Domine labia* gan he cry and *gale*.

Chaucer. The Court of Loue, v. 1357.

The *nightingale* with so merry a note
Answered him, that all the wood rong
So sodainly, that as it were a sote
I stood astonied; so was I with the song
Thorow rauished, that till late and long,
I ne wist in what place I was, ne where,
And ayen me thought she song euen by mine ere.

Id. The Flower and the Leaf, p. 395.

Her short performance was no sooner try'd,
When she I sought, the *nightingale* reply'd:
So sweet, so shrill, so variously she sung,
That the grove echo'd, and the valleys rung:
And I so ravish'd with her heav'nly note,
I stood intranc'd, and had no room for thought.
But all o'er-pow'r'd with extasy of bliss,
Was in a pleasing dream of Paradise.

Dryden. The Flower and the Leaf.

NIGHTMARE, D. *nacht-merrie*; Ger. *nachtmar*.
In Sw. *mara* is incubus; in Ger. *mære*, Parca; but
Skinner thinks that *mare* in *night-mare* is *Equa quæ*
nobis accubat, vel porticis incubat. Warton (see the
Quotation from him) gives the true origin of our word;
though it does not appear why "the spirit or spectre of
the night" was in Runic Theology called *mara*. And
see INCUBUS.

Jesu Crist, and seint Benedight,
Blesse this hous from euery wicked whit,
Fro the *nightes-mare*.

Chaucer. The Milleres Tale, v. 3481.

Onely refering unto Christian considerations, what natural effects
can reasonably be expected, when, to prevent the ephialtes, or *night-*
mare we hang up an hollow stone in our stables.

Sir Thomas Brown. Vulgar Errors, book v. ch. xxii. p. 330.

Mara, from whence our *night-mare* is derived, was, in the Runic
Theology, a spirit or spectre of the night, which seized men in their
sleep, and suddenly deprived them of speech and motion.

Warton. History of English Poetry, vol. i. diss. 1.

NIGHTSPELL, i. e. the night-charm. Tyrrwhitt.

Therewith the *nightspel* said he anon rightes.

Chaucer. The Milleres Tale, v. 3480.

SPELL.

N I G R I T I A.

NIGRI-TIA. Name and extent.	NIGRITIA, a term of comparatively modern use, corresponding with the Arabian phrase Biládu-s-súdán, <i>i. e.</i> The Land of the Negroes, comprehends in its widest signification all that part of the African Peninsula which lies South of the Sahrá, or Great Desert; but the Arabs, from whom it was perhaps borrowed, restricted it to narrower limits than those of the Inner Ethiopia, which are thus determined by Ptolemy. (iv. 9.) "That part of Æthiopia which lies below this Country (Meroë) and the whole of Libya, is bounded on the North by the lines before laid down, extending from the Great Gulf of the External Sea (the Atlantic Ocean) to the Promontory Rhaptum already mentioned, in 73° 50' East and 8° 25' South, and by a part of the Western Ocean in the Great Gulf; on the West and South by an unknown land; on the East by a line drawn across the Barbaric Gulf from the Promontory Rhaptum to the Promontory Prasum, in 80° 45' East and 15° South, and the unknown country beyond it." This embraced the whole of Southern Africa known to the Greeks, as it extended from the Western to the Eastern shore, and with the exception of Ethiopia comprehended the whole region inhabited by Negroes; but the Bilád-el-súdán* of the Arabs, and the Nigritia of modern Geographers, corresponds more nearly with the Land of the Nigritæ of Pliny. Its limits are not clearly defined by the earlier Arabian Geographers, who do little more than mark its distance from various places in Northern Africa, and its separation from Barbary, Biládu-l jeríd, and Egypt, by the Great Sahrá, or Sandy Desert. With Nigritia, in this limited acceptation, they were very imperfectly acquainted, and to the regions South of the Niger, they were almost entirely strangers; so that to reconcile their accounts with what is at present known, or what Ptolemy has recorded, is not an easy task; nor would it be in any degree practicable but for the aid afforded by Al Bekrí, Ibn Batútah, and Leo Africanus. To the last, indeed, we owe the first distinct account of the region comprehended by his Countrymen under phrase of Bilád-el-súdán. "The fourth part" (of Africa,) he says, (p. 6.) "is Nigritia, which begins in the East with the Kingdom of Gaogao, (Gaú gaú,) and extends Westward as far as the Kingdom of Valata, (Walátah,) being bounded on the North by the Libyan Desert, (the Sahrá,) and reaching Southward to the Ocean." Leo, therefore, did not include the Sáhil, or Shore of the Atlantic in the parallel of Walátah, (the Walet of our Maps,) nor Dár Fúr and the territories East of the Lake Fitrí, within the limits of Nigritia, and in making the Ocean its Southern boundary, he was guided by what he had learnt from European navigators, not by the result of his inquiries in the Country itself. The natural boundaries of the area formed by the course of the Niger, from which, according to Pliny, (v. 8.) the Nigritæ received their name, seem to be the Desert on the North, the chain of mountains which gives rise to that stream and its tributaries on the West and South, and the hills or deserts which	separate Bornú and Bágirmí from Dár Fúr on the East; of the latter tract of country our accounts are still too vague and uncertain to allow of any satisfactory conclusions as to its condition, Physical or Moral. Few travellers in ancient or modern times, seem ever to have passed in a direct line from the banks of the Niger to the Nile; and few even of the more enlightened Africans trouble themselves about Geographical inquiries; hence their prevailing notions of the identity of the Niger and the Nile; while dissensions between the petty Chiefs whose territories separate Dár Fúr from Bornú, and the danger of being entrapped by slave-hunters, have from time immemorial driven even the penniless Fúláh Pilgrims to the more circuitous but securer route along the shores of the Mediterranean, in their way to Meccá. "Negroland," says Leo, (p. 10.) who visited it early in the XVIth Century, "is divided into many Kingdoms, some of which are unknown, and have not been visited by me. I shall speak of those which I myself have seen and with which I am well acquainted, and also of the others, from which there were merchants trading in the Countries where I dwelt, who gave me sufficient accounts of their native land. I have been in fifteen Negro Kingdoms, the number of those in which I have not been is three times as great, and these, from being near, were well known in the places where I was. The names of the latter, beginning from the West, and proceeding East and Southward, are: Gualata. Ginea, Melli, Tombutto, Gago, Guber, Agadez, Cano, Casena, Zegzeg, Zanfara, Guangara, Burno, Gaoga, Nubé. Most of these fifteen Kingdoms lie on the River Niger, and the merchants who travel from Gualata to Caíro, follow the road through them, which is long, but very secure. They lie the one apart from the other, and ten are separated from each other either by a desert of sand, or by the River Niger." They were then subject to three Sovereigns, of whom the most powerful was the King of Tombuktú, the next the King of Gaó-gaó, and the least considerable the King of Bornú. Núbah, or Nubia, subject to the King of Ducala, (Dunkalah, or Dongolah,) was only a small territory; so that Dár Fúr was probably annexed to Gaó-gaó. "Those Kingdoms," continues Leo, (p. 12.) "are bordered on the South by Bito, Temiam, (Lemlam, or Yemyam?) Dauma, Medra, and Gorhan; their rulers and inhabitants are rich and pretty well acquainted with trade; among them justice is done, and there is a well-ordered Government; but the inhabitants of the other States are, in those matters, worse than beasts." Notwithstanding the frequent vicissitudes to which the extent, and consequently the name of Kingdoms and Empires must be subject among unlettered Savages, such as most of the Negro race have ever been, several of the States named by Leo may be said to exist at the present day; and most, if not all of them, were flourishing two Centuries earlier, as appears from Ibn Bátúta, who followed the course of the Niger for a considerable distance in the first half of the XIVth Century. Idrisí, who lived 150 years before Ibn Bátútah, has few names exactly corre-	NIGRI-TIA.

NIGRI-
TIA.

sponding with those given by the latter. Abú-l fedá, his contemporary, who relied principally upon the authority of Ibn Sa'id, knew nothing to the West of Ghánah, and he confounds the Niger with the Nile, of which he supposed it to be an arm, flowing into the Atlantic Ocean in 14° North and 10° 30' East, (about 4° West of Greenwich,) so that the Arabs appear at that period to have gained some confused notions of the course of the Senegal. It seems probable from a comparison of these conflicting accounts, that a great revolution had taken place on the banks of the Niger in the course of the XIIIth Century; and if some of the States previously independent, had been, in that interval, absorbed by their more powerful neighbours, a change in the name and relative position of the Sovereignities on or near that river, must necessarily have arisen, and the apparent discordance between the earlier and later Arabian writers will be satisfactorily explained. Leo himself observes, (p. 636.) that before the Berber Tribe of Lumtúnah was converted to the Mohammedan Faith, A. H. 380, (A. D. 990,) the Arabs had no intercourse with any Negro States except Wáhát (the Oases) and Kanó, and most of them were, according to him, at that time in the same condition as the petty Republics on the Rio Grande now are. They were, with few exceptions, idolaters, though the people of Gaógaó were Christians of the Jacobite sect, like their neighbours the Nubians. In either case they presented a legitimate object of attack to the Berber Chiefs, who were now bigoted Musulmáns; and their subjection was the more easily effected as they were unwarlike and disunited.

Arabian
conquests.

Abú Bekr ibn 'Omar seems to have been the first of the Almoravide (Morábit) Sovereigns of the West who made a considerable progress in the conquest of Nigritia, about A. H. 454; (A. D. 1062;) and his empire over the Negroes was enlarged by his successor Yúsuf ibn Táshifín, the greatest of the Moorish Sovereigns of Africa, whose dominions extended from the borders of Catalonia beyond the banks of the Niger. (Dombay, *Geschich.* p. 210. 214.) Both of them were Berbers of noble origin, descended from the Sanhájah and Lumtúnah Tribes; and the latter was the founder of Morocco. According to Marmol, (ix. l. tom. iii. f. xxi.) the conversion of the Negroes was begun by Hájin ibn 'Abdu-l malik in A. H. 469, (A. D. 1077,) and completed by Yahyá ibn 'Alí Abú Bekr: the Moorish Historians (Dombay, p. 173.) indeed affirm that the Berbers had made considerable incursions into Negroland two centuries earlier; but their accounts appear to be little better than vague traditions, and the first of the Lumtúnah Princes who bears a Mohammedan name, died in the middle of the IXth Century, which seems to mark the period when the Berbers embraced Islám. The Negroes on the Senegal were idolaters, when that river was discovered by the Portuguese in 1446, (De Barros, *Asia*, dec. i. lib. i. c. 13. i. 109.) and it was then, as now, the line of separation between the Senhájah Berbers (*os Mouros Azenegues*) and the Yalofs, the first Negroes of Guinea. (*Os primeiros Negros de Guiné chamados Jalofes.*) The Sahrá along the coast, (De Barros, dec. i. lib. i. c. 13. i. 109.) and the mountains between the valleys of the Senegal and Niger, continued, till a later period than the time of Leo, to present a barrier to the progress of the Arabs; for Marmol, who lived half a century later, thus fixes the boundaries of Nigritia: (lib. i. c. 15. i. fol. 15.) "The Land of the Blacks, which the Africans call Geneua, and Zinch, and Neuba, (Jenáwah,

VOL. XXV.

Zinj, and Núbah,) is that part which is also called, as we have already said, Beled ala Abid, (Beled al 'abid,) and the Lower Ethiopia included by Ptolemy in the Inner Lybia; which has the Ocean on the West, the Deserts of Zahara on the North, the Upper Ethiopia, which they call el Habexa, (el Habesh,) where the Kingdoms of the Abixinos (Abyssines) are, on the South; and Ethiopia above Egypt on the East." It is evident that Negroes from one side of the Peninsula to the other were included within these limits; but the Spaniards and Portuguese took Jenáwah* in a more extended sense than Leo; and confounding the Senegal with the Níl-el-'abíd, (Nile of the Slaves,) they transferred the name of Guinéa, (Jenáwah,) a Country on the banks of the latter, to the tract between the former and the Gambia, and subsequently to the whole of the Southern coast. Marmol, however, though he comprehended Senegambia and Zanguebar within the Land of the Blacks, retained the subdivisions of Leo.

Nigritia Proper, therefore, may be said to comprehend these States: 1. Walátah, the first place in Nigritia, 1. Gualata. Walét. is properly an Oasis in the Desert, 300 miles from Cape Nún, 500 miles from Tombuktú, and 100 miles in a straight line from the Ocean. (Leo, 638.) It contained only three villages though it had been the Royal residence when a Berber King was Sovereign of Tombuktú; in Leo's time, it was subject to the Negro Sovereign of that Country, who had supplanted the Berber dynasty. (637.†) Its inhabitants were properly a mixed race, and had adopted the Berber customs, particularly that of veiling their faces, (639. Lyon, p. 109.) while their women made no scruple to appear without veils, and performed their devotions together with the men. (Ibn Batútah, p. 42. Denham, p. 20.) They are called Benaí, says Marmol, (lib. ix. c. 22.) and speak the Sungaí Language, are very civil to strangers, but are very black, lazy, and ignorant; living in great indigence and misery. This place is called Eí Waláten‡ by Ibn Batútah, (p. 42.) and Walet in Major Rennell's Map attached to Hornemann's *Travels*. According to Ibn Batútah it is ten days (170 miles) journey from Tásehlá, and that place, another Oasis, is twenty days' journey (340 miles) from Teg- Tegazze. hazzá, celebrated for its salt-mines, and distant twenty-five days' journey (425 miles) from Sijilmásah; so that the whole distance from Sijilmásah, on the Southern declivity of Atlas, to Walátah, on the borders of El Súdán, is nearly 1000 miles. It must, however, be confessed that the distances given by Leo cannot easily be reconciled with the position of Aí Waláten according to Ibn Batútah; and it is very possible there may be more than one tract in the Sahrá bearing the same name.

2. "The next Negro State," says Leo, (639.) "is 2. Geneoa. Geneoa, (Jenáwah,) called by its inhabitants them- Genni. selves Genni, (Jenní,) and by the Portuguese and other Guinea. Europeans Ghinea; (*i. e.* Guinea, or Guiné, according to the Spanish and Portuguese orthography;) but it is separated from Walátah by a desert of 500 miles in extent. It has that Country on the North, Tombutto

* Jenáwah is pronounced Jenéwah, or Genéwah, by Moghrebine Arabs, whence the Guiné, or Guinéa, of the Portuguese, and the Geneua of Marmol, are immediately derived. Jinní, or Jenní, (on the Niger,) occurs in older writers instead of Jináwah.

† About A. D. 1500, says Marmol; (iii. fol. xxii.) but this seems to be merely a conjecture drawn from the less precise terms used by Leo. (639.)

‡ Not Abú Látin as the transcriber of one MS. has Arabized the name. (Lee's Translation of Ibn Batútah, p. 233.) Eí or Aí Waláten is probably a significant Berber word.

NIGRI-
TIA.

(Tombuktú) on the East, and Melle (Málí) on the South; and stretches for 250 miles along the River Niger, one part of it reaching the Ocean where that river runs into it." Here Leo confounds what he learned in Europe with the knowledge acquired in Africa, and, having forgotten the direction in which the Niger runs, he identifies it with the Senegal, falling into the error prevalent among Europeans. Thus Abraham Peritsol of Ferrera, who wrote in 1524, (*Itinera Mundi*, 243.) says distinctly that the latter is a branch of the Nile, which springs from the Mountains of the Moon; (p. 157.) and De Barros, after observing (i. 3. 8. tom. i. p. 213.) that the Sanagà receives different names in the different Countries through which it passes, being called Zimbalá in Bagano, and Isa in the Kingdom of Tungubutú, adds that it comes from the Eastern sources of the lakes called Chelonides by Ptholomeu. "Among the streams which fall into it," he afterwards says, (*Ibid.* p. 215.) "there is one which comes from the South, from the territories which the Negroes properly call Guiné, or Genny;" so that the true Niger was supposed by him to be one of the Southern tributaries to the Senegal. The "Niguer" (Nigir) of Ptolemy he supposed to be one of the principal sources of the Gambia; (*Ibid.* p. 216.) and Marmol, half a century later, affirms (i. 17.) that the Arabs* say that the Niger, which they call Hued Nijar, (Wád Nijár,) is a part of the Nile which runs under ground till it reaches the place where it forms the Lake Neuba, in the Desert of Cen, and thence running Westwards, forms another large lake called "Nigrite," whence it advances with many large windings, and increased by many tributaries, to the Western Ocean, dividing into two very large arms, called Zenegà and Gambia. The cause of this capital error respecting the great rivers of Central and Western Africa may be learned from another passage in Peritsol's *Itinera Mundi*. (cap. xix. p. 152.) "From Cape Cantín, (probably the Capo das Barbas of modern Maps,) the Caravans," he says, "go up through the middle of the Continent, through great Deserts, to another well-peopled place named O'dén, (Waddán,) from O'dén they go to Tégázzá, from Tégázzá to Tábút, and from Tábút to the great Kingdom of Mélé, which is destitute of salt. This is a journey of more than seventy days. The salt is carried on camels till they reach very high mountains, over which the salt is carried on men's heads with very great labour." The Jews, therefore, and other Europeans who went to Tombuktú, travelled with the caravans across the Deserts, taking in a cargo of salt at Tégázzá, for the purpose of exchanging it for gold and tropical produce in Málí, which, as will hereafter be shown, was South of the Niger. Jenní, according to Leo, (640.) "had neither city nor castles, and only one large village, the houses of which were no better than huts whitewashed and thatched with straw. The village, he adds, is like an island from July to September, during the three months of the Niger's inundation. Then it is that merchants come in canoes with goods from Tombuktú." Cotton cloths manufactured by the natives were exchanged with the Berber merchants for European cloths, copper, brass, arms, &c. The currency consisted in uncoined gold, and for trifling articles, bits

Jenny.

* Though the Arabs appear to have had some knowledge of Ptolemy's *Geography*, no Arabian writer, except Leo, has mentioned the Niger; and it is from him that Marmol borrowed what he here gives; not perhaps without some inclination to conceal the source from whence it came. It is very manifest that all his distances are merely a conversion of Leo's miles into leagues.

of iron* from a quarter of a pound to a pound in weight were used as coin. Though abounding in barley, rice, cotton, cattle, and fish, this Country produced no fruits, not even dates. The inhabitants were tolerably well dressed in black or blue cotton cloths, and in Leo's time were governed by a Viceroy appointed by Izkia, King of Tombuktú. Of Jenní, so well known in modern times, no mention is made by Ibn Batútah; but he might have crossed the Jálíabá above it, or, perhaps, it was not yet built; and as we have only an epitome of his narrative, no inference can be drawn with any certainty from his omissions.

3. Mélé, (Málí,) says Leo, (641.) "stretches along an arm of the Niger (the Sansarah of Ibn Batútah, p. 44?) for 300 miles, being bounded on the North by Jenní; on the South by the Desert and arid mountains; on the West by uncleared forests which extend to the Ocean; and on the East by the Principality of Gago." It is very productive of grain, cotton, and cattle, and has a very large village containing 6000 houses, which is the King's residence, and is much frequented by native and foreign artificers and traders. It has many Mosques, in which Lectures in Divinity are delivered, as there are no Colleges, and it was the first Negro State which embraced the Faith of Mohammed. It was at that time governed by an uncle of Joseph, (Yúsuf ibn Táshifín,) Sultán of Morocco; but afterwards, together with the neighbouring States, became tributary to Izkia. The distance between Aí-Weláten and Málí, according to Ibn Batútah, is twenty-four long days' journey, (about 600 miles.) Zágharí, where there are many Ebádí heretics, is 250 miles distant from the former, and from Kársakhú on the Níl, (Niger,) which runs thence with a bend to Kábarah, Zághah, &c. "Múli," he adds, (p. 45.) "is the last district in Málí." That Country was completely Mohammedan in his time, for he speaks with praise of its Kádí and other learned men, but complains of the penuriousness of its King Mansá Suleimán,† and of the servility of his subjects, who swear by his name, and cover their heads with dust or mud‡ when they approach his presence.

TIA.

Zaghari.

4. Of Tombuttú, (Tombuktú,) Leo says, that the name of the Kingdom is taken from its Capital, which was built in A. H. 610, (A. D. 1213,) about twelve miles from a branch of the Niger. A Mosque and the Royal Palace were the only buildings of stone. There were many shops of traders and manufacturers, especially of cotton-weavers; and the place was well supplied with goods from Europe by the Barbaresque merchants, some of whom were so rich, that two brothers among them were married to two of the King's daughters. The town was supplied with water by many springs, and, in the time of the inundation, by canals filled from the Niger. Grain, cattle, milk, and butter were abundant; but salt very scarce, being all brought from Tégázzá, 500 miles distant. The King possessed great wealth, had a splendid, well-regulated Court, great numbers of camels, and about 3000 cavalry. He was

4. Timbuc-
too.

* "In Obeid," (the Capital of Kordofán,) says Dr. Rüppell, (*Reisen*, p. 139.) "they use for small expenses, a peculiar kind of money; viz. small pieces of iron, three inches thick, in the form of a T."

† It is remarkable that this is the name and title of the Sultán who, according to Leo, (642.) founded Tombuktú, in A. H. 610, (A. D. 1213,) and Mandi Mansa is mentioned as King of Mandinga in 1534, by De Barros, (i. 258.) Mansa, signifying King in the Mandingan Language. (*African Lessons*, p. 14. Caillé, iii. 297.)

‡ See Clapperton's *Second Expedition*, p. 10. 47. 52.

NIGRI-
TIA.

also addressed with the same degrading ceremony of sprinkling dust upon the head, as the King of Málí. His almost countless infantry was armed with bows and poisoned arrows. No horses, except some small nags, were bred in the Country; all were imported from Barbary. Learning flourished, books were in great request, and the Sheikhs, Imáms, and Kádís were liberally remunerated; but Jews were prohibited from entering the Country. The natives, according to the genuine Negro character, often passed the night in going about the town with music and dancing. Their currency consisted of bits of pure gold, and certain shells brought from Persia,* 400 of which were exchanged for a ducat, and 6½ of those ducats were equal in value to a Roman ounce, (about three guineas.) There was neither a garden nor an orchard any where near the city. "The King of Tumbutó," says Marmol, (ix. 5.) "is now called the Emperor of Melli;" with the position and resources of which Country that writer was well acquainted, as he had accompanied the expedition under Mohammed, the first Sherif of Morocco, who, in or about A.D. 1550, marched as far as Sákiyah-el-hamrá, (Red Water-course,) in the Desert, on the confines of Tombuktú, with the intention of conquering it. Kábrah,† a large village-like town on the Niger, about twelve miles from Tombuktú, was the port to which the Negroes came in their boats, from all quarters, to meet the merchants going up to Guinea and Melli. (Jenní and Málí.) A Governor appointed by the King resided there, and acted as Kádí. Most of the provisions consumed in Tombuktú, came by the way of Kábrah; but it was a very unhealthy place, in consequence of the gross mixture of food used by the inhabitants. Marmol (ix. 7.) ascribes its unhealthiness, in addition to that cause, to the exhalations from the river, which, he says, here divides into the two branches forming the Zenegá and Gambea. For this he is not indebted to Leo; we now know that he was wrong in supposing these rivers to be arms of the Niger; but it is plain that he had heard of a division of that stream near Kábrah; and in supposing it to run Westward, he was supported by Leo, who had seen the stream. Ibn Batútah went from Málí to Tombuktú, and noticed the hippopotami on the bank of the river, (44.) or rather on a canal‡ from it. (Lee's Translation, p. 241.) Of the town, he only says that it was chiefly inhabited by merchants from Lithám, a Province of Málí, by whose Sultán the Governor of the place was appointed; and it was only four miles from the Nile, which is not at variance with Leo's account, if the cut or canal from the river by which Ibn Batútah approached Tombuktú be meant.

5. Gago.

5. "Gago," says Leo, (646.) "is the Capital of a Kingdom bearing the same name, near 400 miles South, or almost South-East of Tombuktú." It is un-walled, ill-built, and inhabited by merchants, who come to exchange their goods from Europe and Barbary for the gold brought by the Negroes, but there is always a larger demand than they can supply, and the Negroes are obliged to carry back one half or two-thirds of their gold for want of goods to purchase. This town was well supplied with water and all kinds of provisions, and had a large slave-market, where a boy or girl fifteen

years old was sold for six ducats, (about £3.) "Compared with others," says Leo, (647.) "this city is highly civilized." He then speaks of the King's harem, eunuchs, guards, palace, hall of audience, numerous ministers, officers and attendants, and large revenues. All foreign goods, he says, sold there for very high prices; horses, which in Europe were worth only ten ducats, (£5,) being purchased there for forty or fifty, and fine blue or scarlet Venetian cloths for fifteen ducats a yard. "Salt," he adds, "is the dearest of all the goods which are imported." The rest of the Country consisted in hamlets and villages inhabited by labourers and herdsmen, who went nearly naked in Summer, but were clad in sheepskins in Winter. The latter fact, if Leo can be trusted, shows that at some distance from the river this part of Africa must be mountainous and very elevated, for the level near the stream must evidently be lower than at Kábrah. The natives are represented as extremely ignorant, and reduced to great indigence by most oppressive taxes; "the King," says Leo, "treating them as they deserve;" a rather severe sentence to pass upon ignorance; but a reference to Leo's former (and perhaps actual) Faith, will account for this harsh judgment:—these Negroes were doubtless still Pagans,* and that is the reason why he considered their ignorance as deserving of such severity. If this place be the Gaúgaú of Ibn Batútah, as is most probable, it was on the banks of the Niger, and therefore not the Gaógaó of Leo, (658.) which lay to the East of Bornú. "From Gaúgaú,"† says Ibn Batútah, "the Nile (*i. e.* Niger) proceeds to the town of Múli, the last district in Málí, and from thence it passes on to Yuwí, the largest Country of the Blacks, of which the Sultán is the most powerful among the Negro Sultáns; and no white man is allowed by the people to enter it, for they kill him (on his way) before he reaches it." If in this passage we supposed Yuwí to have been put for Yaúrí, a conjecture authorized by the similarity of the Arabic letters *r* and *w*, we shall at once be able to account for the ignorance prevalent among the Arabs respecting the lower course of the Niger. Their progress was stopped by the power and hostility of the Kings of Yaúrí. Though acquainted with Gúber, and the Countries between it and Bornú, they did not reach the latter by the direct route across from Málí, but were obliged to make a circuit through the Desert.‡ In Bornú and its neighbourhood they found the Yeu and Shárl, the sources of which were unknown to them, they therefore concluded that they were a continuation of the Niger, just as, for the same reason, they supposed the Bahr-el-abyad, or Western branch of the Nile to be a part of the same

NIGRI-
TIA.

* Ajem, no doubt, in the original, for it signifies any Country out of Arabia; and the shells called wad'ah by the Arabs are the kaúris brought from India, and still current in Africa. (De Sacy, *Chrest. Arabi*, i. 253. Burckhardt, *Nubia*, 393. 471.)

† Also called Cadi by the natives. (Marmol, tom. iii. fol. 23.)

‡ Khalij, strangely rendered gulf by Professor Lee.

* Marmol (ix. 6.) says, on the contrary, that this very ignorance made them the more ready converts to the Arabian missionaries, who were contented if they did but profess their belief in Mohammed; but this is an addition of his own, and however the intolerance of the Mohammedans may have deteriorated the Negro character, it cannot be denied that they have introduced the art of writing and the use of books wherever they have established their Faith.

† Gaó-gaó, or Gaú-gaú, is manifestly the true mode of spelling this name; not only from the punctuation in the Camb. MSS. (Lee's Ibn Batútah, p. 237, note d,) but from Leo; the last *o* which sometimes occurs having been omitted as a Latin termination. The *g* is a letter much used in the Berber, and other African Languages, and the repetition of the same syllable is common in most barbarous, unpolished dialects, especially in those of Africa, as Wak-wak, Lem-lem, Yem-yem, Kisi-kisi, &c.

‡ In later times they have followed the Niger as far as Fendah, and travelled from thence to Kattagum, or Kottogom. V. Lyon's *Travels*, p. 148.

TIA.

river. Gaógaó was evidently the extremity of Ibn Batútah's journey Eastwards, for of Yuwí (Yaúrí?) he knew only by hearsay, and Leo expressly says, (649.) that Gúber was separated from Gaógaó by a desert 300 miles in extent, and 40 miles from the Niger; but we now know that the country between Gúber and that river is extremely fertile, while the distance in a straight line between them is more than 120 miles.

6. Goober.

6. Gúber,* says Leo, lying between high mountains, contains innumerable villages inhabited by shepherds and herdsmen. Its inhabitants are tolerably civilized, and many of them good workmen, excelling in the manufacture of cotton cloths and a kind of shoes, resembling those of the old Romans. The Country affords pasture for much cattle of a small breed, and the plains, which are covered with water during the inundations of the Niger, are very productive of rice, millet, and some kinds of grain not known in Italy. (*Dokhn* and *durrah*, species of *Sorghum*.) The largest town, where the King resided, contained 6000 families. This Country was subdued, its King put to death, and his sons made eunuchs, by Iskia, King of Tombuktú, under whose iron sway one half of the population was swept off, a vast multitude of them being sold as slaves. Unless we suppose that Gúber, in Leo's time, extended further than at present to the West and South, the river which he calls Niger must be the stream flowing by Sakatú; but whichever supposition be adopted, it is manifest that he either had never noted or had forgotten the direction in which those streams run.

7. Aghades.

7. Aghadés, (Aghadás,) the Capital of a Kingdom bearing the same name, was, according to Leo, (650.) on the borders of the Sahrá, and next to Walátah, the Negro State nearest to the land of the Whites. It was walled, and its houses were well built, as in Barbary; all its inhabitants, except the artificers and soldiers, being foreign merchants, who had a vast number of slaves, employed chiefly on the dangerous road between it and Kanó and Bornú, infested by Gypsies. The King was of Libyan (Berber) descent, had a strong guard, and a fine palace in the middle of the town: but he was liable to be deposed in order to please the inhabitants of the Sahrá, (the Tawárik,†) without however being put to death. He was subject to the King of Tombuktú, and paid him a tribute of 150,000 ducats, (about £75,000.) All the Southern part of his territory was inhabited by herdsmen, who lived in huts made of boughs or mats, like those of the Arabs. "This town was built,"‡ says Leo, "by the later Kings," and lies, says Marmol, (ix. 9. iii. f. xxv.) to the East of Gúber. He also adds that "in the Desert round this city a great quantity of manna is gathered, and kept by the inhabitants in calabashes (*calabaças*) for sale to the traders who come thither from other parts to buy it."

8. Cano.

8. Kanó is a large and populous Province, about 500 miles East of the Niger;§ some parts of it are mountainous and woody. It is well-watered, and its woods contain wild orange and lemon trees. The plains are very productive of corn, rice, and cotton; and the inhabitants of the villages are either herdsmen or labourers. In the middle of the Country is the Capital, bearing the same

name, and enclosed by a wall of stakes plastered with clay, of which its houses also are built. Zegzeg and Kas-sená (Kach'ná) were once subject to its King, but having been seduced from their allegiance by Iskia, he put them to death, and took possession of their territories, and three years afterwards compelled the King of Kanó to take one of his daughters in marriage, and pay him one-third of his revenues as a yearly tribute.

NIGRI-
TIA.

9. The Kingdom of Casená* (Kashná) joins Kanó on the East,† has many mountains and a rugged soil, but enough for the growth of barley and millet. Its inhabitants are extremely black, have very thick lips and noses, live in villages consisting of wretched huts, and never containing more than 300 families. Laziness and indigence are here united, and one-half of the inhabitants was swept away when Iskia made himself master of the Country.

10. Zegzeg,‡ lying to the South-East of Kanó, is about 150 miles distant from Cashná. One part of it is level and the other hilly; the former is very warm, but the latter is so cold, that in Winter they are obliged to warm their rooms by brasiers filled with lighted embers, which they place at night under their high bedsteads. The soil is well watered and fertile; the inhabitants great traders and very rich; and their King was an independent Chief, till overcome by Iskia, King of Tombuktú.

11. Zanfárah, to the East of Zegzeg, is a very productive Country, inhabited by many ill-disposed and rude Tribes. They are tall, excessively black, have broad, hideous faces, and are more like beasts than men. Iskia caused their King to be poisoned, and rooted out many of his subjects. Gúber, Kách'hná, Zekzek, and Zanfárah do not appear to have been known to the Arabs before the XVth Century.

12. Wangárah, (or rather Wankárah,) to the South-East of Zanfárah, was possessed by a numerous people, whose King had 7000 archers on foot and 500 foreign cavalry. He received large sums from the duties on imported goods. As their territory was bounded on the South by certain Countries rich in gold, the people of Wankárah acquired great wealth by trading in distant lands, till their trade was interrupted by two powerful and inveterate enemies, the King of Tombuktú on the West and the King of Bornú on the East. The road from Wankárah to the gold-tract lay over mountains too high and rugged to be crossed by beasts of burden, so that all the travellers' goods and provisions were carried in large dry calabashes on the heads of slaves, some of whom could travel thus 20 miles a day. The natives, however, are represented by Leo (654.) as having only one large village, and living in the ordinary Negro huts.

13. The Kingdom of Bornó,§ says the same writer, (655.) is an extensive territory, bounded on the West by Wankárah, and stretching about 500 miles Eastward; on the South it is contiguous to the Desert of Seu, and on the North to those opposite to Barkah. It is partly mountainous and partly level, but fertile and populous; inhabited by a civilized people,

* Or Gobur. (Marmol, ix. 8.)

† "By the Wánsikah (Guenziga) Tribe," says Marmol. (iii. fol. xxiv.)

‡ Marmol (ix. 9.) says, "160 years ago," i. e. in the first half of the XVth Century.

§ East of Agadés. (Marmol, ix. 15.)

* Pronounced Kach'hná by a native of Gúber.

† As we now know that the converse of this is true, it is manifest that Leo spoke either from memory or the report of others. Marmol is, as usual, merely his echo.

‡ Also called Zezac, says Marmol. (ix. 12.) It is properly spelled Zekzek, as appears from Maps drawn at Sakatú for Captain Claperton.

§ Or Burni. (Marmol, ix. 15.)

NIGRI-
TIA.

and much frequented by merchants. The mountains afford pasture for large flocks of goats, and are cultivated with barley and other kinds of grain. In Summer the inhabitants wear nothing but leathern trowsers; in Winter they are clad in sheepskins, which also serve for their beds. They have no Religion, but live like beasts, having wives and children in common. All their proper names are significant, and taken from some accidental peculiarity; thus, one is called "Tall," another "Short," a third "Squinter," &c. "This Kingdom," continues Leo, (656.) "is governed by a powerful Prince of the Libyan (Berber) Tribe of Bardoa, (Berdawah,) who has an army of 3000 horse, and as many foot as he chooses, being absolute master of his subjects. His revenue arises from a tithe of all the produce of the land and from plundering such of his neighbours as are at war with him; especially those beyond the Desert of Seù, who are very numerous, and used to ravage the whole of Bornò, till the present King caused horses to be imported by the merchants from Barbary. The merchants are obliged to wait two or three months till the King returns from his slaving excursions, being maintained at his expense in the interval, and then he pays from fifteen to twenty slaves for a horse. But if he be unsuccessful, they must wait till the next year, as such expeditions cannot be made without hazard more than once a year." Gold was then so abundant in Bornú, that the King's spurs, stirrups, bits, and curbs, as well as his dogs' chains, were all made of it; but slaves were still more plentiful, and he preferred giving them to gold in payment. Many Kingdoms of Whites as well as Blacks were subject to him. Thus it appears that the Berbers were masters of Bornú at the close of the XVth Century; and made annual ghaziehs, or slaving incursions into the territories of their Negro neighbours, at that time, nearly in the same manner as now. Leo, who had passed only one month in the Kingdom of Bornò, says (655.) that it is 150 miles distant from the source of the Niger, by which it is probable that he meant the Yeù, on the banks of which the former Capital of Bornú stood. "Before the Niger reaches Bornò," says Marmol, (ix. 15.) "it sinks under ground, and runs thus hidden more than eighteen leagues; and it afterwards rises again, and conveys to the sea its own waters and those intrusted to it by other rivers." This is an addition of his own, and little more than a repetition of what he had said at the beginning of his Work, (i. 17.) that the Nile, on rising again from the ground, under which it had flowed, forms the Lake Neuba in the Desert of Ceù, and runs thence Westward till it forms another great Lake called Nigrite. Thus the *Nuba Palus* and *Nigrites* of Ptolemy (iv. 6.) were confounded with the accounts given by the Arabs and the information derived from the Portuguese with the reports of the Arabs respecting the mouth of the Senegal, which appears to have been known to them so early as the XIIth Century. Idrisi says expressly, (*Geogr. Nub.* p. 7.) that the mouth of the Nile of the Negroes was one day's sail (about 80 miles) from the Island or Peninsula of Ulíl; and Al Bekrí, who lived nearly a century earlier, determines the place of this island, which he observes was surrounded by the sea only at high tides, by remarking that it was distant two months' journey along the shore from Cape Nú. (Quatremère, *Notice*, p. 202.) It must, therefore, be the Cabo Blanco of our

Source of
the Niger.

Maps, in 20° 50' North and 17° 6' West. Its distance from the mouth of the Senegal (nearly five degrees) does not agree with Idrisi's statement of one day and night's sail; but, in a region so imperfectly known, great errors must be expected; and there is no nearer point on the coast which at all corresponds with Al Bekrí's account.

14. "Gaógaó," says Leo, (658.) "is bounded on the West by Bornò, and on the East by the Kingdom of Nubia, (Núbah,) lying on the Nile; on the South by the Desert, which reaches a bend in that river; and on the North by the Desert of Sarta (Sidrah, or the *Syrtes*) and the boundaries of Egypt." It is entirely without civilization or government, and its inhabitants scarcely resemble rational beings; especially the mountaineers, who in Summer go almost naked, wearing nothing but a sort of leathern drawers. Their huts are made of boughs, and easily catch fire. They have many sheep and oxen, which they tend. They were entirely free, till reduced to subjection by one of their Countrymen, who was a slave to a rich merchant, and having murdered his master, got possession of great wealth, and gradually made himself master of the Country, about 100 years before the time of Leo, (*i. e.* about A. D. 1400.) This territory was then governed by one of this man's grandsons, named 'Omar, who had conciliated the good-will of the Sultán of Egypt by large presents, and maintained a commerce in arms, horses, and other goods with his subjects. The Egyptians, especially the Sherifs, (descendants of Mohammed,) and men of learning, were liberally entertained at his Court. "While I was there," says Leo, (660.) "a nobleman from Damiata presented to him a very fine horse, a Turkish sabre, a coat of mail, a musket, some fine mirrors, combs, strings of coral, and knives, which altogether might cost at Caïro 150 ducats; (£75;) and the King gave him, in return, 5 slaves, 5 camels, 500 ducats of this Country, and 100 fine elephants' teeth.

The 15th Kingdom of Nigritia, according to Leo and his transcriber Marmol, is Nubia; but, as the Núbahs are not Negroes, their Country cannot properly be included in Nigritia. The reader is, therefore, referred for an account of it to the head of NUBIA; and under that of SENEGAMBIA there will be found not only a description of the Country between the rivers from which that tract is named, but also a summary of the information respecting the remaining portions of Nigritia obtained since the time in which Marmol wrote, with a few hints as to the position of the Negro States not noticed by him, though mentioned by the earlier Arabian writers.

Type of the genus, *N. edulis*, Risso, *Crust. de Nice*, pl. iii. Inhabits the Mediterranean Sea.

NILIO, in *Zoology*, a genus of *Coleopterous* insects.

Generic character. *Antennæ* filiform, the articulations short, rounded-obconic, the terminal ones rather shorter and more rounded, subglobose, the second very short, third longer, the eleventh or terminal one scarcely longer than the tenth, globose-ovate; mandibles short, with the apex bidentate; *palpi* maxillary longer than the labial, with the terminal joint largest, subobtrigonal; *maxillæ* membranous, with two subequal laciniae, the exterior rather broadest, suboval, the internal elongate-quadrate, sublinear; body hemispheric; *thorax* very short, broad, immarginate, broadest behind, emarginate in front; *scutellum* distinct; *elytra* rather soft, gibbous, immarginate, on the sides flatly dilated; *tibiæ* slender, elongate, with the spurs very short, or nearly wanting; *tarsi* heteromorous, with the joints entire.

Type of the genus, *N. villosus*, Latreille, *Gen. Crust. et Ins.* vol. ii. p. 199. pl. x. fig. 2. The species all inhabit South America.

NILL, A. S. *nillan*, *nolle*, or *non velle*; compounded of *na*, not, and *will-an*, to will.

To will not, to be unwilling; to dissent, to deny, to refuse.

But whanne the word was herd that was seide Jhesus seyde to the prince of the synagogue *nyle* thou drede, oonli beleve thou.

Wiclif. *Mark*, ch. v.

Whoso that *n'ill* beware by other men,
By him shal other men corrected be.

Chaucer. *The Wif of Bathes Prologue*, v. 5762.

Wherefore in all thynges that reason is, in hym also is libertie of *willyng* and of *nillyng*.

Id. *Boecius*, book v.

So whan he seeth tyme at last,
That he may worche an other wo,
Shall no man tourne him therfro,
That hate *nylt* his felonie
Fulfil.

Gower. *Conf. Am.* book iii. p. 80.

Yet nothing could my fixed mind remove,
But, whether will'd or *nilled*, friend or foe,
I am resolv'd the utmost end to prove.

Spenser. *Fuerie Queene*, book iv. can. 7.

With my Sovereigne's leave,
I'll wed thee to this man, *will* he, *nill* he.
Beaumont and Fletcher. *The Maid of the Mill*, act v. sc. 1.

NIM, v. } Goth. and A. S. *niman*; D. and Ger.
NIMMER, } *nemen*; to take, to take away. See
NUM, and **NUMSKULL**.

To take, to take away, to deprive, to rob, to steal, to filch. It is still a common word among thieves.

So strejt he was, þat þey me ledde amydde weyes heye.
Seluer, þat non man ne dorste yt *nyme*. þey he yt seye.

R. Gloucester, p. 267.

In þe souþ syde of Temese nyne batayles he *nome*
Agen þe Deney's þe vorst ger of ys kynedom.

Id. p. 264.

He went his way, and with the coper he came,
And this chanon it in his hondes *name*
And of that coper weyed out an unce.

Chaucer. *The Chanones Yemannes Tale*, v. 16765.

But sith we arne to Fortune comen,
And hath our sermon of her *nomen*
A wonder will I tell thee now.

Id. *The Romant of the Rose*, p. 210.

So that anone by his aduise,
There was a priue counsaile *nome*,
The lordes ben to gether come.

Gower. *Conf. Am.* book iii. p. 86.

She fel, as she that was throug *nome*
Of loue, and so forth ouercome.

Id. *Ib.* book v.

For looking in their plate
He *nimmes* away their coyne.

Corbet. *Answer to the former Song*. By ——— Lakes.

A copper-plate with almanacs
Engrav'd upon't, with other knacks,
Of Booker's, Lyly's, Sarah Jimmer's
And blank-schemes, to discover *nimmers*.

Butler. *Hudibras*, part ii. can. 3.

NIMBLE, *adj.* } *Agilis*, says Skinner, "One
NIMBLENESS, } who can do any thing quickly and
NIMBLESS, } easily; from the verb, to *nim*:"
NIMBLY. } and Junius notices that *num-ol* is
capax, able to take or receive. See **NIM**, *ante*.

Active, agile, quick in motion or action; quick, speedy, alert.

Now the hande is the more *nymble* by the vse of some feates, and the legges and fete more swifte & sure by custome of goynge and rennyng.

Sir Thomas More. *Workes*, fol. 153. *A Dialogue concerning Heresies*, &c.

I grant, that in pregnancie of wit, *nimblenesse* of limmes, and politike inuentions, they generallie exceed vs.

Holinshed. *Description of Britain*, vol. i. ch. xx. p. 193.

He could his weapon shift from side to side,
From hand to hand, and with such *nimblenesse* sly
Could wield about, that, ere it were espide
The wicked stroke did wound his enemy
Behinde, beside, before, as he it list apply.

Spenser. *Fuerie Queene*, book v. can. 11.

But still the tyrant sternely at him layd,
And did his yron axe so *nimbly* wield,
That many wounds into his flesh it made,
And with his burdenous blowes him sore did ouerlade.

Id. *Ib.*

Sir Nicholas Bacon, when a certain *nimble-witted* councillor at the bar, who was forward to speak, did interrupt him often, said unto him; "There is a great difference betwixt you and me: a pain to me to speak, and a pain to you to hold your peace."

Bacon. *Works*, vol. i. p. 544. *Apothegms*, sec. 124.

Capacious Hell complains for want of room,
And seeks new plagues for multitudes to come,
Her *nimble* hands each fatal sister plies,
The sisters scarcely to the task suffice.

Rowe. *Lucan*, book iii.

Not of a *nimble* tongue, though now and then
Heard to articulate like other men:
No jester, and yet lively in discourse,
His phrase well chosen, clear, and full of force.

Cowper. *Tirocinium*.

Henry his sonne his pere was git ouer þe se.
Id. p. 133.

And aboute the *nynthe* our Jhesus criede with a greet vois and seide, Hely, Hely, lamasabatany, that is, my God, my God, whi hast thou forsaken me.
Wiclif. Matthew, ch. xxvii.

And aboute the *ninth* houre Jesus cried wyth a loude voyce, sayinge: Eli Eli lama sabathani. That is to say, My God, my God, why hast thou forsakē me.
Bible, Anno 1551.

Behind this God of Love vpon the grene,
I saw coming of ladies *ninetene*.
Chaucer. Prologue to the Legend of Good Women, p. 301.

Or at th' unhappy ways which let their cattle stray,
At *nine-holes* on the heath whilst they together play,
He never seems to smile.

Drayton. Poly-olbion, song 14.

NINEVE, (*Ninevé*, or *Nineveh*, i. e. the abode of Ninus, from נִינְוָה, Ninus, and נִינְוָה, abode,) probably called in very ancient time *Ninóh*, and thence by the Greeks *Ninos*, was the Metropolis of Assyria, on the Eastern bank of the Tigris, a little to the North of the modern city of *Músel*. Its founder was *Ashshúr*, either a Leader or a Tribe from the land of *Shin'ár*, (*Gen.* x. 11.) and its name was derived from *Ninus*, his son, its founder, according to *Diodorus Siculus*. (ii. 3.) It was of an oblong form, measuring 150 stadia (19 miles) one way, and 90 (11 miles) the other, having a circumference of 480 stadia, (60 miles,) and being the largest city ever built. Its walls were of a proportionate magnitude, 100 feet high, and broad enough for three chariots abreast. They were defended by 1500 towers, each of them 200 feet high. Though *Diodorus* has not named his authority for these extraordinary dimensions, their truth cannot be justly disputed, as we learn from one who visited it when in all its splendour, that "Nineveh was an exceeding great city of three days' journey;" (*Jonah*, iii. 3.) and *Strabo* says, (xvi. 1. 3. p. 737.) that it was much larger than *Babylon*. It is the first vast and powerful Capital of which we read, having been founded more than twenty centuries before the beginning of our Era, and almost 4000 years from the present time. It had already flourished for more than 1000 years, when the Prophet *Jonah* was sent to give a solemn warning of the impending calamities; and its ruin was averted by the timely repentance of its inhabitants, till it fell before the united armies of the Medes and Babylonians, 382 years afterwards, (B. C. 602,) as had been foretold by *Nahum* 150 years before. Its glory survived that of the Empire of which it was the metropolis, for only a very short time, (*Strabo*, xvi. 1. 3.) and twenty-four centuries have now passed away since its site has become "empty, void, and waste," and "the voice of its messengers has been no more heard." (*Nah.* ii. 10. 13.) Never has a prophecy been more completely fulfilled, even the bounda-

ries of its site are doubted; according to the Christians it **NINEVE**. extended from *Kádí-kend* to *Yárem-já*, about eight miles along the Eastern bank of the Tigris; the Jews insist on it, that it was three days' journey across. "Till near the river," says *Niebuhr*, (ii. 353.) "I was not aware that I had reached so remarkable a place. There, a village called *Núniyah*, on a considerable hill, was pointed out to me, as containing a Mosque, in which the Prophet *Jonas* was buried. It is a place of pilgrimage much frequented by Jews as well as Mohammedans." Another hill in the same district is called *Kal'ah Núniyah*, the Castle of *Nineveh*. The principal mounds which are thought to mark the site of the ancient *Nineveh*, are, according to Mr. *Buckingham*, (*Mesopotamia*, p. 299.) about three miles from the bridge over the Tigris at *Músel*,* beyond a small stream which falls into that river. "There are four of these mounds disposed in the form of a square; and these, as they show neither bricks, stones, nor other materials of building, but are in many places overgrown with grass, resemble the mounds left by entrenchments and fortifications of ancient Roman camps." The longest of these mounds runs nearly North and South, consists of several ridges, and appears to extend four or five miles. There are three other distinct mounds all running East and West near the river. The Southernmost is called *Nebí Yúnus*, (i. e. the Prophet *Jonas*,) from the tomb on its summit, round which there is a small village. The next, going Northwards, is called *Tel Hermush*, (the Hill of *Hermes*,) not distinguished by any thing remarkable. The third and Northernmost is the highest, and is called *Tel Núniyah*. From it the Southern extremity of *Músel* bears South South-West three miles. The Northern extremity West South-West two miles. The minaret of the Mosque of *Núr-ed-dín* South-West two miles. Village of *Nebí Yúnus*, South one mile. Centre of *Tel Hermush* South three-quarters, West half a mile. Both on the North and South of these mounds there is an appearance of similar elevations for several miles, and the intervening space is a level plain, every where covered with fragments of ancient pottery, ribbed and coarse. The river *Khaúsar*, a small stream from the Eastern mountains, runs into the Tigris near the foot of the *Tel Hermush*, which had been lately, but unsuccessfully, excavated in search of bricks, when Mr. *Buckingham* saw it in 1816; but in the *Tel Nebí Yúnus* a section of masonry was distinctly visible; the wall consisted of coarse sun-dried bricks, laid in beds of common mortar. The remains of *Nineve* are thus described by the late Mr. *Rich*, whose accuracy and fidelity are well known. Opposite to the town of *Músel* is an inclosure of a rectangular form, corresponding with the cardinal points of the compass, the Eastern and Western sides being the longest, the latter facing the river. This area may be supposed to answer to the Palace of *Nineveh*. The boundary may be perfectly traced all round, looks like an embankment of earth of small elevation, and has attached to it several mounds of greater size. On the first, which forms the South-Western angle, is the village of *Nebí Yúnus*, called *Núniyah* by *Niebuhr*; the next mound, and the largest of all, is near the centre of the Western face; it is called *Kóyunjuk depeh*, (Lamb's hill,) and has the form of a truncated pyramid. It consists of stones and earth, and at its North-Eastern extremity is the village of

* This stream does not appear in *Niebuhr's* plan of *Musel* and *Nineve*, tom. ii. tab. xlvii.

NINEVE. Kóyunjuk. Its greatest height is 178 feet, its length at the summit 1850, and its breadth from North to South 1147. Out of one of the mounds on the Northern face of the boundary there was dug, a short time before Mr. Rich saw it, a large sculptured block covered with figures of men and animals; it was split by the people who found it into small pieces, and used in building. "Cylinders like those of Babylon are sometimes found here," says Mr. Rich, (p. 39.) "but I have never seen nor heard of inscriptions. At this day," he adds, (p. 40.) "stones of very large dimensions are found in or at the foot of the mound which forms the boundary." At a subsequent period that zealous inquirer received a very fine brick with a varnished surface, and an inscription in very minute cuneiform characters from the ruins of Nineve. (p. 55.) One of the sculptured cylinders, also, (No. 11.) of which he has given an engraving, was found in that place.

NINNY, } Sp. *ninno*, *infans*; It. *nencio*,
NINNY-HAMMER, } or *nescio*, a fool, an idiot, a na-
NI'ZZY. } tural, a dolt; one that knows
nothing, ignorant. Florio.

A silly, simple fellow, a simpleton.

ARIEL. Thou liest, thou canst not.
CAL. What a py'de *ninnie's* this.

Shakspeare. *Tempest*, fol. 12.

You silly, awkward, ill-bred, country-sow, (quoth one,) have you no more manners than to rail at Hocus, that saved the clod-pated, numskull'd, *ninny-hammer* of yours from ruin, and all his family?

Swift. *Works*, vol. v. p. 21. *History of John Bull*, ch. xii.

Some say, compar'd to Bononcini,
That Mynheer Handel's but a *ninny*.

Byrom. *Epigram on the Feuds between H. and B.*

NIOTA, in *Botany*, a genus of the class *Octandria*, order *Monogynia*. Generic character; calyx four-cleft; corolla, petals four or five; anthers arrow-shaped; stigma acute; capsule woody, one-seeded.

Two species, trees, natives of the East Indies.

NIP, v. } Dutch *niipen*, *kniipen*; Ger. *kneipen*,
NIP, n. } *kneiffen*; Sw. *nypa*, *niupa*, *comprimere*,
NI'PPER, } *constringere*. Junius (in *Gloss. Goth.*
NI'PPINGLY, } p. 116.) observes that the Goth. *ga-nip-*
NI'PPLE. } *nands*, *contristatus*, seems to belong to
some old verb, corresponding with the D. *niipen*, or
English *nip*; and in A. S. the diminutive *nypele*, a
nipple, shows the word to have existed in that Language
also.

To pinch or press off sharply; to pinch, (sc. with the teeth,) and, consequentially, to bite; to pinch off, (sc. the germ or bud,) and hence, to blight, to perish; met. to bite, to pinch, to hurt, to injure; (sc. by censure, rebuke, or sarcasm;) to reprehend, to satirize.

Then awaked Wrathe. whit to white eyen,
Whit a nyvilynge nose. *nipping* his lippes.
Piers Plouhman. *Vision*, p. 92.

He that *nyppeth* a mannes eye, bryngeth forth teares.
Bible, Anno 1551. *Jesus Syrach*, ch. xxii.

This was no great curious sermon, but this was a *nipping* sermon, a pinching sermon, a byting sermon, it had a full bite, it was a *nipping* sermon, a rough sermon, and a sharpe biting sermon.

Latimer. *Sermons*, p. 101.

Now when our Saviour had told the disciples of John his workes and miracles which he did, he addeth a pretty clause, and giveth them a good privie *nippe*, saying, And blessed is he that is not offended by me.
Latimer. *Sermons*, p. 261.

Ready backbiters, sore *nippers*, and spiteful reporters, privily of good men.
Ascham.

For in skorne what could haue been spoken more *nippingly*, and therewith all more properly, than where the blessed apostle merily tauted the Corinthians, desiring them to pardon him, because he had put none of them to cost and charge.
Sir Thomas More. *Workes*, fol. 1374. *A Treatise vpon the Passion*.

ORIA. I doe confess I'm too easie, too much woman,
Not coy enough to take affection;
Yet I can frown and *nip* a passion,
Even in the bud.

Beaumont and Fletcher. *The Woman Hater*, act iii. sc. 1.

As his foe went then suffis'd away,
Thoas Ætoliu threw a dart, that did his pile convey
Above his *nipple*, through his lungs.

Chapman. *Homer. Iliad*, book iv. fol. 62.

God's prescription is, that we bestir ourselves betimes, that we *nip* sin when it begins to bud in the thoughts, and to crop it off as soon as it shoots forth in the desires.

South. *Sermons*, vol. vi. p. 157.

When *nipping* Eurus, with the brutal force
Of Boreas, join'd in ruffian league, assail
Your ripen'd hop-grounds.

Grainger. *The Sugar Cane*, book ii. l. 198.

NIPA, in *Botany*, a genus of the class *Monoecia*, order *Monadelphia*, natural order *Palmæ*. Generic character: male flower, calyx none; corolla, petals six; one filament, twelve-cleft; female flower, stigma with a lateral furrow; drupe angular, one-seeded.

One species, *N. fruticans*, a palm, native of the East Indies.

NIRMUS, in *Zoology*, a genus of *Apterous* insects.

Generic character. *Antennæ* five-jointed, filiform, similar in both sexes, rarely stouter in the males, and in some cases a little pectinated; body equally narrow; head of moderate size, with the sides rounded, or unangular anteriorly; *abdomen* with the last segment entire and rounded in the males; *tarsi* curved, triarticulate, with two contiguous, parallel, bent claws.

Type of the genus, *N. discocephalus*, Nitzsch. See Albin, pl. xlv. fig. sup. A numerous genus living upon birds of all orders; about fourteen species have been detected in Britain.

NIS, i. e. *Ne is*, or is not.

In his bed ther draweth him no day,
That he *n'is* clad and redy for to ride
With hunte and horne, and houndes him beside.
Chaucer. *The Knightes Tale*, v. 1679.

Leave me those hilles where harbrough *nis* to see,
Nor holy-bush, nor brere, nor winding ditch.
Spenser. *Shepherd's Calendar*. June, v. 19.

NISSOLIA, in *Botany*, a genus of the class *Diadelphia*, order *Decandria*, natural order *Leguminosæ*. Generic character: calyx five-toothed; joints of the pod one-seeded, pod ending in a strap-shaped wing, coriaceous; seeds many, the embryo curved.

Two species, *N. arborea*, a tree, and *N. fruticosa*, a shrub, both natives of the woods of Carthage.

NIST, i. e. *ne wist*, or *wist not*, knew not.

For veray wo cut of his wit he braide,
He *n'iste* what to speake but thus he saide.
Chaucer. *The Frankeleines Tale*, v. 13340.

NIST
NITIDU-
LA.

Methought he lough, and told my name,
Which was to me maruaile, and fere,
That what to doe I *nist* there,
Ne whether was me bet or none,
There to abide, or thus begone.
Chaucer. Dream, p. 385.

The sea on beat on euery side,
Thei *nisten* what fortune abide,
But sette hem well in God's will,
Where he hem wolde saue or spill.
Gower. Conf. Am. book iii. p. 80.

NIT, } A. S. *hnitu*; D. *nete*; Ger. *nisse*; Sw.
NITTY. } *gnat*. In *Exodus*, ch. viii. ver. 16, the A. S.
is *gnættas*; (*gnats*;) Lat. version *ciniphes*; our version
lice. See GNAT. Skinner would derive from Gr. *νυσσ-*
ειν, to prick, to penetrate.

The head many times is pestered with *nits*; but for to rid them
away, there is no better thing than dog's grease.

Holland. Plinie, vol. ii. p. 365.

I'll know the poor, egregious *nitty* rascal.

Ben Jonson. Poetaster.

Horses which go abroad, and are seldom dressed, are somewhat
discoloured by the numerous *nits* adhering to their hair.
*Derham. Physico-Theology, book iv. ch. xxiv. p. 249. note *.*

NITELA, in Zoology, a genus of *Hymenopterous*
insects.

Generic character. *Antennæ* seated on the sides of
the clypeus, near its anterior margin, with the second,
third, and following joints subequal; eyes lateral, oval,
entire; mandibles bidentate at the apex; *palpi* maxil-
lary, with the second joint thicker than the rest, the
fourth long, the two last short; *labium* subcordate,
emarginate; *clypeus* short, transverse; *abdomen* ovate-
conic; wings four, anterior with a subappendiculate mar-
ginal areolet; *tibiæ* smooth; *tarsi* with short claws and
pulvilli.

Type of the genus, *N. Spinolæ*, Latreille, *Gen. et*
Crust. pl. iv. fig. 77. One species, a native of Southern
France.

NITENCY, Lat. *nitens*, from *niti*, to strive, to en-
deavour.

Endeavour, effort.

For the atoms of fire flowing in, in great numbers, and passing
through with a very rapid motion, must needs accelerate the motion
of these particles, from which acceleration their spring, or endeavour
outward, will be augmented; that is, those zones will have a strong
nitency to fly wider open.

Boyle. Works, vol. i. p. 179. Of Rarefaction.

NITIDULA, in Zoology, a genus of *Coleopterous*
insects.

Generic character. *Antennæ* very short, the basal
joint orbicular, dilated, the third longer than the
fourth, the apex terminating in a large, abrupt, broad,
coarctate, perfoliated, three-jointed club; *palpi* nearly
equal, short, filiform; head small, inserted up to the
eyes in the *thorax*, the latter more or less emarginate
on its anterior edge, the sides depressed, deeply mar-
gined; *elytra* broad, entire, rarely truncate, subovate,
glabrous, deeply margined, and in general connecting
the extremity of the abdomen; body ovate, or elliptic,
broad, obtuse, somewhat depressed; legs short; *tibiæ*
broad, the anterior elongate-triangular; *tarsi* pentame-
rous, with the third joint dilated and bifid, the follow-
ing minute, indistinct.

Type of the genus *N. grisea*, Linnæus. Curtis,
Linnæan Transactions, vol. ii. p. 86. pl. v. fig. 6—11.
A very numerous genus, of which twenty-five species in-
habit Britain; they frequent putrid animal and vege-
table substances, old bones, &c., and some few delight
in flowers.

VOL. XXV.

NITRARIA, in Botany, a genus of the class *Dode-*
candria, order *Monogynia*. Generic character: calyx,
five-cleft, persisting; corolla, petals five, arched at the
apex; stamens fifteen; seed-vessel a one-seeded drupe.

Three species, natives of Europe and Africa.

NITRE, } Fr. *nitre*; It. *nitro*; Lat. *nitrum*;
NITROUS, } Gr. *νίτρον*. Cotgrave describes it as
NITRY. } A salt-resembling substance, of colour
light-ruddy or white, and full of holes like a sponge.

The trivial name of the Nitrate of potash. See the
Essay on CHEMISTRY, § 102.

As for waters and fountains of *nitre*, there bee ynow of them in
many places, howbeit, the same have no astringent vertue at all.
But the best *nitre* is found about Clytae in the marches of Mace-
donie, where there is most plentie thereof.

Holland. Plinie, book xxxi. ch. x.

But admirable is the nature of the lake Ascanius, and of certain
fountains about Chalcis, where the water above, and which floteth
uppermost, is fresh and potable; but all beneath and under it to-
ward the bottome is *nitrous*.

Id. Ib.

Observe how prudent Nature's icy hoard,
With all her *nitrous* stores would be devour'd.

Blackmore. Creation, book iii.

Winter my theme confines; whose *nitry* wind
Shall crust the slabby mire, and kennels bind.

Gay. Trivia, book ii. v. 320.

Forth from whose *nitrous* caverns issuing rise

Pure liquid fountains of tempestuous fire,

And veil in ruddy mists the noon-day skies,

While wrapt in smoke the eddying flames aspire.

West. Pythian Odes. Decade 1.

NIVEOUS, Lat. *niveus*, from *nix*, *nivis*, snow.

Snowy.

So cinabar becomes red by the acide exhalation of sulphur,
which otherwise presents a pure and *niveous* white.

Sir Thomas Brown. Vulgar Errours, book vi. ch. xii.

NIZZY. See NINNY.

NO, *adj.* } A. S. *na*; D. *neen*; Ger. *nein*. Tooke
No, *adv.* } observes that the Dan. *nôdig*, Swed.
Nor, } *noodig*, and Dutch *noode*, *node*, *no*, mean,
Not. } averse, unwilling.

No, adv. is used to express negation or denial, refusal,
rejection:—aversion, unwillingness.

No, the adj. to express the absence, negation or pri-
vation of any thing.

Nor, Skinner compounds of *ne*, and *or*. *Ne* and *no*
are used alone equivalent to *nor*. See the Quotation
from R. Brunne, and Wiclif, *Matt.* ch. vi.

Not, also written *nouht*, *noht*, *nat*, may be a corrup-
tion of *nought*, *q. v.*

No is usually written in Composition with body,
thing, where, wise, in old writers with *more*, as no more,
&c. &c.

That by my trouth I knew him *nought*.
So ferre it was out of my thought,
Right as it had neuer be.
Gower. Conf. Am. book viii. p. 372.
- What then? are we more excellent? *No*, in *no* wise; for we
haue already proued, that all, bothe Jews and Gentiles, are vnder
sinne.
Geneva Bible, Anno 1561. Romaines, ch. iii. v. 9.
- And whosoever shall give to drink unto one of these little ones,
a cup of cold water onely, in the name of a disciple, verily I say
unto you, he shall in *no* wise lose his reward.
Bible. Modern Version. Matthew, ch. x. v. 42.
- And he answered: to seke the asses, and whē we saw that they
were *no* where, we wēt to Samuel.
Bible, Anno 1551. 1 Samuel, ch. x. fol. 34.
- Should God create another Eve, and I
Another rib afford, yet loss of thee
Would never from my heart, *no* no I feel
The link of nature draw me.
Milton. Paradise Lost, book ix. l. 913.
- Whose lofty trees yclad with sommer's pride
Did spread so broad that heaven's light did hide,
Not perceable with power of any starr.
Spenser. Faerie Queene, book i. can. 1.
- For if from the beginning, the beeing of the creature had beene
attended with dayly losse of entity and perfections, how hath it
escaped *not-beeing* or annihilation.
Hakewill. Advertisements, sig. Bbb.

- NO'BLE, *adj.* } Fr. *noble*; It. *nobile*; Sp. *no-*
NO'BLE, *n.* } *ble*; Lat. *nobilis*; so called a *no-*
NO'BLE, *v.* } *minis claritate*, from the lustre or
NO'BLESS, } brightness of the name.
NO'BLENESS, } Renowned, famous; illustrious,
NO'BLY, } splendid; extolled, exalted, raised,
NOBILITY, } elevated; grand or aggrandized;
NOBILITA'TION, } dignified, glorious, magnificent.
NO'BLEMAN. } See to ENNOBLE, which is now
used instead of Surrey and Chaucer's verb, to *noble*.
- Noble*, the coin, so called from the purity and excel-
lency of the gold of which it was coined: *ex auro*
nobilissimo unde nobilis vocatus. Vossius *de Vitiis*,
lib. iii. c. 12. See the *Essay on NUMISMATICS*.
- Ych wol þe marie wel with þe þridde part of my londe.
To þe *noblest* bacheler, þat þyn herte wol to stonde.
R. Gloucester, p. 30.
- Vorto telle al þe *noblye* þat þer was y do,
þey my tonge where of stel, me ssolde nogt dure þerto.
Id. p. 191.
- And let þe bodyes of ys men, þat aslawe were
Gadery out and burye *noblyche* ynou þere.
Id. p. 219.
- þer wende þe duc Geffray & þe erl Baldwyne þere,
& þe oþer Baldwyne al so, þat *noblemen* were.
Id. p. 393.
- & with grete *noblay* tille London him led.
R. Brunne, p. 88.
- Roberd of Thornham bare him *nobilly*,
Bi þe side he nam, & wan it þer maisterie.
Id. p. 164.
- Thou humble and high over everye creature
Thou *nobledest* so fer forth our nature.
Chaucer. The Second Nonnes Tale, v. 15508.
- Gerveis answered; "Certis were it gold,
Or in a poke *nobles* all untold
Thou shuldest it have, as I am a true smith."
Id. The Reves Tale, v. 3778.
- But there may no man, as men may wel see,
Bequethe his eyre his virtues *noblenesse*.
Id. Certaine Ballades, p. 403.
- "Grisild," (quod he) "that day
That I you toke out your poure array,
And put you in estat of high *noblesse*,
Ye han it not forgotten, as I gesse."
Id. The Clerkes Tale, v. 8344.
- That ye so longe of your benigneite
Han holden me in honour and *nobly*.
Id. Ib. v. 8704.
- His pacience, and his simplese
Hath set hym in to high *noblesse*.
Thus was he pope canonised
With great honour and entronised.
Gower. Conf. Am. book ii. p. 66.
- Sinon a wretche she can not make him false.
If euer came vnto your eares the name,
Nobled by fame, of the sage Palamede,
Whom traiterously the Greekes condemned to dye.
Surrey. Virgil. Eneis, book ii.
- As for *nobilitie* in particular persons; it is a reverend thing to
see an ancient castle or building not in decay; or to see a faire
timber tree, sound and perfect: how much more to behold an
ancient *noble* family which hath stood against the waves and
weathers of time.
Bacon. Essay 14.
- Ros. The commons hath he pil'd with grievous taxes
And quite lost their hearts: the *nobles* hath he finde
For ancient quarrels, and quite lost their heartes.
Shakspeare. Richard II. fol. 30.
- Both the prerogatives and rights of the divine majesty are con-
cerned, and also the perfection, *nobilitation* and salvation of the
souls of men.
More. Antidote against Idolatry, ch. ii.

NOBLE.
—
NOCENT.

It most behoves the honourable race
Of mightie peeres true wisdom to sustaine,
And with their noble countenance to grace
The learned forheads, without gifts or gaine:
Or rather learn'd themselves behoves to bee;
That is the girlond of nobilitie.

Spenser. *The Teares of the Muses.*

The king of noblesse gaue charge vnto the friers of Leicester
to see an honourable interment to be giuen to it.

Bacon. *King Henry VII.* fol. 3.

Would God, that any in this noble presense
Were enough noble, to be vpright judge
Of noble Richard: then true noblesse would
Learne him forbearance from so foul a wrong.

Shakspeare. *Richard II.* fol. 39.

But thou whose noblesse keeps one stature still
And one true posture, though besieged with ill
Of what ambition, faction, pride can raise.

Johnson. *Epigram* 102.

Pride, hautinesse, opinion, and disdaine:
The least of which, haunting a nobleman,
Loseth men's hearts, and leaues behind a stayne
Vpon the beautie of all parts besides,
Beguiling them of commendation.

Shakspeare. *Henry IV. First Part*, fol. 61.

Behold

Whereon the Ægean shore a city stands
Built nobly, pure the air, and light the soil,
Athens the eye of Greece, mother of arts
And eloquence, native to famous wits.

Milton. *Paradise Regained*, book iv. l. 336.

Know this, my lord, nobility of blood
Is but a glittering and fallacious good:
The nobleman is he whose noble mind
Is fill'd with inborn worth unborrow'd from his kind.

Dryden. *The Wife of Bath's Tale.*

He therefore that thinks he shews any noblenes, or height of
mind, by a scurrilous reply to a scurrilous provocation, measures
himself by a false standard, and acts not the spirit of a man, but
the spleen of a wasp.

South. *Sermons*, vol. viii. p. 202.

Say, what's nobility, ye gilded train!
Does nature give it, or can guilt sustain?
Blooms the form fairer, if the birth be high?
Or takes the vital stream a richer dye?

P. Whitehead. *Honour*, (1747.)

NOCCA, in *Botany*, a genus of the class *Syngenesia*,
order *Segregata*. Generic character: common calyx,
six to eight parted; partial calyx five-cleft; corolla tu-
bular, hermaphrodite; hollows of the receptacle ciliated.

One species, *N. rigida*, native of Spain.

NO'CENT, *adj.* } It. *nocente*; Lat. *nocens*; from
NO'CENT, *n.* } *nocere*, to hurt or harm. See IN-
NO'CIVE. } NOCENT.

Doing hurt or harm, mischief or injury, hurtful,
harmful, mischievous, injurious.

Nocent, not Innocent he is that seeketh to deface,
By word the thing, that he by deed had taught men to imbrace.

Fox. *Martyrs*, fol. 231. col. 2.

To this question Garnet advisedly and resolvedly answered, That
if the advantage were greater to the Catholic part, by taking away
some innocents together with many nocents, then doubtless it should
be lawful to kill and destroy them all.

State Trials, 4 James I. Anno 1606. *The Gunpowder Plot.*

ROCHESTER. Oh gentle M. Langdale, you ought not to reason
after such a sort as you doe now, because that a trope or figurative
speech is *noctive* somewhere, but not euery where, nor in this
matter.

Fox. *Martyrs*, fol. 1255. *Disputation about the Sacrament.*

For all these ioyful *nocumetes* are the holy frutes of the whore-
dome of that holy whorish church.

Bale. *Image*, part ii. seg. R. iiiii.

The earle of Deuonshire, being interested in the blood of Yorke
that was rather feared then nocent.

Bacon. *King Henry VII.* fol. 213.

Him (the serpent) fast sleeping soon he found
In labyrinth of many a round self-rowl'd,
His head the midst, well stor'd with suttile wiles:
Not yet in horrid shade or dismal den
Nor nocent yet: but on the grassie herb
Fearless unfear'd he slept.

Milton. *Paradise Lost*, book ix. v. 186.

Surely it argues the value, that the very heathen put upon their
chastity, when the very design against it, was thought fit to be pre-
vented by the death of the innocent, and to be revenged upon the
nocent, even to the subversion of a government.

South. *Sermons*, vol. x. p. 241.

Whilst the warm limbec draws
Salubrious waters from the nocent brood.

J. Philips. *Cider*, book i.

NOCK, to *nick* or *notch*, to make an incision, or cut
into: to place (*sc.*) the shaft or arrow upon the *notch*.

Anus dicitur nock, quasi incisura. Skinner.

And ten brode arrowes held he there,
Of which five in his honde were,
But they were shaven well and dight,
Nocked and feathered aright.

Chaucer. *The Romant of the Rose*, p. 178.

The fight is fearful; for stout Burbon brings
His fresher forces on with such a shock
That they were like to cut the archers' strings,
Ere they their arrows handsomely could nock.

Drayton. *The Battle of Agincourt.*

The *nocke* of the shaft is diversely made for some be great and
full, some handsome and little; some wyde, some narowe, some
deep.

Ascham. *Works*, fol. 144. *Taxophilus.*

And thus have you hearde what wode, what fashion, what *knock-
inge*, what peeing, a steel must have.

Id. *ib.* fol. 145.

Then tooke he (Pandarus) up his bow,
And nockt his shaft, the ground whence all their future grieffe did
grow.

Chapman. *Homer. Iliad*, book iv.

Noses, which
Wou'd last as long as parent breech;
But when the date of *nock* was out,
Off dropt the sympathetick snout.

Butler. *Hudibras*, book i. ch. i. v. 285.

NOCTAMBULO, one who walks (*ambulat*) in the
night, (*nocte*;) and, consequently, a sleep-walker.

Respiration being carried on in sleep, is no argument against its
being voluntary. What shall we say of *noctambulos*?

Arbuthnot. *On Air.*

NOCTILIO, from the Latin *nox*, night. Lin. Illig.
Geoffr. *Noctilion*. In *Zoology*, a genus of animals
belonging to the family *Cheiroptera*, order *Sarcophaga*,
class *Mammalia*.

Generic character. Incisive teeth, above four, of
which the middle two large and conical, the lateral
small and tubercular, below two minute and bifid;
cuspid long and conical; molar pointed, four on a side
in the upper, and five in the lower jaw; snout short,
expanded, and cleft, covered with little warty or fleshy
tubercles; nose confounded with upper lip, nostrils
slightly tubular, approximated, and prominent; ears
small and lateral; interfemoral membrane very large
and projecting; tail of moderate length mostly included
in the membrane; claws of hind legs very strong.

The Bats, of which this genus is composed, are very
remarkable for the cleft in the upper lip, which from its
resemblance to that of Hares has given rise to the
name of *Hare-lipp'd Bats*, sometimes applied to them.
Cuvier and Temminck include them all in a single
species, considering those described as distinct species,
to be merely variations of size from age; but Geoffroy
makes three species.

NOCENT.
—
NOCTI-
LIO.

NOC-
TILIO.
—
NOD.

N. Americanus, Lin.; *N. Unicolor*, Geoffr; *American Noctilion*. As large as a moderate-sized cat, extent of wings two feet five inches, and of a lighter shade than the other parts which are of an iron-grey colour. From Peru and the Mosquito shore.

See Linnæi *Systema Naturæ*; Illiger, *Prodromus Mammalium*; Pennant, *History of Quadrupeds*.

NOCTILUCOUS, Lat. *nox*, the night, and *lucere*, to shine.

Shining by night. Pennant (*Zoology*; in the margin) calls the Nereis, *noctilucent*.

This appearance was occasioned by myriads of *noctilucent* Nereids that inhabit the ocean, and on every agitation become at certain times apparent, and often remain sticking to the oars; and, like glow-worms, give a fine light. Pennant.

NOCTIVAGATION, Lat. *nox*, the night, and *vagari*, to wander.

Wandering by night.

The townsmen acknowledge 6s. 8d. to be paid for *noctivagation*.
A Wood. Life of Himself, p. 274.

NOCTURN, *n.* } Fr. *nocturne*; It. *notturno*;
NOCTURNAL, *adj.* } Lat. *nocturnus*, from *nox*, the
NOCTURNAL, *n.* } night; and this from *νεύειν*, in-
NOCTUARY. } clinare, declinare, to bend or bow

down, to go down. See NIGHT.

Nightly, by, or in the, night, or night-time.

Noctuary, an account of what passes in the night.

Nocturns, prayers at night. That Monastic Watch contained between the hours of twelve and three A. M. *Officium horæ nocturnæ*, or *officium matutinum vespertinum*.

Having neither health, nor leisure, nor convenience, for the making of *nocturnal*, and other celestial observations; I have taken the greater part, from the best astronomers of the present age.

Grew. *Cosmo Sacra. Preface*, sig. A 2.

Then feed on thoughts, that voluntarie move
Harmonious numbers; as the wakeful bird
Sings darkling, and in shadiest covert hid
Tunes her *nocturnal* note.

Milton. *Paradise Lost*, book iii. l. 40.

I have got a parcel of visions and other miscellanies in my *noctuary*, which I shall send to enrich your paper with on proper occasions.
Spectator, No. 586.

The reliques being conveniently placed before the church door, the vigils are to be celebrated that night before them, and the *nocturn* and the matins for the honour of the saints, whose the reliques are.
Stillington.

Such were the pleasing triumphs of the sky,
For James's late *nocturnal* victory.

Dryden. *The Hind and the Panther*, part ii.

— The broad expanse of heav'n
Their canopy; the ground, of damp malign,
Their bed *nocturnal*.

Harte. *Psalm 8*.

The most usual way, therefore, of finding the hour of the night by the stars, whether they are on the meridian or not, is by making use of a large globe, or the instrument called a *nocturnal*, wherein the most remarkable stars are fixed in their proper degrees of declination and right ascension.

Watts. *Works*, vol. v. p. 448. *Of Geography and Astronomy*, sec. 20.

NOD, *v.* } Skinner, from the Lat. *nutus*, and
NOD, *n.* } that from *νεύειν*, to bend down. "The
NODDEN, } past tense of the A. S. verb, *hnig-an*, to
NODDER. } bend, is *hnah*, which by the addition of
the participial termination *ed*, forms *nahed*, *nah'd*, *nad*,
(a broad,) *nod*." Tooke, vol. ii. p. 198.

To bend down, to incline, to decline; to bend or drop down; *sc.* the head, as one drowsy or sleepy.

Another man might make a shift to wear
Rich clothes, sit in a chair of state, and *nod*.

Beaumont and Fletcher. *The Coronation*, act iii. sc. 1.

So have I often, when I would not drink,
Sate down as one asleep, and faign'd to wink
Till, as I *nodding* sate, and took no heed
I have at last false fast asleep indeed.

Beaumont. *The Remedy of Love*.

Care, care, and early rising; commonwealth's men
Are ever subject to the *nods*; sit down, Sir,
A short nap is not much amiss.

Beaumont and Fletcher. *The Little Thief*, act iv. sc. 1.

We have also shown, that according to Moses his philosophy, the soul is secure both from death and from sleep after death; which those drowsie *nodders* over the letter of the scripture have very oscitantly collected, and yet as boldly afterwards maintained, pretending that the contrary is more platonical than christian or scriptural.

Henry More. *A Conjectural Essay. Epistle Dedicatory*, sig. Eee.

Th' affrighted hills from their foundations *nod*,
And blaze beneath the lightnings of the god.

Pope. *Homer. Iliad*, book xvii.

They neither plough, nor sow; ne fit for flail,
E'er to the barn the *nodden* sheaves they drove.

Thomson. *The Castle of Indolence*, can. 1.

NODDLE, *n.* Minshew thinks it is the *nodding* part of the head. Skinner that it is from A. S. *knol*, the top. See NOWL, or NOLL.

The head; familiarly, or contemptuously.

For occasion (as it is in the common verse) turneth a bald *noddle*, after she hath presented her locks in front, and no hold taken.

Bacon. *Essay* 21. p. 125.

ITUTCH. You say very right, sir Oliver, very right;
I have't in my *noddle*, i'faith.

Barry. *Ram-Alley*, act iv. sc. 1.

He'll lay on gifts with hands, and place
On dullest *noddle* light and grace,
The manufacture of the kirk.

Butler. *Hudibras*, part i. can. 3.

Fix'd on his *noddle*, an unseemely pair,
Flagging, and large, and full of whitish hair.

Croxall. *Ovid. Metamorphoses*, book xi.

NODE, } Lat. *nodus*, *nodosus*; Fr. *noeud*;
NO'DOUS, } It. and Sp. *nodo*. Vossius derives from
NODO'SITY. } the Hebrew. Tooke from the A. S.
knittan, to knot, *nectere*, *connectere*.

A knot or knob, a connection or complication, a lump, protuberance, or swelling.

The nodes of a planet. *Les nœuds d'une planète*. See the Quotation from Maclaurin, and the *Essay on ASTRONOMY*.

For the wens called scrophules or the king's evil (it is good also to be used) the knots and *nodosities* growing upon the joints.

Holland. *Plinie*, book xxiv. ch. v.

These therefore the midwife cutteth off, contriving them into a knot close unto the body of the infant, from whence ensueth that tortuosity, or complicated *nodosity*, we usually call the navel; occasioned by the colligation of vessels before mentioned.

Sir Thomas Brown. *Vulgar Errours*, book v. ch. v. p. 291.

This [the ring finger] is seldom or last of all affected with the gout, and when that becometh *nodous*, men continue not long after.

Id. *Ib.* book iv. ch. iv.

Those minerals in the strata, are either found in grains, or else they are amassed into balls, lumps, or *nodules*; which *nodules* are either of an irregular figure, or of a figure somewhat more regular.

Woodward. *Natural History*.

The centre of the moon appears to us to trace a different circle from the elliptic, the circle which the centre of the sun appears to describe in the heavens. These circles cut each other in two opposite points, that are called by astronomers the nodes of the moon.

Maclaurin. Sir Isaac Newton. *Philosophical Discourse*, book iv. ch. iv.

NODOSARIA, in *Zoology*, a genus of *Cephalopodous Mollusca*.

NOD.
—
NODO-
SARIA.

NODO-
SARIA.
—
NOINT.

Generic character. Shell elongated, straight, or a little bent, subconical, nodose, with bulgings at the place of the cells; transverse septa perforated.

Type of the genus, *N. radícula*. Phancus, pl. i. fig. 5. Inhabits the Adriatic Sea.

NO'DY, or } Skinner; from the Norman Fr.
No'DDY. } *naudin*, which Cotgrave calls, "a noddy, ninny, goosicap, coxcomb." *Naudin*, Skinner suggests, may be from the verb to *nod*; it perhaps is connected with *noddle*; and applied contemptuously to the person, as *noddle* to the thing.

O beastly *nody* wythoute brayne.

Bale. Apologie, fol. 31.

Euë thorowe the grounde it sanke into theyr caues and powred downe vppon theyr heades, and wette them to the skynne, & made them more *nodies* than them that stooode abroade.

Sir Thomas More. Workes, fol. 1436. *Letters, &c. wrote while Prisoner in the Towre of London.*

Or els so foolyshe, that a verye *nodypoll* nydyote myght be ashamed to say it.

Id. lb. fol. 709. The second Part of the Confutation of Tyndall.

What do you think I am?

JASP. An arrant noddy.

Beaumont and Fletcher. The Knight of the Burning Pestle, act ii. sc. 1.

NOEMA'TICAL, } Gr. *νόημα, νοήματος*, the mind,
NOEMA'TICALLY. } the intellect, or understanding.
Mental, intellectual; existing, originating in the mind.

Because when men think never so abstractedly and mathematically of a triangle, they have commonly some rude phantasm or picture of it before them in their imagination. Therefore many confidently perswade themselves that there is no other idea of a triangle or other figure, beside the bare phantasm or sensible idea impressed upon the soul from some individual object without; that is no active *noematical* idea inwardly exerted from the mind itself.

Cudworth. Morality, book iv. ch. iii. p. 200.

By common notions I understand whatever is *neomatically* true, that is to say, true at first sight to all men in their wits, upon a clear perception of the terms, without any further discourse or reasoning.

More. The Immortality of the Soul, book i. ch. ii. *Axiom 3.*

NOG, n. } Skinner refers to the Ger. *nossel*, men-
No'GGING. } *surā liquidi*, a measure of liquids. In English the word is applied to

The vessel or mug; and also to the liquor itself.

Dog Walpole laid a quart of *nog* on't,
He'd either make a hog or dog on't.

Swift. Upon the Horrid Plot.

For all your colloquing, I'd be glad of a *knoggin*;
But I doubt 'tis a sham; you wont give us a dram.

Id. To Dr. Sheridan, Dec. 14, 1719.

When his worship gave *noggins* of ale,
And the liquor was charming and stout,
O those were the times to regale,
And we footed it rarely about.

Lloyd. Song in the Capricious Lovers. Air 4.

NOINT, i. e. ANOINT, q. v.

She fetcht to vs
Ambrosia, that an aire most odorous
Bears still about it; which she *nointed* round
Our either nostrils; and in it quite drown'd
The nastie whale-smell.

Chapman. Homer. Odyssey, book iv. fol. 59.

For then they did *noint* themselves with sweet oyles, and did shed their hair, remembering *Lycurgus'* saying, who was wont to tell them that hair to them which were fair, did make them more fair, and to them that were foul they made them more ugly and dreadful.

Sir Thomas North. Plutarch, fol. 43. *Lycurgus.*

This was the cause they were always so nasty and sluttish, and they never used to bathe or *noint* themselves, saving onely at certain days in the year when they were suffered to taste of this refreshing.

Id. lb. fol. 45.

NOISE, v.

NOISE, n.

NOI'SEPUL,

NOI'SEFULLY,

NOI'SELESS,

NOI'SY,

NOI'SILY.

Outcry, uproar, clamour, a loud sound or report, a report or rumour; generally, a sound. To *noise*, To sound, to resound, to report.

Vor of trompes & of tabors þe Saracens made þere
So gret *noyse*, þat Christenmen al distourbed were.

R. Gloucester, p. 396.

But thei seiden not in the haly day lest peraventur *noyse* were maad in the puple.

Wiclif. Matthew, ch. xxvi.

Why *noisen* ye, or bosten of your elders?

Chaucer. Boecius, book iii. p. 427.

For I without *noise* or cry

My plaint make all buxomly,

To putten all wrath awaie.

Gower. Conf. Am. book iii. p. 77.

For Mardocheus was grete in the kinges house, and the reporte of hym was *noysed* in all lands, howe he increased and grewe.

Bible, Anno 1551. Esther, ch. ix.

At the same time it was *noised* abroad in the realme, that *Ferquhard*, besides other his wicked behauiours, was also infected with the erronious opinions of the Pelagian heresie.

Holinshed. Works, vol. v. fol. 172. *Ferquhard.*

When *noisefull* Neptune tost

Vpon his watry brissels, my imbost

And rock-torne body.

Chapman. Homer. Odyssey, book vi. fol. 97.

Asyias being comonly and most properlie taken in the worse part, and signifieth shrillie, or *noisefullie*, squeaking.

Id. lb. Iliad, book ii. fol. 35. *Commentarius.*

The man that taught confusion's art;

His treason's restless, and yet *noiseless* heart.

His active brain like *Etna's* top appear'd

Where treason's forg'd, yet no *noise* outward heard.

Cowley. On the late Civil War. (1679.)

One would think that every letter was wrote with a tear, every word was the *noise* of a breaking heart.

South. Sermons, vol. iv. p. 31.

For her, O Sleep! thy balmy sweets prepare;

The peace I lose for her, to her transfer,

Hush'd as the falling dews, whose *noiseless* showers,

Impearl the folded leaves of evening flowers,

Steal on her brow.

Congreve. To Sleep. Elegy.

The king's demand of a supply produced one of those *noisy* speeches which disaffection and discontent regularly dictate.

Johnson. The Life of Waller.

NOISETTIA, in *Botany*, a genus of the class *Pentandria*, order *Monogynia*, natural order *Violariæ*. *Generic character*: calyx five-leaved, inferior, petals of the corolla large, the two lateral petals short, ascending, the others small; stamens free, filaments dilated at the base; capsule ovate, obsoletely three-angled; seeds few. Three species, natives of North and South America. *Decandolle.*

NOISOME. See *Nox*.

NOLA, in *Zoology*, a genus of *Lepidopterous* insects.

Generic character. *Antennæ* simple in both sexes, ciliated within in the males; *palpi* short, porrect, the terminal joint not recurved over the head, triarticulate, the second and third joints nearly equally long and equally squamose; wings anterior rounded, placed in a triangle during repose, the posterior completely covered by the anterior; legs short, simple.

NOISE.

NOLA.

NOLA. Type of the genus, *Tinea cucullatella*, Linnæus.
NOMADS. *Pyrallis palliolalis*, Hubner, *Pyr.* pl. xxiii. fig. 149. Four species, natives of Britain.

NOLANA, in *Botany*, a genus of the class *Pentandria*, order *Monogynia*, natural order *Boraginæ*. Generic character: calyx five-cleft, segments broad; corolla bell-shaped; stigma capitate, slightly pentagonal; seeds five; receptacle fleshy.

Five species, natives of Peru. *N. prostrata*, an elegant creeping plant, is frequently met with in English collections.

NOLINEA, in *Botany*, a genus of the class *Hexandria*, order *Trigynia*. Generic character: corolla six-parted, spreading; style very short; capsule triangular, membranaceous, three-celled, dissepiment bursting in two parts; seeds solitary.

One species, *N. Georgiana*, native of Georgia.

NOLITION, from Lat. *nolle*, i. e. *non velle*, to will not.

The principal part of that analogical providence that the soul exerciseth in relation to the microcosm or humane compositum are intellection, deliberation, and determination in the understanding; and choice, volition, *nolition*, and purpose in the will.

Hale. *Origination of Mankind*, ch. i. p. 28.

NOLL, } A. S. *cnolle*, *knol*; D. *knolle*; Ger.
Nowl. } *knoll*; Sw. *knula*; the head or top.
 The head.

With hard *noll* and uncircumcidid hertis and eeris ghe with stoden euermore the Hooli Goost, and as ghoure fadris so ghe.

Wiclif. *The Dedis of Apostlis*, ch. vii

We call him goose, and disarde doul,
 and fowlye fatted *nowle*.

Drant. *Horace. Satire 3. sig. K. 4.*

NOLLETH, i. e. *ne willeth*; *willeth not*.

N'OLDE, i. e. *ne wolde*; *would not*.

So þharded, þat hii beþ blynde & deue ywýs
 þat hii *nolleþ* non god þýng þhure ne ý se.

R. Gloucester, p. 352.

What shuld I more say, but this millere
 He *n'olde* his wordes for no man forbere,
 But told his cherles tale in his manere,
 Me thinketh, that I shal reherse it here.

Chaucer. *The Milleres Tale*, v. 3168.

The faithful steele such treason *n'ould* endure,
 But, swarving from the marke, his lordes life did assure.

Spenser. *Faerie Queene*, book ii. can. 8.

NOMADA, in *Zoology*, a genus of *Hymenopterous* insects.

Generic character. *Antennæ* filiform; labial *palpi* with the two apical joints placed obliquely and externally, but the penultimate on the apex of the preceding; maxillary six-jointed; mandibles slender, acute, unidentate on the inner edge; *labrum* rather broader than long; *abdomen* slightly pubescent, ovate; body rather smooth; wings four; anterior with three submarginal areolets complete.

Type of the genus, *N. ruficornis*, Fabricius. Panzer, *Faun. Germ. Ins.* pl. v. fig. 18. A very numerous genus, of which the species frequent warm dry hedgebanks in gravelly or sandy situations. About eight and thirty have been detected in Britain.

NOMADS, Gr. *νομάδες*, from *νέμειν*, to feed.

The Quotations explain the word.

For all these, in what part of the world soever, which in old time lived by *pastorage*, and fed (as we call it in Ireland) upon white-meat without tilling of the ground, are called by the Greeks *nomades*,

and by the Latines *pastoris vagi*, as the northern Tartarians, the Getulians, and Numidians in Africa, the ancient Britons, and the Northern Irish.

Ralegh. *History of the World*, book i. ch. v. sec. 2. fol. 43.

The Numidian *nomades*, so named of *changeing their pasture*, who carrie their cottages or sheddies (and those are all their dwelling houses) about with them upon waines.

Holland. *Plinie*, vol. i. ch. iii.

NOMBLES. See NUMBLES.

NOMENCLA'TOR, } Fr. *nomenclateur*; It. *no-*
NOMENCLA'TRESS, } *menclatore*; Sp. *nomenclatôr*;
NOMENCLA'TURE. } Lat. *nomenclator*, *nomencla-*
tura; a *nomine calando*, i. e. *vocando*; from *calling*
by name; that is by their proper names.

One who *calls* (persons or things) by their (proper) names.

In the old ages they (princes) were euer wount to haue about them such men as were of a speciall memorie; to put them in mind of all such things as to them should be meet and requisite, and these were called *nomenclatores*.

Holinshed. *The Conquest of Ireland*, vol. vi. book i. ch. xlvi p. 179.

Adam (God's *nomenclator*) could not frame
 One that enough should signify.

Cowley. *Her name*.

For the watry plantations were first existent, and as they enjoyed a priority in form had also in nature precedent denominations: but falling not under that *nomenclature* of Adam, unto terrestrious animals assigned a name appropriate unto their natures.

Sir Thomas Brown. *Vulgar Errours*, book iii. ch. xxiv.

As Roman noblemen were wont to greet
 And compliment the rabble in the street,
 Had *nomenclators* in their trains, to claim
 Acquaintance with the meanest by his name.

Butler. *Human Learning*, part i.

I have a wife who is a *nomenclatress*, and will be ready, on any occasion, to attend the ladies.

Guardian, No. 109.

The new *nomenclature* which has been introduced into chymistry, seems to me to furnish a striking illustration of the effect of appropriated and well-defined expressions, in aiding the intellectual powers.

Stewart. *Philosophy of the Human Mind*, ch. iv. sec. 4. p. 203.

NOMEUS, Cuv. In *Zoology*, a genus of animals belonging to the family *Scomberoides*, order *Acanthopterygii*, class *Pisces*.

Generic character. Body rounded, thicker in the middle than at either end; two dorsal fins; pectorals not spined; ventrals very large and wide, attached to the belly by their inner edge; gill-flaps covered with smooth scales.

This genus was long included among the *Gobii* till separated by Cuvier: one species only is known. The

N. Gronovii, Cuv.; *Gobius Gron.* Gmel.; *Mugil Americanus*, Ray. The head is covered with large scaly plates; eyes large, and far apart; mouth narrow; palate and jaws armed with teeth of equal size; tongue smooth, slender, and rounded; the back is black, the belly and sides silvery-white, but the latter marked with black spots. It is found in the Equatorial seas of America, and was first discovered by Gronow, whose name it bears.

See Cuvier, *Règne Animal*.

NOMIA, in *Zoology*, a genus of *Hymenopterous* insects.

Generic character. *Antennæ* filiform; *labrum* entire; *labium* with the intermediate divisions longer than the lateral ones as long as the head, and very hairy or tomentose; wings four; anterior with three complete

NOMADS.

NOMIA.

NOMIA. submarginal areolets; hinder legs of the males with dilated incrassated tibiae and thighs.

NONAGE Type of the genus, *N. diversipes*, Latreille, *Gen. Crust. et Ins.* vol. iv. p. 155. pl. xiv. fig. 8. Several species, natives of Europe, but neither of them have hitherto been detected in Britain.

NOMINAL, *adj.* } Lat. *nominalis*, from *nomi-*
NOMINAL, *n.* } *nare*, to name; *q.* a word com-
NOMINALISTS, } mon to the Northern, as well
NOMINALLY, } as to the Greek and Latin Lan-
NOMINATE, } guages.
NOMINATION, } That can or may be named;
NOMINATOR, } of or pertaining, belonging or
NOMINATELY, } relating to the name; opposed
to real.

For the application to a Sect of Philosophers, see the Quotations from Reid and Stewart.

The Pope opyned his graces to all clerkes beyng in the courte for the space of a moneth: and gaue the *nomynacions* to the kyng, of all coledges and cathedrals.

Lord Berners. *Froissart. Cronycle*, vol. ii. ch. 160. p. 441.

And because of these two effectes which it worketh (for it both shutteth and openeth) hath it the *nomination* of kayes, and yet (as I said) indeede it is but one, which is the worde of God.

Frith. *Workes*, fol. 58. *Answer to my Lord of Rochester*.

Which [the *Novum Organum* of Bacon] by the most of superficial men, who cannot get beyond the title of *nominals*, is not penetrated, nor understood.

Ben Jonson. *Discoveries*, fol. 102.

Moreouer one holdeth this, an other that. One is real, an other *nominal*. What wonderfull dreams haue they of their predicamentes, uniuersales, &c.

Tyndall. *Workes*, fol. 104. *The Obedience of a Christian Man*.

They concluded at the vpsshot, that all the French should depart out of England by a day, few excepted, whom the king should appoint and *nominate*.

Holinshed. *The Description of Britain*, vol. i. ch. iv. p. 12.

Locus religiosus is that which is assigned to some office of religion, and *nominate*ly where the body of a dead person hath been buried.

Spelman. *Works*, fol. 180. *De Sepultura*, canon vii.

I call it by a peculiar name, the *nominal* essence, to distinguish it from that real constitution of substances, upon which depends this *nominal* essence, and all the properties of that sort; which therefore, as has been said, may be called the real essence.

Locke. *Of Human Understanding*, book iii. ch. vi. sec. 2.

The *nominalists* were not only more than ever opposed by the other scholasticks, the Scotists especially, but so persecuted by the court of Rome, and all the fautors of her usurpations, that their whole doctrine was condemned by Lewis the Eleventh, in a publick edict, before the end of the fifteenth century.

Bolingbroke. *Works*, vol. vii. p. 266. *Essay 4*.

While Tiberius Gracchus was creating new consuls, one of the *nomimators* suddenly fell down dead: however Gracchus proceeded and finished the creation.

Bentley. *Of Free Thinking*, p. 226.

About that time [the twelfth century] Roscelinus or Roscelinus, the master of the famous Abelard, introduced a new doctrine, that there is nothing universal but words or *names*. However, by his eloquence and abilities, and those of his disciple Abelard, the doctrine spread, and those who followed it were called *Nominalists*.

Reid. *Of the Human Mind*, vol. ii. p. 161. *Essay 5*. ch. vi.

The principal cause, however, I am disposed to think, of the decline of the sect of *Nominalists*, was their want of some palpable example, by means of which they might illustrate their doctrine.

Stewart. *Philosophy of the Human Mind*, ch. iv. sect. 3. p. 183.

The council of admiralty has the same power with regard to the navy, together with the *nomination* of the captains and all inferior officers.

Hume. *Essay 16*. vol. i. p. 498.

NO'NAGE, } Lacombe has "*nonage, minorité*."
NO'NAGED, } *Non* and *age*; *not* of *age*.

Infancy or minority (in Law.)

EUPH. That thing they would keep in everlasting *nonage*,
My brother for his own ends has thrust on
Upon my mistress.

Beaumont and Fletcher. *The Queen of Corinth*, act ii. sc. 1.

But King Henrie died during the *nonage* of this Alexander, whereby he receiued not his homage.

Holinshed. *The Description of Britain*, vol. i. ch. xxii. p. 209.

Here could I spend that spring of Poesie,
Which not twice ten sunnes have bestow'd on me,
And tell the world, the Muse's love appears
In *nonag'd* youth, as in the length of years.

Browne. *Britannia's Pastorals*, book i. song 5.

Mature by vernal dews, this dares display,
Its leaves full blown, and boldly meets the day;
That folded in its tender *nonage* lies,
A beauteous bud, nor yet admits the skies.

Hughes. *Claudianus*.

NONAGRIA, in *Zoology*, a genus of *Lepidopterous* insects.

Generic character. *Palpi* nearly vertical, very thickly clothed with elongate scales on the two basal joints, the terminal one exposed, with the scales rather elongated beneath; basal joint (denuded) reniform, nearly horizontal, stouter than the following, and above half its length; the second rather elongate, straight, acuminate; the terminal very short, ovate; *maxillæ* moderate; *antennæ* rather short, stout, subserrated, sometimes a little pectinated in the males, pubescent within; head small, subtriangular, with a dense tuft of scales on the forehead; eyes large, globose, naked; *thorax* rather stout, slightly marked anteriorly; *abdomen* elongated, not very robust, with a large tuft at the apex, especially in the males; wings deflexed during repose; anterior elongate, narrow, slightly crenated on the hinder margin; posterior somewhat triangular, faintly denticulate; *larva* fleshy, internal; *pupa* also internal.

Type of the genus, *Ph. No. Typhæ*, Esper; Hubner, *Noc.* pl. lxxxviii. fig. 415. About eight species, which inhabit marshy districts of Europe; four of them are indigenous.

NONATELIA, in *Botany*, a genus of the class *Pentandria*, order *Monogynia*. **Generic character:** calyx five-toothed; corolla tubular, seed-vessel a striated berry, five-celled, five-seeded.

One species, *N. racemosa*, native of Guiana.

NONCE, anciently written *nones* or *nanes*; and *once*, *q. v.* was formerly written *ones*, *anes*; in the expression for the *nonce*, *nonce* is corruptly used for *once*; for the *once*, this *once*, the or this *one* thing, *one occasion*, for an especial purpose. Mr. Gifford observes, "The aptitude of many of our monosyllables beginning with a vowel to assume the *n* is well known; but the progress of this expression is distinctly marked in our early writers; *a ones*, *an anes*; for the *ones*, for the *nanes*, for the *nones*, for the *nonce*."

And he adde vor þe *nones* tweye suerdes by ÿs syde.

R. Gloucester, p. 285.

In a fertre þam laid a riche for the *nones*.

R. Brunne, p. 36.

Steuen com for þe *nones*, þis lond to haf he þouht.

Id. p. 108.

A coke they hadden with hem for the *nones*,
To boile the chickenes and the marie bones.

Chaucer. *Prologue to the Canterbury Tales*, v. 381.

A stil water for the *nonnes*
Rennend vpon the small stones,
Whiche hight of Lethes the riuier.

Gower. *Conf. Am.* book iv. p. 118

NONAGE.

NONCE.

NONCE.

NONE.

Would you live free from all diseases,
Doe the act your mistress pleases ;
Yea, fright all aches from your bones ?
Here's a med'cine for the *nonces*.

Ben Jonson. *The Fox*, act ii. sc. 2.

His bodie was found, not inclosed within a toombe of marble or
other stone curiouslie wrought, but within a great tree made hollowe
for the *nonce*, like a trunke.

Holinshed. *The History of England*, vol. i. book i. ch. xiii. p. 577.

NONCONFO'RMING, } *i. e. not conforming ;*
NONCONFO'RMIST, } refusing to conform, re-
NONCONFO'RMITY. } fusing or rejecting *unifor-*
mity ; not complying, yielding, or assenting.

And I believe it will be one day found, that nothing has contri-
buted more to make the dissenting *nonconforming* party consider-
able, than their being thought so.

South. *Sermons*, vol. v. p. 492.

How (will a wise and good man say) can I desire to prosper and
flourish, while the state is in danger or distress ? how can I grieve,
seeing my country is in good condition ? is it just, is it handsome,
that I should be a *non-conformist* either in publick sorrow or joy ?

Barrow. *Sermon 9*. vol. iii. fol. 107.

By that Act [the Five Mile Act] passed in the Parliament held at
Oxford the 9th of October, 1665, and entitled, An Act for restrain-
ing *non-conformists* from inhabiting corporations ; the *non-conform-*
ing ministers were prohibited, upon a penalty of forty pounds for
every offence, to come, unless only in passing upon the road, within
five miles of any city, corporation, &c.

Locke. *Works*, vol. iv. p. 541. *A Letter from a Person of Quality*.

He [Stedman] removed to Okingham, or Workingham, in Berks,
and thence, two years after, was ejected for *nonconformity*.

Wood. *Athenæ Oxonienses*, vol. ii. p. 520.

Non-conformists are of two sorts ; first, such as absent themselves
from divine worship in the established church through total irrelig-
ion, or attend the service of another persuasion.

Blackstone. *Commentaries*, book iv. ch. iv. p. 52.

Another species of offences against religion are those which affect
the established church, and these are either positive or negative ;
positive, by reviling its ordinances ; or negative, by *non-conformity*
to its worship.

While I was with hem I kepte hem in thei name, thilke that thou
ghauest to me I kepte, and *noon* of hem perisschide but the sone of
perdicoun, that the scripture be fulfillid.

Wiclif. *John*, ch. xvii.

Whyll I was with them in the worlde, I kepte them in thy name.
Those that thou gauest me haue I kepte, and *none* of them is lost,
but that lost childe, that the scripture might be fulfilled.

Bible, Anno 1551.

But hode, for jolite, ne wered he *non*
For it was trussed up in his wallet.

Chaucer. *The Knightes Tale*, v. 682.

Lerneth to suffren, or so mote I gon
Ye shul it lerne whether ye wol or *non*.

Id. *The Frankeleines Tale*, v. 10090.

Where there is no good
For which to strive, no strife can grow up there
From faction ; for *none* sure will claim in Hell
Precedence, *none*, whose portion is so small
Of present pain, that with ambitious mind
Will covet more.

Milton. *Paradise Lost*, book ii. v. 32.

It has been observed in former times that *none* have been so
greedy of employments, and of managing the public, as they who
have least deserved their stations.

Dryden. *Dedication to the Georgics*.

NONJU'RING, } Not swearing ; one who does
NONJU'ROR. } not, or will not swear : (*sc. alle-*
giance.) Usually applied to those persons, especially
Clergymen, who refused to take the oaths of allegiance
to William III. at the Revolution.

Thus the papists and *nonjurors* have been doubly taxed for re-
fusing to give proper securities to the government ; which cannot
be objected against the clergy.

Swift. *Works*, vol. ix. p. 341. *Reasons against settling the Tithe*
of Hemp, &c.

Every person refusing the same (oaths of allegiance, supremacy,
and abjuration) who is properly called a *non-juror*, shall be adjudged
a popish recusant convict.

Blackstone. *Commentaries*, book iv. ch. ix. p. 124.

The character of a *non-juror*, which he maintained to the last, is
a sufficient evidence of his principles in church and state ; and the
sacrifice of interest to conscience will be always respectable.

Gibbon. *Miscellaneous Works*, vol. i. p. 14. *Memoirs of my own*
Life.

NONPAREIL, *non*, and *pareil*, Fr. like, equal,
even, or matching with. Lat. *par*.

Having no like or equal, match or fellow ; one un-
paralleled, unequalled, unmatched, unrivalled.

My lord and master loues you ; O such loue
Could be but recompenc'd, though you were crown'd
The *non-pareil* of beautie.

Shakspeare. *Twelfth Night*, fol. 259.

In the mean time the most *nonpareil* beauty of the world,
beauteous knowledge, standeth unregarded, or cloistered up in mere
speculation.

Whitlock. *Manners of the English*, (1654,) p. 204.

NO'NPLUS, *v.* } *Non*, not, and *plus*, more.
NO'NPLUS. } To do, to be able to do, no more ;
to disable from doing more.

And we have known some, who were confidently engaged in the
other opinion ; being put to read the beginning of Tully's offices,
presently *non-plus* and confounded, in that first word *quanquam*.

Cudworth. *Intellectual System*, book i. ch. iv. fol. 636.

And then for his eternity, which *non-plusses* the strongest and
clearest conception, to comprehend how one single act of duration
should measure all periods and portions of time, without any of the
distinguishing parts of succession.

South. *Sermons*, vol. i. p. 20.

So over and above it (the acknowledging of a creation) gives me
this advantage, that, let it seem never so strange, uncouth, and im-
possible, the *nonplus* of my reason will yield a fairer opportunity to
my faith.

Id. *Ib.* p. 47.

NONPOWER, *i. e. impotence*.

Yet besides is there mokell folke, of whiche he hath no com-
maundemente ne lordship, and there as lacketh his power, his *non-*
power entereth, where vnder springeth that maketh hem wretches.

Chaucer. *The Testament of Loue*, book ii. p. 488.

NONPROFICIENT, one who is *no proficient*, or
not a proficient, or who has made no *proficiency*, who
does not *profit*, gain, or benefit.

No marvel if we be whipped for dull *non-proficients* in God's
school, if we be not taught fear and obedience by his so many judg-
ments.

Hall. *Sermon 34*.

There is no creature of whom we may not learn something ; we
shal have spent our time ill in this great school of the world, if in
such store of lessons we be *non-proficients* in devotion.

Id. *The Devout Soul*, sec. 6.

NONRE'SIDENT, } One who does not *reside*,
NONRE'SIDENCE. } (*q. v.*) abide or dwell.

After these actes, thus agreed the commons, made another acte
for pluralities of benefices, *none-residence*, biyng and selling and
takyng of fermes by spirituall persons.

Hall. *Henry VIII. The twenty-first Yere*.

NONE.

NONRE-

SIDENT.

NONRE-
SIDENT.
—
NON-
SUIT.

As to *non-residence*, I believe there is no christian country upon earth, where the clergy have less to answer for upon that article. I am confident there are not ten clergymen in the kingdom, who properly speaking, can be termed *non-residents*; for surely we are not to reckon in that number those, who, for want of glebes, are forced to retire to the nearest neighbouring village for a cabin to put their heads in.

Swift. Works, vol. ix. p. 267. *Arguments against the Power of Bishops*.

Licensed pluralists are allowed to demise the living, on which they are *non-resident*, to their curates only; provided such curates do not absent themselves above forty days in one year.

Blackstone. Commentaries, book ii. ch. xx. p. 322.

The leases of beneficed clergymen are farther restrained, in case of their *non-residence*, by statutes 13 Eliz. c. 20. &c.

Id. Ib.

NONRESISTANT, *adj.* } Not resisting; not
NONRESISTANT, *n.* } standing against, or
NONRESISTANCE. } opposing.

The slavish principles of passive obedience and *non-resistance*, which had skulked perhaps in some old homily before king James the first, but were talked, written, and preached into vogue in that inglorious reign, and in those of his three successors, were renounced at the revolution by the last of the several parties who declared for them.

Bolingbroke. Works, vol. iii. p. 126. *A Discourse upon Parties*, let. viii.

This is that *Œdipus*, whose wisdom can reconcile inconsistent opposites, and teach passive obedience, and *non-resistant* principles to despise government, and to fly in the face of sovereign authority.

Arbuthnot.

NONSENSE, } *i. e. not sense*; that which is
NONSENSEICAL, } not intelligible, not to be under-
NONSENSEICALLY, } stood or comprehended; which
NONSENSEITIVE. } has no meaning, or that is un-
meaning: not worth a thought.

How did he shame the doctrine-men, and use,
With helps to boot, for men to beare th' abuse
Of their tir'd patience, and endure th' expence
Of time, & spent in harkning to *non-sense*,
With markes also enough whereby to know,
The speaker is a zealous dunce, or so.

Donne. Poems. Elegy by Mr. R. B. in Memory of Dr. Donne.

The accompt which Theodorus in Photius (treating of the Persian Magick) gives thereof, as also that other of Eudemus in Damascius, are both of them so *nonsensical*, that we shall not here trouble the reader with them.

Cudworth. Intellectual System, book i. ch. iv.

Never was any thing more *nonsensically* pleasant.

L'Estrange. Translation of Quevedo.

Undoubtedly, whatsoever we preach of contentedness in want; no precepts can so gain upon nature, as to make her a *non-sensitive*.

Feltham. Resolve 14. fol. 35.

You may rest satisfied; that what is *nonsense* upon a principle of reason, will never be *sense* upon a principle of religion.

South. Sermons, vol. ii. p. 453.

The literal sense is hard to flesh and blood,
But *nonsense* never can be understood.

Dryden. The Hind and the Panther.

If any man uses these terms in such cases, he either uses them *nonsensically*, or in some new sense, diverse from their original and proper meaning.

Edwards. On the Freedom of the Will, part i. sec. 3. p. 21.

NONSPARING, *i. e. sparing none*; unsparing any.

Poore Lord, is't I
That chace thee from thy countrie, and expose
Those tender limbs of thine, to the euent
Of the *none-sparing* warre?

Shakspeare. All's Well that ends Well, fol. 242.

NONSUIT, *v.* } The Quotations explain the mean-
NONSUIT, *n.* } ing and application of the word.

Formerly they (common pledges) were of use to answer to the king for the amercement of the plaintiff, in case he were *nonsuited*.

VOL. XXV.

He is adjudged not to follow or pursue his remedy as he ought to do, and thereupon a *nonsuit* or nonprosequitur is entered; and he is said to be nonpros'd.

Blackstone. Commentaries, book iii. ch. xx.

If either party neglects to put in his declaration plea, replication, rejoinder, and the like, within the times allotted by the standing rules of the court, the plaintiff, if the omission be his, is said to be *nonsuit*, or not to follow and pursue his complaint, and shall lose the benefit of his writ.

Id. Ib. book iii. ch. xxi.

NONSUIT, in Law, is one of the ways in which an Action may terminate unfavourably to the Plaintiff. The mode in which the Plaintiff is nonsuited is as follows. The cause having come on for trial, and the jury being ready to pronounce their verdict, the Plaintiff is cited to appear in Court, and then, upon his not appearing in obedience to the citation, a memorandum of his non-appearance is entered on the record of the proceedings in the cause, and the jury are not required to pronounce any verdict, the non-appearance of the Plaintiff being considered a voluntary abandonment of his claim. The entry on the record is that "the Plaintiff being solemnly called comes not, nor does he further prosecute his writ against the Defendant." This entry was formerly made in Latin, and the word *Non-suit* is derived from the Latin formula. It was the practice in ancient times to call the Plaintiff in every cause, before the jury pronounced their verdict: the object of this was that the Plaintiff might be amerced or fined for his false claim, in case the jury should find the truth of the case to be against him. But amercements on such occasions have long become obsolete, and, according to the present practice, the Plaintiff is never called, except when it is intended that he shall be Nonsuited. The citation or calling of the Plaintiff is made by one of the officers of the Court. After the Plaintiff has thus abandoned his claim and been Nonsuited, judgment is given for the Defendant, which judgment is called judgment of Nonsuit.

The occasions on which a Plaintiff is Nonsuited are usually those when he is not able to produce evidence sufficient to make out a *prima facie* case in support of his claim. For instance, if an Action is brought for an assault, the Plaintiff will be Nonsuited if he cannot produce evidence to show that an assault was committed. In this instance it would obviously be unjust to call upon the Defendant to defend himself against a charge which is not even *prima facie* established against him: and it is unnecessary to require the jury to pronounce a verdict, as in the absence of all evidence in support of the charge they cannot do otherwise than find for the Defendant. The case just supposed is one where there is a failure of evidence in *toto*; but the practice of Nonsuiting the Plaintiff equally prevails, where there is a failure in the proof of some particular point, which is necessary to render the chain of evidence complete. For instance, if the Plaintiff sues in the character of indorsee of a bill of exchange, and the Defendant is the drawer of the bill: in this case the Plaintiff will have to establish two points, 1st, that the Defendant drew the bill; 2dly, that the bill was endorsed to the Plaintiff; and if he fail in proving either of these, he will be Nonsuited, though he succeed in proving the other.

If the Plaintiff appears, when he is cited to appear, the case must be left to the jury, and there can be no Nonsuit. It is therefore always optional with the Plaintiff whether he will be Nonsuited or whether the case shall go to the jury. Sometimes the Counsel for

NON
SUIT.

NON-
SUIT.
—
NOON.

the Plaintiff, being dissatisfied with the grounds upon which the Judge wishes to Nonsuit the Plaintiff, will refuse to be Nonsuited, and insist upon the case being left to the jury: and sometimes, on the other hand, when the Judge is about to leave the case to the jury, if the Counsel for the Plaintiff thinks that there is little chance of the jury finding in his favour, and that on a future trial he will probably be able to strengthen his case, he will elect to be Nonsuited. The advantage of being Nonsuited is that the Plaintiff may afterwards bring another Action for the same cause; whereas if the jury by their verdict find the truth of the matter to be against him, he is for ever concluded by that verdict, and cannot bring another action.

Similar to the *judgment of Nonsuit* is the *judgment as in case of Nonsuit*. This judgment is given in certain cases where the Plaintiff has neglected to take the cause down to trial. Without a trial there cannot be a Nonsuit. Formerly, when the Plaintiff neglected so to do, the Defendant was obliged to take the cause down to trial, and then if the Plaintiff did not appear to prosecute his cause the Defendant Nonsuited him. But now, in certain cases, the Defendant is enabled to obtain judgment without taking the cause down to trial, and as this mode of obtaining judgment is merely substituted for the circuitous and expensive mode of taking the cause down to trial, and Nonsuiting the Plaintiff, it is called *judgment as in case of Nonsuit*.

NOOK, Lye refers to *nock* or *notch*; and Tooke believes them all to be the past participle of the verb to *nick*, *incidere*. *Nook* is applied to

A small recess or retreat, (*q. d. cut into a solid body,*) a corner.

This poisons all, and minds of men doth marre,
It findeth *nookes* to creepe in for the noones.

NORAN-
TEA.

NORD.

NORD, a Department of France, nearly coextensive with the former Province of Flanders, is bounded on the North by the German Ocean, East by Belgium, South by the Department of Aisne, and West by that of Pas de Calais. Its territory is the most productive in France, and it is the most populous of the Departments, except that of Seine, in which the Capital is situated. On its superficial extent of 3396 British square miles it has a population of 962,000 persons, and, consequently, 283 to each square mile. The soil in the Northern or maritime part is flat and marshy, but very fertile, and is principally employed for the pasture of horned cattle, which grow to a great size. The dairy is there the chief object of the farmer's attention, and butter and cheese are produced in great quantity and of excellent quality. The forest of Nieppe extends to the South of this tract, and its timber is employed in supplying Lille with fuel. The Country becomes rougher towards the South, and some considerable eminences vary the surface in the vicinity of Cambray. The South-Eastern part, lying about Avesnes, is the least productive, and only barley, oats, pulse, and the hardier kinds of fruit can be cultivated to advantage. An extensive and rich bed of coal is worked with great activity in the vicinity of Valenciennes. The rivers are, the Scheldt, here near its source and of insignificant size, the Scarpe its tributary, the Lys, the Aa, and the Sambre. It is besides intersected by many canals, constructed for the purposes of drainage and inland navigation. The principal is that forming a communication between the Somme and Scheldt, constructed at a great expense, as a considerable part of its line consists of tunnels. The mineral springs of St. Amand are much frequented from their efficacy in the treatment of rheumatic affections. The staple produce of the Department is corn, of which the greater part is employed in the production of spirits. Flax and rapeseed are its other principal crops; pulse, fruit, and tobacco are also produced in large quantities. Both the soil and climate are unfavourable to the grape, and beer is the usual beverage. The principal manufactures are fine and coarse woollen cloths, flaxen goods of every quality, and earthenware. It is divided into the districts Lille, Avesnes, Cambray, Douay, Dunkirk, Hazebrouck, and Valenciennes, each named after their principal towns.

CAMBRAY and DUNKIRK have been separately described.

Avesnes.

Avesnes is a frontier town so strongly fortified that it was included among the places reserved for the cautionary occupation of the Allies after the second Treaty of Paris, in 1815. Numerous quarries exist in its neighbourhood, and in the town itself are several iron-foundries and smelting-houses. Population 2700. Distant 9 miles from Maubeuge.

Douay.

Douay stands on both banks of the navigable river Scarpe, and communicates with the Scheldt by the canal of La Sensée. Its manufactures are cotton, linen, lace, and thread; and it maintains a Cannon-foundry, an Arsenal, and an Artillery School. Its former three Colleges, in which so many British Roman Catholic youths used to resort for education, are now consolidated into one. The town is fortified, and protected by a fort on the Scarpe. It was captured by the Duke of Marlborough in 1710, after a siege of nearly two months. Population more than 18,000. Distant from Cambray 15 miles N. W., from Paris 83 N. E.

Haze-
brouck.

Hazebrouck is a well-built town which supports

manufactures of thread and linen. Population 6600. Distant 27 miles W. N. W. from Liege.

Lille, the Capital of the Department, is situated in a fertile and highly cultivated plain and communicates with the harbour of Dunkirk by means of a canal. It is strongly fortified, and its citadel is considered the greatest production of the talents of Vauban. Its seven gates ornamented with sculptures, its wide and well-built streets, handsome squares, and public buildings constructed in an excellent style of architecture, render it one of the most beautiful towns in the Kingdom. The richness of the surrounding territory causes an active and lucrative trade, of which the canal is the principal channel. Much of the ground on which the town is built has been excavated by the quarrying of freestone, and these extensive caverns have served the inhabitants as a place of refuge during the bombardments which it has several times suffered. Its population is 69,000. Latitude 50° 22' North, longitude 3° 7' East.

Valenciennes is a large fortified town on the Scheldt, ill built, in a circular form. Its manufactures are lace, cambric, gauze, and linens. It was taken by the Duke of York in 1794, after an obstinate siege. Population 17,000. Distant 27 miles S. E. from Lille.

Herbin, *Statistique Générale et Particulière de la France*; Malte-Brun, *Précis de la Géographie Universelle*.

NORFOLK, a County of England, is bounded on the North and East by the German Ocean, on the South by Suffolk, and West by Cambridgeshire. It is 64 miles in length, 42 miles in breadth, and has a superficial extent of 1830 square British miles, of which 140 have a soil of very fertile loam, 900 of loam of inferior fertility, 420 of sand capable of profitable cultivation, 220 of a thin, unproductive sand, 82 of peat, and 60 of clay, which from the lowness of its position has a marshy character. The population is 390,054, or 213 to each square mile.

The outline of the coast is a curve little broken by any inlets of the sea and nearly circular. The chalk cliffs forming the Southern and Eastern shores of Britain for a considerable extent, terminate here in brows little elevated above high-water mark. Hunstanton Cliff is the only bold and rocky headland, the other eminences on the shore are principally of clay, and of insignificant height. Much of the coast consists of shingly gravel thrown up by the sea into banks, which, after they have received a surface of sand, are clothed with various species of reeds and sedge. These banks are, in some instances, covered by the sea, and form shoals very dangerous to vessels employed in the coasting navigation. The most remarkable is that which, lying seaward of Yarmouth Roads, constitutes that important place of refuge for shipping. From Caister, about two miles North of Yarmouth, to Happisburg Point, the coast principally consists of sand-hills, called the Marum Hills, which often shift their position, being swept away by the violence of the waves or gales. Where the sand-hills terminate the mud-cliffs commence, and, alternating with shingle, extend to the mouth of the river Nene in the North-Western extremity.

Norfolk is one of the most level tracts in England. The surface is most uneven in the Northern part, where hills clothed with a close and nutritious herbage and fertile valleys are diversified with groves and hedgerows. The soil there is usually a sandy loam very productive under judicious culture. The soil of the

NOR-
FOLK.

Eastern part is generally a tenacious clay abounding in springs. The Western part, bearing the provincial name of West Norfolk, consists principally of a thin, hungry sand, which can be rendered productive only by great exertion of skill and labour. An extensive district on the South-West, is a continuation of the fenny tract extending through Lincolnshire and Cambridgeshire. It is commonly under water in Winter, many parts must be drained every Spring by hydraulic machinery moved by windmills, and where such contrivances are not practicable, sedge and reeds are the only produce. There are few natural woods, the timber with which the County is now adorned owing its origin, generally, to plantations which are most extensive in the North-Western part. Mr. Marsham of Stratton took the lead in this ornamental species of improvement, and his example has been emulated by Mr. Coke of Norfolk, Mr. Windham of Felbrigg, and many others.

Rivers.

Norfolk has many rivers. The Western boundary inland throughout its whole extent is formed by water-courses, the channels of which are either natural, or made continuous by canals. In commencing an examination of this boundary at the Southern extremity we find it formed for a short distance by the Great Ouse, from the left of which a branch is sent off called the Croft, bearing the name of Welney further down, and joined by the Wisbech Canal to the Nene, which from Wisbech forms the boundary to the sea. The

Great Ouse.

Great Ouse runs nearly parallel to this water-course with which it communicates by means of numerous canals easily formed in the intervening Country, every where a level, marshy expanse. The Great Ouse, the waters of which, as well as those of the Nene, have received a classical celebrity from the genius of Cowper, rises in Northamptonshire, enters this County to the South-West of Downham, and after a course of sixty miles falls into the sea two miles below Lynn Regis, of which its mouth forms the haven known by the name of Lynn-deeps. This river exhibits on a small scale the phenomenon of a bore, similar to that which produces such formidable effects in the great tropical rivers. Spelman observes, that it "is remarkable for its extraordinary swell or overflowings at the two Equinoxes, and especially at the full Moon of the Autumnal one, when a vast heap of waters from the sea comes in upon it with such fury, that the inhabitants call it *eager*, which overwhelms every thing in its way, and the very water-fowl shun it." It is navigable twenty-four miles above Lynn for barges, and for small boats as far as Bedford, and by its tributaries extends inland navigation through seven Counties. At Brandon it receives

Wissey, or
Stoke.
Little Ouse.

the Wissey or Stoke River on its right, and higher up on the same side the Little Ouse. This last river rises at Lopham in the South of the County, and having sent off the Waveney Eastward close to its source, flows Westward, forming for a considerable distance the Southern boundary. It is navigable as far as Thetford, where, from the right, it receives the River Thet. The

Waveney.

Waveney, after divaricating from the Little Ouse, forms the Southern boundary, until, having joined the Yare a short distance above Yarmouth, it expands into the Breydon Water. It is navigable as high up as Bungay.

Yare.

The Yare rises at Attleborough, receives the Wenson close to Norwich, and having joined the Waveney, expands into Breydon Water, whence its stream is discharged into the sea a little below Yarmouth. As these rivers rise in marshy lands, and flow through a level

country, their current is slow, and they but imperfectly drain the adjacent country. Swelled by land-floods, and having their mouths often choked with silt thrown up by the violence of the tide, they frequently overflow the low lands, and in their course form numerous small shallow lakes provincially termed *Broads* and *Meers*, of which the largest are Breydon Water, three miles long, and one and a half wide; and Hickling Broad, three miles long and one wide. Numerous canals intersect this County, especially in the low and swampy tract extending through the South-Western part. In addition to the communication afforded by these channels, intercourse is every where facilitated by numerous excellent roads.

Broads.

The climate is considered one of the most inclement in England. Northerly and Easterly winds prevail, and cause cold and harsh weather, and, though loaded with moisture, are unfavourable to vegetation, which is manifestly much slower in its progress here than in the more inland tracts. In the tract forming the South-Western part of the County, and known by the name of Marshland, the air is loaded with miasmata which produce intermittent fevers, usually attacking strangers on their first arrival. The sufferer in such a case is popularly said to be arrested by the Bailiff of Marshland.

Climate.

Though the soil and climate of Norfolk are rather unfavourable to the operations of the farmer, yet it ranks among the very first of English Counties in point of skilful, industrious, and productive agriculture. The cultivation of turnips prevails over that of other crops. About sixty years ago the Western part of the County consisted either of marsh land, or open sheep-walks, and extensive heaths stocked by a miserable race of long-legged sheep, or disfigured by the warrens of innumerable rabbits; the Northern parts were sterile heaths interspersed with a few small and unproductive enclosures. Those tracts now feed numerous herds of heavy cattle, or wave with rich crops of wheat and barley, while the country is sheltered, adorned, and enriched by extensive and thriving plantations. The cultivation of the turnip, besides the direct profit which it yields, improves the soil, as the cattle fed on it render the earth firm by their trampling, and fertilize it by their manure. In consequence of this improved system, the rents of Mr. Coke's Holkham estate have risen from £2200 to above £20,000, and pauperism has been obviated to such a degree that the poor-house at Holkham has been demolished as useless. The farms are, generally, of a large size, such only allowing the employment of the great capital required for the successful cultivation of a soil naturally unproductive. The custom of letting the land lie fallow one year in three, is exploded, as its necessity is superseded by a judicious system of cropping, so that one crop may fertilize as another exhausts. The mode of cropping in general practice is popularly termed a six-course shift, viz. the first year wheat, the second barley, third turnips, fourth barley or oats, fifth clover, sixth wheat again. Wheat is a general crop over the whole County, but thrives best on the stiff, loamy lands. The lighter soils are favourable to barley, great quantities of which are raised, and sent out of the County, after having been converted into malt. Grain is generally cultivated by drilling or dibbling. The average crops of the whole County may be stated at three quarters of wheat and four of barley to the acre, and the produce of other sorts is proportioned to

Rural in-
dustry.NOR-
FOLK.

NOR-
FOLK.

this standard. The crops of inferior importance are rye, buck-wheat, peas, beans, vetches, cabbages, mangel-wurzel, lucerne, carrots, and potatoes. The turnip is by far the most important crop. A good acre will produce between thirty and forty cart-loads, and will fatten a heavy bullock or eight sheep. But the advantage does not terminate here, for it leaves the land in so fine a condition as to ensure a good crop of barley or clover, and subsequently of wheat. Kent computes that the value of the corn sent out of the County amounts annually to a million sterling. He states the value of the live stock which it sends out at £373,000. Poultry, and especially turkeys, are produced in great abundance. Rabbits multiply very fruitfully in the sandy tracts. It is computed that the annual sale of these animals amounts to £10,000.

Fisheries.

Fresh-water fish are plentiful in the numerous rivers and canals; of these, the perch is so abundant that at Ramworth, 120 bushels have been netted in a day. The sea fishery, however, is far more important. The mackerel appear on the coasts in vast shoals in Spring and Summer, and furnish the inhabitants with an abundant supply of food. Yarmouth owes its importance to the herring fishery, which commences in September, and continues about three months. In successful years, it gives employment to 200 vessels of 40 or 50 tons each, and manned, on an average, by a dozen men. 70,000 barrels have been exported in a year, while the home consumption amounted to 15,000 more. The trade affords subsistence to above 2000 fishermen, and 4000 persons employed in its departments on shore. Nearly all the fish are cured by smoking. Notwithstanding the agricultural prosperity of this County, pauperism, confined principally to the manufacturing population, is a heavy weight on its resources. In 1829, the sum levied for poor-rates amounted to £308,564. (*Parliamentary Documents*, 1830, vol. xxxi. p. 49.) Norfolk lies in the Diocese of Norwich, which extends also over the greater part of Suffolk and a portion of Cambridgeshire. It contains 802 of the parishes within the jurisdiction of the Diocese.

The chief Towns in the County are :

Attle-
borough.

Attleborough, once a place of considerable note, and still possessing a Church, the remains of a large and handsome Collegiate structure. The College itself dates from the reign of Richard II. Distant 12 miles N. E. from Thetford, 94 from London. Population, in 1831, 1939.

Aylsham.

Aylsham is a Market Town on the South bank of the Bure, which is navigable for barges. In the reigns of Edward II. and III. it maintained considerable linen manufactories, succeeded afterwards by that of woollen. Weaving and knitting are now the chief employments of the inhabitants. The Church, consisting of a nave with aisles, a chancel, transept, and square tower surmounted with a small spire, is attributed to the foundation of John of Gaunt. It is a Vicarage in the gift of the Dean and Chapter of Canterbury. The town contains a Free-school and a County Bridewell, the latter erected in 1543. Distant 9 miles from Norwich, 118 from London. Population, in 1831, 2334. *Blickling Hall*, about two miles N. W. from the town, is a venerable brick mansion, built in 1628, upon a manor once belonging to Harold, King of England, and on the site of a former house, the reputed birth-place of Anne Boleyn.

Cromer.

Cromer, a Market Town, and a favourite watering-place, stands upon a cliff of considerable height. The

coast is very dangerous, and the town is without a harbour; the bay is so formidable to mariners as to be known by the name of the Devil's Throat; and the sea, which is perpetually encroaching upon the beach, is believed to have swallowed up the Church of *Shipden*, a town which once either adjoined or was identical with Cromer. Large masses either of wall or of rock are pointed out at low tides as remains of that building. The existing Church is a handsome pointed structure, with a lofty tower. The adjoining country is picturesque, and the lobsters found on the coast are peculiarly esteemed. Distant 9 miles from Aylsham, 129 from London. Population, in 1831, 1232.

Dereham, East, or Market Dereham, is a Market Town in the centre of the County, clean and well built, with a small rivulet flowing through it. The Church, of great antiquity, with a transept and central tower, contains a monument to the Poet Cowper buried beneath it. A singularly carved oak chest, dug out of the ruins of Buckenham Castle, is employed as the receptacle of the church muniments, and on the Southern side in the churchyard is a detached Bell tower, erected in the reign of Henry VII. A richly carved font bears the date of 1468. Bishop Bonner was Rector of Dereham from 1534 to 1540; and the town has twice suffered greatly from fire, once in 1581, afterwards in 1679. Distant 16 miles N. from Norwich, 100 from London. Population, in 1831, 3946. *West Dereham*, 2 miles from Downham, 84 from London, has a fine brick gate-tower, the remains of a Præmonstratensian Abbey, founded in 1118. Population, in 1831, 496.

Diss, a Market Town on the Waveney, on the Southern borders of the County, has manufactories of hempen cloth, hose, and stays. The Church is a pointed structure with a Western tower. The town, which is neat and of flourishing appearance, is the birth-place of Radulphus de Diceto, (as the name of this town is Latinized,) Dean of St. Paul's, a Chronicler in the reign of Henry I.; and John Skelton, the reputed Laureate under Henry VII. and VIII., was Rector of the Parish. Distant 13 miles S. W. from Norwich, 91 from London. Population, in 1831, 2934.

Downham Market stands pleasantly on a hill rising from the Ouse, which is crossed by a stone bridge. The market is particularly noted for butter, which being conveyed by water-carriage to Cambridge, and thence to London, is known as Cambridge butter. Of this commodity 2000 firkins are said to have been exported in a week. Distant 11 miles S. from Lynn, 84 from London. Population, in 1831, 2198.

Fakenham, on a hill above the Yar, contains a very handsome pointed Church. Although the town is seven miles from the sea, saltpits were formerly worked in it. The Church is a Rectory in the Patronage of Trinity College, Cambridge. Distant 7 miles E. from East Dereham, 108 from London. Population, in 1831, 2085.

Holt is a handsome Market Town on rising ground, principally rebuilt with good houses since a destructive fire in 1708. It has a large Free-school, founded by Sir Thomas Gresham, a native of this town, in 1556, with a scholarship in Sidney College, Cambridge, annexed to it. The Fishmongers' Company in London are Patrons and Governors of this school. There is also in Holt a good Sessions House, and the surrounding country is very agreeable. Distant from East Dereham 18 miles N., from London, 119. Population, in 1831, 1622.

Swaffham.

Swaffham is a considerable Market Town, occupying a large space of ground in an elevated and healthy site. The Church is a noble pointed building of the reign of Henry VI., the Living a Vicarage in the Patronage of the Bishop of Norwich. Near the town is an excellent race-ground, on which, besides horse-races, coursing-matches are frequently and regularly held. Distant 15 miles S. E. from Lynn, 93 from London. Population, in 1831, 3285.

New Wal-
singham.

Walsingham, New, on the banks of a small stream, is distant about two miles from *Old Walsingham*, once celebrated for a Chapel of the Virgin, founded in 1016 by a noble widow, Ricoldie Faverches, to which an Augustan Priory and a Conventual Church were added by her son. The Lady of Walsingham was notorious for her attraction of Pilgrims, and she is described at length as *Diva Parathalassia*, by Erasmus, in his exquisite Colloquy, *Peregrinatio Religionis ergo*. The village in which she abides, he says, has scarcely any other means of support than that arising from the influx of pilgrims; and he continues at great length, and with much wit, to display the marvels contained in the Reliquaries. Considerable remains of the once magnificent Ecclesiastical buildings still exist. The Church is a fine pointed building, and contains a very noble Font. The neighbourhood of Walsingham produces rich crops of saffron. Distant 4 miles from the sea, 25 N. W. from Norwich, 117 from London. Population, in 1831, 1004.

Walton.

Walton, a small Market Town, is remarkable from its neighbourhood to Wayland, or, as it is vulgarly called *Wailing Wood*, the traditional scene of the Tragic story of the Children in the Wood, or as the second title of the Old Ballad runs, "The Norfolk Gentleman's last Will and Testament." Distant 19 miles S. W. from Norwich, 91 from London. Population, in 1831, 905.

Wymond-
ham.

Wymondham, or *Windham*, as it is abbreviated in pronunciation, is a large Market Town on the London road, once noted for a Benedictine Priory, erected in 1130, and advanced to an Abbey in 1448. The Church is a handsome pointed building; the living a Vicarage in the gift of the Bishop of Ely. The town supports many weavers, and has also considerable manufactures of wooden ware. Distant from Norwich 9 miles S. W., from London 100. Population, in 1831, 5485.

The City of NORWICH, the Boroughs CASTLE-RISING, LYNN-REGIS, THETFORD, and YARMOUTH are separately described. Other Market Towns in this County, more than the names of which scarcely demand notice, are *Buckenham*, *Foulsham*, *Harling*, *Hingham*, *Loddon*, *Methwold*, *Walsham*, and *Reepham*.

Spelman's *Icenia*, in the *Reliquiæ Spelmannianæ*, Ox. 1698; Blomefield, *History of the County of Norfolk*, 11 vols. 8vo. Lond. 1805; Marshall, *Rural Economy of Norfolk*, 2 vols. 8vo. And thei schulen come fro the eest and west, and fro the *north* and south: and schulen sitte at the mete in the rewme of God.

Wiclif. Luke, ch. xiii.

And they shall come fro the east and from the west, and from the *north* and from the southe, and shal syt downe in the kingdome of God.

Bible, Anno 1551.

Whan they were in the sea amid
Out of the *north* thei see a cloude,
The storme arose, the wyndes loude
Thei blowen many a dredefull blaste,
The welken was all ouercast.

Gower. Conf. Am. book viii. fol. 257.

And as Superstition, the daughter of Barbarism and Ignorance, so amongst those *northerly* nations, like as in America, magic was most esteemed.

Selden. Illustrations of Drayton's Poly-olbion, note 7.

Such forces met not, nor so wide a camp,
When Agrican with all his *northern* powers
Besieg'd Albracca, as romances tell.

Milton. Paradise Regained, book iii. l. 337.

The greatest declination of the sonne from the æquinoctiall towards either pole, being alwayes the same; the sonne cannot goe more southerly from vs, nor come more *northerly* towards vs, in this, than in former ages.

Hakewill. Apologie, book ii. ch. iv. sec. 4. fol. 102.

From Hamath *northward* to the Desert south
(Things by their names I call, though yet unnam'd.)

Milton. Paradise Lost, book xi. l. 139.

The *north-star*, though it be less luminous than many others, yet, by reason of its position, doth better guide the pilot, than even the moon herself.

Boyle. Works, vol. ii. p. 272. Considerations touching the Style of the Holy Scriptures.

Then wondering Arabs from the sultry line,
For ever *northward* saw the shade incline.

Rowe. Lucan, book iii.

I do spy great relief to the difficulties of the Latin etymologist, by directing his view to the *north* rather than to the east, when all his labour and toil are frustrate in the Greek.

Tooke. Diversions of Purley, vol. ii. p. 298.

The *northern* origin is totally out of sight; is intirely and completely lost in its deep antiquity.

Id. Ib. p. 270.

NORTHALLERTON, a Borough and Market Town in the North Riding of Yorkshire, situated on a rising ground near the river Wiske, in a rich and fertile country on the High North Road. It consists principally of a single, well-built street, more than half a mile in length. The Church is a pointed, cruciform structure, the market place is spacious, and the town contains a Prison and a House of Correction. It returns two Members to Parliament, and is distinguished in English

NORTH.
—
NORTH-
ALLER-
TON.

NORTH-ALLERTON. History as the spot on which was fought, in 1138, a great engagement, in which the English Barons completely defeated David, King of Scotland, who espoused the cause of his niece the Empress Matilda against the usurper Stephen. The English raised on a wheeled chariot a lofty Crucifix, decorated with the banners of

St. Peter and St. John of Beverley, and surmounted with a consecrated Host; and from that ensign, framed probably in imitation of the Lombard *carroccio*, the fight in which it was exhibited is known as the *Battle of the Standard*. Northallerton is distant from York 30 miles N. W., from London 224. Population, in 1831, 3004.

NORTH-ALLERTON.
—
NORTH-AMPTON-SHIRE.

NORTHAMPTONSHIRE.

Position,
extent, and
boundaries.

NORTHAMPTONSHIRE, a County of England, extends 66 miles from its South-Western extremity at Aynho to Crowland at its extreme North-Western point, the longest line at right angles to this reaches from Boreat Wood near Yardley to Stamford on Avon, a distance of 30 miles. Its superficial extent is 648,000 acres, or 1012 British miles. Proceeding from Aynho to Crowland, along its Western limit, we find it bounded successively by the following Counties, Oxfordshire, Warwickshire, Leicestershire, Rutlandshire, and Lincolnshire, and proceeding from Crowland along the Eastern limit to Aynho on its South-Western extremity, in like manner by Cambridgeshire, Huntingdonshire, Bedfordshire, and again by Oxfordshire. Of the 617,000 acres which it contains, 290,000 are arable, 235,000 usually employed in pasture, and 86,000 remaining nearly in a state of nature. Three royal Forests, Salcey, Whittlewood, and Rockingham, are situated in this County. Rockingham Forest, in the North-West, extends 20 miles in length, and contains about 10,000 acres, but within its limits are many open spots affording good pasturage. Geddington Chase was formerly part of this Forest until disforested by the Crown, and converted into a Chase in favour of the Montague family. Salcey Forest contains about 4000 acres, and was far more extensive before the separation of Yardley Chase, celebrated for its enormous oak, fifty-one feet in girth, and the subject of one of Cowper's most striking Poems. Whittlebury Forest is eleven miles in length, and contains about 7000 acres. All these Forests are unprofitable as public property, the salaries of officers and servants generally equalling or even exceeding the proceeds. The soil of the Forests is generally a moist, grey loam, well adapted to the growth of oak. The Great Peterborough Fen, a tract of 7000 acres in the North-East, though some of the most fertile land in the Kingdom, is inadequately productive, in consequence of the right of commonage claimed over it by the neighbouring farmers.

Aspect of
the country.

This County possesses, probably, as great natural advantages as any other in the Kingdom. The soil is fertile and well watered, the landscapes are varied, extensive, and beautiful, and adorned in general with a luxuriant growth of timber. No mountains or eminences occur possessing such a height or ruggedness of surface as might preclude cultivation; and Art, by architecture, planting, and agriculture, has given it a high degree of wealth and embellishment. The climate is very favourable to health and vegetation, the air is pure, as no ground has elevation sufficient to attract and retain foggy and unwholesome vapours. Heavy falls of snow are rare, and their duration seldom long, and from the inland position of the country the air is dry, and the rains seldom injurious to the crops.

Climate.

Though the County contains no mountains, nor any eminence exceeding 800 feet in height, it is a table land

more elevated than almost any other extensive surface in the Kingdom. Exclusively of barometrical measurements, this elevation is proved by the fact, that rivers flow both Eastward and Westward into the German Ocean and Irish Channel. The Nen rises near Catesby Rivers. in the Hundred of Fawsley, flows by Northampton and Peterborough, and passes into Cambridgeshire, at the North-Eastern extremity of which it falls into the German Ocean. The Charwell rises in the same vicinity as the Nen, and after running for several miles along the Western boundary of this County, enters Oxfordshire, where it falls into the Thames. The Avon rises near the memorable field of Naseby, and after flowing for a short distance through this County passes successively through Warwickshire, Worcestershire, and Gloucestershire, and falls into the Severn at Tewkesbury. The Welland rises in the Hundred of Rothwell, and winding along the North-Western boundary flows by Stamford, where it becomes navigable, passes into Lincolnshire, where, below Spalding, it falls into the sea. The Ouse rises in the Hundred of Sutton, and after a course of a few miles passes into Buckinghamshire. Numerous smaller streams are tributary to these, and every where afford the inhabitants the advantages of irrigation, and power applicable to corn-mills and similar mechanical contrivances. Only the Nen and the Welland are navigable in this County.

Much the greater portion of the lands of this County Soil. has a soil of strong, stiff clay, employed in the culture of beans and wheat before enclosure, and when enclosed generally laid down to permanent pasture. The uplands have a lighter soil, and are more generally employed in tillage. The surface there consists of a grey or brown loam of various tenacity, but no where approaching the sterility of sand or the harshness of clay. The understratum is most generally stone in loose fragments, sometimes so near the surface as to be brought up by the plough to the deterioration of the vegetable mould. Much of this substratum is calcareous, often pure enough to be burned into lime, but in some places largely mixed and encrusted with argillaceous and other extraneous matter. The North-Western is the least fertile part of the County, and the culture of turnips, the crop best Rural in- suited to the soil, does not receive the attention which dustry. it merits. Peterborough Fen and some other low tracts have a dark-coloured and very fertile alluvial earth. The mineral kingdom affords Northampton few remarkable or important productions. Slate quarries are worked to a considerable extent, and the blocks are divided into laminæ by a singular and ingenious process. The masses of stone are dug up in Autumn, and being placed in a position different from that which they had in the quarry, the rain insinuates itself between the layers, and in frosty weather the expansion of the water, as it freezes, splits the block into plates of a proper thick-

NORTH-
AMPTON-
SHIRE.

ness. Property is little subdivided in this County, and Young mentions thirty-seven estates of £3000 per annum and upwards each, and sixteen from £5000 to £10,000 each. The farms are of moderate extent, having an average size of from 150 to 200 acres. They are mostly held at will, and the few leases granted are for seven, fourteen, or twenty-one years, with strict covenants enforcing rotation of crops, repairs, and similar regulations, which may prevent the deterioration of the value of the land. Grazing is the most lucrative and important department of farming. According to Pitt, the number of cattle annually fattened amounts to 33,000, and the number of sheep to 250,000; much the greater proportion of this stock is sent to the London market. The horses bred in this County are of the strong black breed, and suitable either for coaches, for the cavalry service, or for heavy waggons. The farmer generally purchases them young, and after using them on his farm for two or three years, sells them for the above purposes. The number in the County is rated by Pitt at 20,000. Butter is the principal produce of the dairy, and is sent in great quantities to the London market, which also receives large supplies of veal from this County.

Canals.

Wood, from its abundance, is much used as fuel, though large quantities of coal are conveyed from Staffordshire by the Grand Junction Canal, which traverses the County for above forty miles. The level which passes through Braumston Tunnel has the extraordinary elevation of 375 feet. The Union Canal connects the Nen at Northampton with the Soar above Leicester.

Manufac-
tures.

In few Counties is a less proportion of the population engaged in manufactures than in Northamptonshire. About 1000 persons are employed in Northampton and its vicinity in making shoes. About Wellingborough, according to Pitt, 10,000 persons are engaged in making lace, but the number seems exaggerated. At Kettering about 2000 persons are employed in the woollen manufacture. According to the Census of 1831, the population is 179,276. The Poor Rates, in 1828, amounted, according to Parliamentary documents, (1829, vol. xxi. p. 100.) to £162,571.

Nor-
thampton.

Northampton, the County Town and a Borough, is of very ancient date, and appears to have been exposed to much suffering, even so early as the Danish invasions. In *Domesday Book* no more than forty Burgesses of the town are recorded, although in 1064 there existed sixty. The town, with the whole Hundred of Falkely, (Fawsley,) then valued at £40 a year, was given by the Conqueror to a Norman retainer, St. Liz, to provide shoes for his horses. Many of the following Kings kept their Court during some of the great festivals in this town, and we read of Councils also and Ecclesiastical Synods assembled in it. During the reign of Henry III., owing to some discontents both in Oxford and Cambridge, the students resorted to Northampton, and formed there a third University, which at first received the countenance of the King; but when the rebels against *Alma Mater* disregarded the Royal authority, and sided with the Barons, they received peremptory orders to return to the Seats of Learning which they had deserted. The last Parliament held in Northampton was that in 4 Richard II., noted for having levied that poll-tax, which occasioned Wat Tyler's rebellion. In the Wars of the Roses, a great battle was fought in its neighbourhood, in 1463, in which Henry VI. was taken prisoner. During the Great Rebellion it was seized and occupied

by the Parliamentary forces, the remains of some of whose fortifications may still be traced in the North-Eastern quarter. In 1675, a most destructive fire consumed the greater part of the town; between 600 and 700 dwelling-houses were burned, and the loss of property was estimated at £150,000; and although the subscription raised for the sufferers after the memorable fire of London amounted but to £18,000, more than £20,000 was collected on this occasion by private benevolence.

NORTH-
AMPTON-
SHIRE.

The town stands on an eminence on the bank of the river Nen or Nine, and is a great thoroughfare both on the Northern and Western roads; the streets are regular, and the houses for the most part uniformly built of free-stone and slated. Of its Walls and Castle there are now but scanty remains, and of its former seven Churches and three Chapels of ease, only four exist. That of All Saints, a Rectory in the gift of the Corporation, a motley edifice, rebuilt after the fire in 1675, violating all rules of architecture, and faced with a slice of Ionic portico, stands nearly in the centre of the town. St. Giles's is a large pointed building closely adjoining the ancient wall. St. Peter's, in the West of the town, near the site of the Castle, is probably of Norman origin, and a very interesting specimen of that style; the great Western arch of the tower in the interior is very elaborately worked; the font is of the time of Edward I. St. Sepulchre's is one of the four Round Churches (the others are the Temple, London, the Holy Sepulchre, Cambridge, and the Church at Little Mapledsted, Essex) built by the Templars on the model of that at Jerusalem. A square Western tower, and a nave and aisles on the East, are later additions. Of the destroyed Ecclesiastical buildings, St. Bartholomew's stood without the North gate, in a field now known as Lawless (Lawrence?) Close; it was in ruins in the time of Leland. St. Edmund's, immediately without the Eastern gate, was standing in the time of Henry VIII. St. Gregory's, near St. Peter's, was granted in 1577 for a Grammar School. In St. Mary's Street, Eastward from the Castle, was a Church of the Blessed Virgin, and in Cock Lane once stood St. Michael's. Besides the Churches there were numerous Monastic Establishments; and two Hospitals, still existing, for the support of alms-men, that of St. John founded in 1168, that of St. Thomas in 1450.

Among the modern buildings is an extensive General Infirmary, opened in 1793, a handsome Sessions House, and Town and County Gaols. The principal street, called the *Drapery*, is terminated by a noble square, *Woodhill*, employed as a market place; that for horses being considered the finest in England. Northampton has returned two Members to Parliament since the reign of Edward I.; it gives the title of Marquess to the family of Compton. During the Revolutionary war with France, from its central situation, it was considered a very eligible spot for prisoners of war on their *parole*. About one mile and a half on the London road stands one of the Crosses erected by Edward I. in commemoration of Queen Eleanor. Northampton has produced few native worthies: the ambiguous and servile Bishop of Oxford, Samuel Parker, is one; Samuel Fisher, a crazy enthusiast during the Great Rebellion, by turns a Puritan, an Anabaptist, and a Quaker, is a second; and the equally crazy Robert Brown, founder of the intemperate Sect which bears his name, and whose chief pride seems to have been that he could boast of committal to thirty-two prisons, completes the trium-

NORTH-AMPTONSHIRE. virate. We know not whether the town had the honour of giving birth to an Ecclesiastic of widely different character, but the pious and justly respectable Doddridge officiated in it to the Independents during twenty-two years; he died at Lisbon in 1751, and a tablet in his own Chapel records his memory. The manufactures of Northampton are shoes, stockings, and lace. The population, which in 1801 was only 7020, had increased in 1821 to 10,793, and by the census of 1831 is 15,351. Distant from Newport Pagnell 15 miles S. E.; from London 65½ miles N. W.

BRACKLEY, HIGHAM FERRERS, and PETERBOROUGH are separately described.

Brington.

Brington is a small village with a handsome pointed Church, annexed to which is a monumental Chapel decorated with many tombs of members of the Spencer family, the oldest bearing date 1522. Distant 6 miles N. W. from Northampton, 71 from London. Population, in 1831, 887. About a mile N. W. from the village stands *Althorpe*, the seat of Earl Spencer, built by the Earl of Sunderland in 1688, a large edifice, occupying three sides of a quadrangle, but without pretension to architectural beauty. The Park is richly timbered, and finely varied in elevation. The Gallery contains many noble Pictures, and the Library is celebrated as the most choice private collection in England.

Daventry.

Daventry is a Market Town seated on a hill near the sources of the Avon and the Nen, which fall into opposite seas, and almost encompassed by other hills. A Clugniac Priory was founded in it in 1090, of which the Refectory still exists. The town is a Borough by a Charter of John, renewed by Elizabeth. It is dirty and ill built; its chief manufacture is that of whips. About half a mile to the South, on Borough Hill, or Danes' Hill, is a remarkably strong encampment, with many vestiges of buildings, attributed variously by antiquaries to the Britons, Romans, Danes, and Saxons. The spot was occupied by the Royal army before the fatal Battle of Naseby. Distant 12 miles N. W. from Towcester, 72 from London. Population, in 1831, including the Hamlet of Drayton, 3646.

Fotheringay.

Fotheringay, a small village on the river Nen, is distinguished for its Castle, erected soon after the Conquest, and rebuilt by Edmund Langley Duke of York, son of Edward III. The keep was in the shape of a fetterlock, the device of the House of York. It was the birth-place of Richard III., the last prison and the scene of the execution of Mary Queen of Scotland; and in consequence of that bloody deed it was razed to the ground on the accession of James I. Some remains of a very ancient Nunnery, transformed by Edward Duke of York into a College for Seculars, still exist, and in the Conventual Church, the body of that Prince, killed at Agincourt, and also that of Richard Duke of York, who fell at Wakefield, lie buried. Distant 10 miles from Stamford, 85 from London. Population, in 1831, 280.

Kettering.

Kettering is a Market Town on a rising ground near a rivulet flowing into the Nen. The houses for the most part are mean and ill-built, and many of them thatched. It has manufactures connected with various process of wool-combing and weaving. The Church is of pointed architecture, with a handsome tower and spire. Distant from Wellingborough 6 miles N., from London 75. Population, in 1831, 4099.

Naseby.

Naseby, a small village, is reputed to stand on the

highest ground in England, but that assertion is disputed by other places in the County, especially by *Staverton*. The battle in which Charles I. finally lost his Crown, was fought in a field adjoining the village. It was once a Market Town, chartered by John, and the Cross still remains. Distant 12 miles N. W. from Northampton, 77 from London. Population, in 1831, 707.

Oundle is a neatly built Market Town on the Northern bank of the Nen, by the winding course of which it is almost surrounded. Its pointed Church has a lofty Western tower. The river is crossed by two bridges. Distant 16 miles S. from Stamford, 77 from London. Population, in 1831, including the Hamlet of Aston, 2430.

Rockingham, now a decayed Market Town, stands on the river Welland, and once had a Castle built by the Conqueror, which was the occasional residence of our Kings till the reign of Edward III., and during the Great Rebellion was occupied for Charles I. by Sir Louis Watson, created Baron Rockingham in 1644. Little now remains of it, and on its site is a mansion belonging to Lord Sondes. Great part of the Church was destroyed while the forces of the Parliament besieged the Castle. The Forest of Rockingham was anciently one of the largest in the Kingdom. In Edward I.'s time it is described as extending 30 miles in length, with an average breadth of 8 miles. In a survey, so late as 1641, its extent was 14 miles by 5, and it was noted for its iron works. Rockingham is distant 83 miles N. from London. Population, in 1831, 296.

Towcester is a considerable Market Town on the River Weedon, which is crossed by three bridges. Horsley conjectures that it stands on the site of the Roman Station Lactodoro, on the Watling Street which passes through the town. On the North-Western side are vestiges of a fosse and castle, supposed to be Saxon. The single street of which it mainly consists is well built, and abounds in inns. An Hospital and Chantry were founded in this town in the reign of Henry VI. by William Sponne, Archdeacon of Norfolk, and Rector of this Parish, whose arms still decorate the windows of the Talbot Inn, once his property. Silk and lace are manufactured here. It is the birth-place of Empson, the associate of Dudley in the favour of Henry VII. His father was a sieve-maker; and he himself became Chancellor of the Duchy of Lancaster, and was beheaded at Northampton in 1510. Distant 7 miles S. W. from Northampton, 60 from London. Population, in 1831, including the Hamlets of Caldicote, Handley, and Wood-Burcott, 2671.

Wellingborough, a Market Town, probably derives its name from Redwell, a mineral spring in the neighbourhood: it stands on the side of a hill, sloping to the river Nen, and is clean and neatly built, mostly since a great fire in 1738. The Church is a large and handsome pointed building. The chief trade is in corn. Distant 7 miles N. E. from Northampton, 68 from London. Population, in 1831, 4688.

Bridges and Whalley, *History and Antiquities of Northamptonshire*, 2 vols. fol. Oxford, 1791; Donaldson, *View of the Agriculture of Northampton*, 4to. Edinburgh, 1794; Pitt, *General View of the Agriculture of the County of Northampton*, 8vo. London, 1809.

NORTHUMBERLAND.

**NORTH-
UMBER-
LAND.**

Position,
boundaries,
and extent.
Sea-coast.

NORTHUMBERLAND, an English County, is bounded on the North by Scotland and part of the County of Durham, East by the German Ocean, South by the County of Durham, and West by Cumberland. It is 60 miles long, 47 broad, and contains 1809 square British miles, or 1,157,760 acres.

Budle Bay, the Northern limit of the sea-coast of Northumberland, is an inlet with a sandy bottom, admitting vessels drawing seven feet of water, well known for the abundance and excellence of its shell-fish. The cliffs to the South are regarded as basaltic, and on a steep rock of that formation is seated Bamborough Castle, which rears its quadrangular and massive walls to the height of 150 feet. Opposite to this, and separated from it by a channel of about a mile in width, are the Fairn Islands, seventeen in number, but so small and barren, that in Pennant's time they were rented but for £16, a charge liquidated by the tenant from the sale of kelp and of the feathers of sea-fowl. At Dunstanborough the line of coast consists of whinstone rocks, striking from their heights, their rough and precipitous character, and the violence with which the surge breaks against them. The ruins of Dunstanborough Castle are situated on a cliff of that formation, over which they extend so far as to cover an area of nine acres. The estuary of the Coquet forms a small harbour capable of admitting square-rigged vessels, and defended from the violence of the sea, rolling in from the East, by the Isle of Coquet, a fertile spot, but having an area of only seven acres. The mouth of the river Blyth at a short distance to the South forms a good haven, much frequented by shipping since the opening of the Cowpen Colliery; as many as forty have sailed in a single tide. A few works of no great expense or complexity, might render it one of the best havens in this part of the Kingdom. The coast here, and in general Southward as far as Tynemouth, consists of clay mingled with gravel, and in many places encroached on by the violence of the waves. Numerous rocks and small islands fringe the coast, and are probably fragments of land overwhelmed by the sea. The mouth of the small river Seaton by the construction of flood-gates, which have caused the place to be called Seaton Sluice, has been rendered capable of containing twelve or fourteen square-rigged vessels. Opposite this haven lies the small Island of St. Mary. The estuary of the Tyne has to the North a peninsula of stupendous rocks. The Benedictines, with that taste so often exhibited by cenobites in the selection of their retreats, erected a spacious and beautiful monastery on this noble site. By a revolution of no uncommon occurrence, this mansion of peace has been converted to military purposes, as the ruins have been rudely repaired, and made a storehouse for ammunition. The mouth of the Tyne, about 500 yards wide, is guarded by two forts, one situated on each bank. The channel expands as it recedes from the sea, and forms a haven capable of containing 2500 ships of 500 tons burden. Spring tides rise 18 feet at the mouth of the river.

Mountains.

The Western part of the County is overspread with

mountains, among which the Cheviot Hills, forming the boundary on the side of Roxburghshire, attain the height of 2680 feet. Notwithstanding this elevation, the Cheviot Hills are in general remarkably fertile, presenting, with the exception of their summits, a uniform coat of green-sward affording excellent pasture for sheep. As the ground has a declivity to the level tract on the shore, the rivers generally flow in that direction. Those mountains are formed of granite and whinstone, and are computed to extend over a surface of 90,000 acres. Eastward of Cheviot another range of mountains rises in the vicinity of Rothbury. They are a bleak, unproductive tract, covered with heaths or morasses; among them Simonside Hill rises to the height of 1407 feet. A third group lies to the South of Hexham, and resembles the second in aspect and quality of soil. The soil of the level tract extending along the coast, is in general clay, of which the greater part is productive, though in many places it degenerates to a cold and barren nature. In the Northern part, as we recede from the sea, the soil is gravelly, but highly cultivated, and the central part, about Ilderton, is considered not inferior to any agricultural district in Britain. The tract between the upper part of the rivers Wansbeck and Tyne, is of a cold, clayey nature, retentive of moisture, and unproductive. The Valley of Hexham, including South Tyne as far as Haltwhistle, and North Tyne as far as Bellingham, is a fine loam. The harvests in this valley are the earliest, its trees have the richest foliage, and its landscape the most picturesque scenery, any where occurring in Northumberland.

Cold and violent Easterly winds sometimes produce very unfavourable effects on the climate, and so retard vegetation, that the trees occasionally are as leafless at the beginning of May as in December; but when these nipping gales are succeeded by the moist and mild winds from the West, luxuriant foliage clothes every branch in the course of a few days. The Westerly winds usually bring rain, and in harvest sometimes blow with such violence as to cause the crops to shed. Autumn is, however, the mildest and most agreeable period of the year. Winter is very severe, and snow falls heavily, and lies long on the high grounds.

The main stream of the Tyne is formed by the union of the North and South Tyne. The North Tyne rises near the borders of Scotland, receives the Reed near Bellingham, and is joined by the South Tyne near Nether Warden. The united streams are subsequently swelled by the Dill and the Derwent, and after a course of about eighty miles fall into the German Ocean at the Southern extremity of the County. The Tweed can scarcely be considered to belong to this County, as it forms the boundary line between Scotland and an isolated part of the County of Durham. The Aln, the Coquet, the Wans, and the Blyth, flow in the same direction, rising in the Western hills, and falling into the German Ocean. Thirteen small lakes are dispersed over the County, but possess no circumstances requiring especial notice.

Northumberland is very rich in mineral deposits. A rich lead mine is worked at Sheldon, near Corbridge;

Mines.

NORTH-
UMBER-
LAND.

another, at Fallowfield, near Hexham formerly afforded large quantities of very rich ore, but is now inaccessible in consequence of the accumulation of water in its shafts. The most valuable deposits of this mineral are in the Southern part of the County, about the upper parts of the South Tyne. About 7000 tons are annually extracted from these mines, and sold at a sum varying from £170,000 to £190,000. The ore of some mines has yielded from 20 to 30 ounces of silver per ton. Deposits of iron-ore exist in great abundance. That worked with most activity and success lies at Belesworth, on the South bank of the Blyth, and about four miles from its port. Much of the iron raised in this County is taken off by the Carron Company. Copper-ore has been found in many places, but not in sufficient abundance or richness to allow profitable extraction. The coal district has the form of a trapezium, of which the Northern apex is situated near the mouth of the Coquet, the Southern on the banks of the Tees. The strata of coal are spread out in immense layers along the bottom and sides of a vast basin, of which the deepest part is at the village of Jarrow. There, the high main, or principal seam of coal, lies at the depth of 900 feet, and rises thence on every side, so that it appears at the surface at certain distances all round Jarrow, while the strata under which it lies buried successively appear at certain other distances from Jarrow, thus forming larger and larger circuits round it in proportion to their depth. The strata are often interrupted by great fissures or dislocations; of these the most remarkable is the ninety-fathom dike, where the strata on the Southern side are elevated more than 500 feet above those on the Northern side. The thickness of the strata of coal and of intervening matter varies greatly: at St. Anton's Colliery, for instance, 34 yards must be dug before reaching the highest seam or stratum of coal only 6 inches thick; 7 strata intervene between this and the high-main seam 6 feet thick, and 152 yards below the surface; and 6 more intervene between this and the low-main seam, 6 feet 6 inches thick, and about 900 feet below the surface. The total thickness of the various seams in this colliery amounts to 22 feet.

The area occupied by the coal basin is calculated at about 300 square miles, and the cubic dimensions of the coal throughout its extent at 5,500,000,000 of cubic yards; and as 4,000,000 of cubic yards have been conjectured as the annual rate of extraction, it is computed that those fields will, at the present rate of consumption, afford a supply for above a thousand years. The quantity of coal shipped from the Tyne (*Minutes of Evidence on the Coal Trade, Parliamentary Documents, 1830, vol. viii. p. 127, and 52—54*) has in one year, e.g. 1828, amounted to 1,430,000 chaldrons, the capital employed to £1,500,000; the number of workmen employed in mining operations 12,000, and in the collateral branches of the business as pitmen, &c. 23,000 men. It is computed that the internal consumption of the County exceeds 500,000 chaldrons, and this conclusion swells the whole amount of the quantity extracted annually to 2,000,000 chaldrons.

Rural in-
dustry.

The estates of this County are in general large, varying in some instances from £10,000 to £40,000 per annum. The farms are of corresponding magnitude, many being held under rents exceeding £2000 per annum. Those who farm on this great scale possess a large capital, and are distinguished for enterprising spirit in their agricultural operations, and independence of

character in their political and social relations. Grazing is one of the principal branches of farming. Horned cattle usually are the stock on the heavy, rich lands along the sea-coast. The cattle are bought in May or June, and sold as they become ready to supply the large fleets of colliers and other trading-vessels belonging to the sea-ports. This demand is greatest in June, and it is the object of the farmer, by the use of turnips and similar artificial food, to have his stock ready for market at that time. The dairy is neglected, except by farmers of small capital, who direct their attention to the supply of Newcastle and other towns. In the Western and more elevated tract, where the soil is light and the surface irregular, sheep are the principal stock. The kind most esteemed is a mixed breed, produced by crossing the hardy and small variety indigenous to the Cheviot Hills with the long-woolled and heavy species. This department of farming requires much attention and management, as the severity of the climate and wetness of many sheep-walks produces rot, which destroys great quantities of the stock. The horses most in use are brought from Clydesdale in Scotland. They are a strong, hardy, active race, usually 15 or 16 hands high.

A breed of horned cattle has from time immemorial been allowed to range at large in Chillingham Park, belonging to the Earl of Tankerville. As they have never been trained to the purposes of the dairy or draught, they are as wild and ferocious as the Bison of Missouri. Their colour is invariably white, except the muzzle and the points of the horns, which are black, and the tips and inside of the ears, which are red. The bulls have a fine upright mane, about two inches long. Their weight when full grown and fat, is from 35 to 45 stone. The beef is of excellent flavour. As they are very vicious, and cannot be approached without danger, they are, when required for the table, brought down by a rifle-shot.

Wild cattle.

The principal crops are wheat, barley, potatoes, turnips, and beans. The most skilful cultivators use the following rotation according to the soil, situation, and circumstances. On clayey soils fallow, wheat, clover, for one or two years beans or peas. On dry, strong loams, turnips, barley, clover, and grass, for two or three years oats, beans, or peas, and wheat. On sandy soils, or dry, light loams, oats, turnips, barley, or wheat, and then grass for two or three years.

Crops.

The manufactories of this great and opulent County are not very numerous, neither do they employ extensive capital. The conversion of small coal into coke is conducted to a considerable extent, and in the course of the process, mineral tar is obtained, which has many qualities rendering it superior to the vegetable; amongst these one of the most important is its effects in repelling the attacks of worms and other animals injurious to wood-work. Glass is by far the most important product of the manufacturing industry of the County. This manufacture, introduced about the year 1620, now produces various articles, to the amount of £500,000 annually, or nearly a third of all made in Britain. The produce consists principally of the coarser kinds of glass ware. Considerable iron-works are established in the vicinity of Newcastle, and work up not only the ores of the neighbourhood, but those imported from Yorkshire. Bricks and tiles are made in large quantities, both for home use and exportation. Less important branches of manufacturing industry are potteries, copperas-works, tanneries, and establishments for the manufacture of cottons and

woollens. Ship-building employs many hands on the Tyne, and the vessels there built are much esteemed by seamen for their strength and swift sailing.

Northumberland is divided into the six following wards. Tindale, Morpeth, Castle, Glendale, Bamborough, and Coquetdale. It forms part of the Diocese of Durham, and in that jurisdiction is styled the Archdeaconry of Northumberland, which is divided into the Deaneries of Newcastle, Corbridge, Bamborough, Alnwick, and Morpeth. The Churches of Hexham, Allandale, and St. John Lee, with their respective Chapels, are Peculiars of the See of York, and Throckington is a Peculiar of the Church of York.

The population, according to the Census of 1831, amounts to 222,912. The annual income liable to the Property tax, amounted in 1815 to £1,239,613, on which was assessed, in 1825, the moderate rate of £67,218 for the relief of the poor. The labouring population may be divided into three classes: the pastoral inhabitants of the mountain districts, who are very rude and simple in their manners; the peasantry of the low lands, who are a specimen of the primitive and prosperous countryman of England, at a time when the agricultural interest of the Country was in its meridian; and the colliers and keelmen of the Tyne, a race of wonderful robustness of frame, and great roughness of character, yet not in general lawless or demoralized, but very impatient of privation, or any diminution of their habitual enjoyments: all these classes exhibit in character and manner many evidences of their Danish descent, and incessant collision with their Scottish neighbours.

The Roman Wall of Hadrian runs nearly parallel to the South Tyne, from its estuary below Newcastle, and crosses the Western boundary of the County at Harris on the river Irthing. A military road extends for a considerable way along its Southern side, and the great military road called Watling Street, runs nearly at right angles to this, crossing the Tyne at Corbridge, a little to the North of which it divaricates into two lines, separating widely to the East and to the West. In such places as have been sufficiently preserved to give an adequate idea of its original dimensions, the wall is found to be nine feet broad, fifteen high, and to consist of rubble-stone, faced on each side with cut stone. The importance of this territory in consequence of its fertility, its roadsteads, and geographical position, have caused it to be overspread with numerous and extensive remains of antiquity, referable to various eras of English History, but presenting a topic altogether too extended for the limits of this brief notice.

The Romans, on their invasion, found Northumberland possessed by the Tribe of Britains named *Ottadini*, and under the conduct of Agricola they achieved its conquest at the close of the Ist Century. After a long conflict, and various alternations in victory, it was totally overrun by the Picts and Scots in the middle of the Vth Century. They in turn were obliged to yield to the superior prowess and skill of the Saxons; and in 547 Ida, a Saxon adventurer, united all the territory North of the Humber into the Kingdom of Northumberland. At the beginning of the IXth Century, Egbert made himself master of Northumberland, and incorporated it into his Kingdom. Between his reign and the Norman Conquest, it was at short intervals the scene of many cruel ravages by the Danes, who nearly extirpated the Saxon population, and colonized the country. William I., by the most violent and ruinous military opera-

tions, extended his unresisted dominion over the whole country, except Tindale and Reedsdale, whose predatory population maintained an obscure and precarious independence, until the progress of civilization rendered them peaceable subjects of the English Crown.

ALNWICK, BAMBOROUGH, BERWICK UPON TWEED, HOLY ISLAND, MORPETH, and NEWCASTLE UPON TYNE are separately described.

Corbridge is a Market Town, in a rich plain on the Northern bank of the Tyne, over which there is a bridge. Numerous Roman antiquities have been found in it, and among them an altar dedicated to Hercules. It once was a Borough, and returned two Members to Parliament, and from Leland's description of the remains of foundations which he saw, must have been of very considerable extent. It is believed to have possessed five Churches, only one of which now remains; near it is an old tower, which Camden calls "a little turret built and inhabited by the Vicars," but which was at one time used as the Town Gaol. *Corchester*, a Roman station, stands half a mile Westward, at the confluence of the Cor with the Tyne. Many antiquities, dug from the remains, are preserved among the neighbours, and remains of foundations and of a bridge may be traced. Corbridge is distant 4 miles E. from Hexham, 227 from London. Population of all the Townships, in 1831, 2101.

Hexham is a Market Town on the Southern bank of the Tyne, consisting for the most part of two long, narrow, ill-built streets, crossing each other at right angles. It was a Roman station. The foundations of its very noble Church were laid by St. Wilfred, Archbishop of York, so early as A. D. 674, when he erected the town, then called Hestoldesham, or Hagusteld, into an Episcopal See. The present building, however, dates from the reigns of Henry I. and II. It is cruciform, with a central tower; but the nave was burned by the Scots in 1296, and there are no remains of it but a shattered Western entrance, and part of the Southern wall. The Choir is used as the Parochial Church, and its original, beautiful pointed work has been grievously deformed by clumsy modern pews and galleries. It has an entrance screen adorned with ancient Paintings, among which is a Dance of Death; and full length portraits of St. Wilfred and other benefactors exist on the walls of the transept. Among the tombs one is shown as that of Alfwald, King of Northumberland, slain in 788. A rich oratory; three stalls on the South of the altar, (two more, alas! have been cut away,) finely ornamented with tabernacle work; the *Frid-stool*, or seat of Sanctuary, a stone chair against a pillar on the North of the altar; the shrine of the Holy Relics, a room of large dimensions at the back of the altar; the remains of a Priory at the Western end of the Church; a crypt in which some Roman inscriptions have been found; and two towers within the circuit of the Monastery, one of which is still used as a Sessions-House, the other was once employed as a Gaol, are among the many interesting relics of antiquity connected with the Ecclesiastical buildings. Leather, gloves, and hats are manufactured here. Hexham is distinguished as the scene of the decisive battle in 1461, which completed the ruin of the Lancastrians, when Nevil Lord Montacute, afterwards created Earl of Northumberland, defeated the Duke of Somerset. Linhills, on the Southern bank of Devil's Water, is pointed out as the field of battle, and *Duxfield* and *Queen's Cave*, spots adjoining it, bear their names from the capture of the unhappy Duke of Somerset, who was

NOR-WAY.

North Shields.

North Shields is a considerable town, in part consisting of a long, dark, narrow alley, on the bank of the Tyne, full of dirt and confusion; the modern streets are handsomely built. Two light-houses and a fort are placed at the entrance of the river. The coal trade is the staple of the town, and between 400 and 500 vessels are annually laden in its port. Distant 8 miles E. from Newcastle, 232 from London. The population affords one of the few instances of diminution at the recent Census: in 1801, it was 7280; in 1811, 7699; in 1821, 8205; in 1831, 6744.

Belford, Ovingham, Rothbury, and Stamfordham, are also Market Towns in this County; but they demand little notice.

NORTH-UMBERLAND.

NOR-WAY.

N O R W A Y.

Position, extent and boundaries.

NORWAY (called by the natives Norge or Norryke) is an extensive division of the great Scandinavian Peninsula. It lies between 58° and 71° North latitude, and between 4° 50' and 32° 30' East longitude. A curve drawn from North to South, and little deviating from a right line, measures 1050 miles, and the greatest conjugate to this measures 250 miles. The superficial extent is 126,000 square British miles. It is bounded on the West and North by the Northern Ocean, on the East by Russia and Sweden, and on the South by the Skager Rack.

Sea-coast.

Its sea-coast, 1600 miles in length, is singularly rocky and precipitous, and indented by innumerable fiords or inlets. At the South-Eastern extremity, the spacious inlet Christiania Fiord extends 50 miles up the country, and at its head forms the haven of Christiania. The coast, as we proceed Westward, for 150 miles is rugged and precipitous. At the part at which the Skager Rack expands into the German Ocean, it has a character similar to that of the opposite shore of Denmark, being low, covered with pebbles, and in some places rendered dangerous to shipping by banks extending into the sea. To the North of this tract the sea penetrates the iron-bound coast in innumerable rocky inlets, some of which exceed 80 miles in length, and are so winding and narrow as to resemble rivers, though the water is as salt as that of the Ocean. The traveller surrounded by hills, and as he supposes remote from any communication with the sea, is sometimes surprised by the view of large vessels sailing through those narrow channels. Numerous small islands scattered along the coast increase the intricacy and danger of the navigation. A little Northward of the Arctic circle the coast becomes still more indented and irregular, being fringed with innumerable islands, of which the principal group bears the name of Loffoden; the greater number are scarcely known by name or character, except to the fishermen frequenting the labyrinth of channels intersecting them.

Maelstrom.

The Maelstrom, (mill-stream,) between the Islands Mosker and Warae, is a current of tremendous violence formed by the ebbing tide struggling through the narrow channel. When this race is obstructed by a gale from the North-West it forms a prodigious cataract engulfing and destroying shipping and even fish within the indraught of its current. At those times its roar can be heard many leagues at sea. During high and low water in calm weather, shipping may without danger

pass this channel. The North Cape and Nordkyn, the Northern headlands of Norway, are bold and lofty rocks of granite, well suited for braving the storms and surge of the Arctic Ocean.

Norway is one of the most mountainous Countries in the World. The great range, which runs through nearly its whole length from North to South, divides it from Sweden; divaricates in latitude 63° into two ridges, of which one under the name of Dovrefield, proceeds Westward; and, at the distance of 120 miles, assumes a Southern direction, enclosing the spacious tract of Sondenfield between its Eastern declivity and the main range. The great tract lying between the Northern Ocean and the Western declivity of these ranges is called Nordenfeld, and though the surface is infinitely diversified by lateral ridges, it has a general slope towards the shore. The appearance of the country is in general very striking and picturesque, presenting mountains covered with perpetual snow, or clothed in vast and luxuriant forests, interspersed with cultivated valleys, through which roaring torrents hold their course. Extensive glaciers occur in some places, and vast morasses disfigure the lower part of the country. The greater part of the surface is stony or gravelly, unfit for agricultural purposes, and covered with firs, birch, and other hardy species of timber. The productive tracts for the most part have a basis of limestone, or consist of loam. The soil in general is far more level and fertile in the Southern than in the Northern part.

The great range of mountains has received no general name, being called differently in different parts. The most elevated summit is the Schneehatten, in the Dovrefield range; it is 7620 feet high; none of the others reach the height of 5000 feet, and few exceed 3000. They for the most part consist of granite, and other rocks of primitive formation.

As the base of the mountains is no where distant from the sea, the rivers have short courses, with rapid declivities, down which a great body of water rushes impetuously, forming many cataracts. The Glommen, the largest of those streams, has its rise in the Dovrefield, from a lake called the Oresundsee, and having in a rapid course of 220 miles formed above twenty cataracts, enters the Skager Rack below Frederickstadt. The Drammen has a course nearly parallel to that of the Glommen, and distant from it about 40 miles. It is about 100 miles in length, and discharges the water of

Mountains.

Rivers.

NOR-
WAY.

Lakes.

Climate.

Randsfiord, and of many other small lakes, into the Skager Rack. The Tana, an Arctic river, springs from the lake of the same name, and after a course of 150 miles, during the greater part of which it forms the boundary between the Swedish and Russian dominions, falls into the Northern Ocean. All the numerous streams which flow from the Western declivities of the mountains into the Northern Ocean, have much similarity of character in their short and rapid courses, in the ruggedness of their channels, and in the large body of water which they discharge. None of them require particular notice. Though the surface of Norway is singularly uneven, and its climate rainy, it is by no means comparable with Sweden in the number and extent of its lakes. Miosen, the largest lake, is in the Province of Aggerhuus, and discharges its water into the Glommen. It is 50 miles long, but very narrow, in few places exceeding eight miles in breadth. Fæmund lake, Eastward of Miosen, is 30 miles long, and eight miles broad. None of the other numerous lakes present any circumstances worthy of a particular notice.

Norway, sheltered by its mountains from the chilling winds blowing over the frozen continent to the East, and open in its whole length to the mild breezes of the Ocean, has a climate less inclement than that of any other Country in the same latitude. At Christiania, in latitude $59^{\circ} 55'$, though the Winters are so severe as to close up the harbours with ice from the beginning of December to the middle of April, the warmth of the Summer is sufficient for the successful cultivation of all the esculents and most of the fruits produced in England. The breaking up of the ice in April is immediately succeeded by a considerable degree of warmth, producing a rapid and luxuriant vegetation, so that May is completely a Summer month. The thermometer at the end of that month usually stands at 70° Fahrenheit in mid-day, and in July sometimes rises to 86° . At the celebrated copper mine of Roraas, the cold, in consequence of the elevated and inland situation, is intense, and causes the mercury to freeze in the thermometer. At Drontheim, on the sea-coast, in latitude $63^{\circ} 25'$, the severest cold causes the thermometer to fall to six or eight degrees below zero of Fahrenheit. The Summer there, however, is so warm that barley is reaped six weeks after having been sown, and two crops are often obtained successively in the same season. Clarke mentions that he found the heat oppressive at the beginning of October. In sheltered spots in the vicinity of the North Cape, the ice breaks up in the middle of May, pasturage commences in the beginning of June, hay-making takes place at the end of July, and is succeeded by harvest at the end of August. The Winter sets in early in September and covers the earth with snow to the depth of five or six feet. Yet even the vegetation is more active than in any other Country under the same latitude. A stunted growth of birch clothes the North Cape, and in latitude 70° , the shores of Altenfiord, sheltered by the neighbouring mountains, exhibit an extensive and thriving forest of pines. Here also the more hardy sorts of Cerealia are cultivated in a higher latitude than in any other part of the World. The climate is in general remarkably salubrious and favourable to longevity, nor is the excessive use of ardent spirit found deleterious. The Laplanders are extravagantly addicted to intoxication, and, when an opportunity occurs, will reduce themselves to beggary to obtain a debauch of a

few days. Yet both they and the Norwegian peasants can endure the extreme cold without the aid of any such stimulant, using milk as their ordinary beverage.

The elk, which inhabits those parts of Norway South of the Arctic circle, is the most striking and important subject of native zoology. It grows to the height of between six and seven feet, is easily domesticated, and unites the strength of the ox with the speed of the horse. Such is its fleetness according to Brooke, that when urged to its utmost powers by the couriers of the Government, it has been known to run 220 miles in twenty-four hours. The rein deer, which is as essential to the population of Arctic Scandinavia as the camel to the Arabians, occurs every where above the Arctic circle, both in the wild and domesticated state. Even the dreary Island of Mageroe, the most Northern part of Europe, has numerous herds of this creature. Their milk, which forms a considerable article of diet to the Laplanders, is very rich and luscious, but difficult of digestion, unless diluted with water. Their flesh is excellent, and their skins, covered with a long fur of wonderful closeness and warmth, affords a garment well suited to the inclemency of the climate. Its exquisite sense of smell enables it to discover the *Lichen rangiferus*, its favourite food, many feet below the surface of the snow, which is quickly excavated by its fore hoofs, and the provender thus laboriously procured, keeps it plump and in good condition during the Winter months. Such is its speed, that it trots ten miles an hour with ease, and will travel 150 miles in twenty-four hours. A wealthy family sometimes possesses a stock of many thousand rein deer; five hundred supply a family with competence, but one hundred are scarcely adequate to afford a miserable livelihood. Bears are numerous, and sometimes very troublesome to the farmers, whose eager pursuit of such mischievous enemies is quickened by the prospect of obtaining their skin, which is sold at a high price, and their flesh, which when smoked is eaten raw as a great delicacy. The bear is generally most dangerous at the approach of Winter; it then seizes on a horse or cow, and after gorging on its flesh, retires to some cavern, where it dozes until the return of Spring. The Laplanders imagine that it possesses reasoning faculties, and often in their attacks address to it reproaches or remonstrances. Wolves and foxes are numerous, but the most mischievous beast of prey is the lynx, or goube, of which there are three varieties, the wolf-goube, the fox-goube, of inferior size, and the cat-goube, still less. A single goube will sometimes in one night destroy a whole herd, of which it merely sucks the blood. The glutton is sometimes found in the least frequented forests. Of winged game the most remarkable is the cock-of-the-woods, (*Tetrao urogallus*), which attains the weight of fourteen pounds. Ptarmigans are killed in vast numbers during the Winter, and form an important article of diet in some places. The osprey is destructive, not only to sheep and poultry, but to horned cattle. According to the account of the accurate Von Buch, an osprey will sometimes immerse itself in the shallow water of the sea, and having gathered sand and small pebbles on its wings, will alight on the head of a cow, which it blinds by shaking the sea water and gravel on its eyes, and terrifies by its screams and the flapping of its wings, until the distracted animal rushes wildly amongst the rocks, and dashes itself to pieces, when its persecutor feasts on its carcass. The horses of Norway are diminutive, but strong, sure-

deer.Beasts of
prey.Feathered
game.

NOR-
WAY.

footed, and lasting. Their use is restricted to the Southern part, and in the North they are regarded rather as objects of curiosity than as useful stock. Horned cattle are a main object of the care of the Norwegian husbandman even so far as the 70th degree. In those high latitudes the defect of vegetable fodder is supplied by fish, which is devoured with avidity by cows, and does not impart a disagreeable flavour either to their milk or flesh.

Forests.

The pine forests, which supply the timber constituting the staple article of export, have greatly diminished in extent, in consequence of the vast quantities cut down every year. Birch trees spring up to replace the pines in consequence of a law of vegetation that the growth of any species is seldom renewed vigorously on the same soil but is replaced by some other. The ground in Summer is covered with numerous varieties of wild berries, which afford a salubrious and grateful article of food. The cloud-berry, *Rubus chamæmorus*, every where abounds, clothing the rocky surface to the very edge of the North Cape. It is used extensively as an article of diet when fresh, and is preserved in great quantities for Winter use.

Rural in-
dustry.

The Norwegian boor generally lives in much comfort on a farm of which he himself is usually the proprietor. His house is large, conveniently constructed of timber, and ornamented with grotesque carving and uncouth painting. The furniture is clumsy, yet not incommodious; the fare plain, but substantial and abundant, consisting of flesh, butter, milk, potatoes, and rye, barley, or oaten bread; beer and corn spirit constitute the principal beverages. In some places in years of dearth they are driven to the necessity of mingling with their meal a powder formed by grinding the inner part of the bark of the fir. The bread made of this wretched substitute has the shape of thin, circular cakes, and will keep unchanged for months or even years. In the Northern part, at the approach of Winter, milk is frozen, and in that state remains unchanged until the approach of Spring. When required for use it is exposed to the fire, and the melted surface taken off with a spoon until a sufficient quantity is obtained. Farms are often preferred in elevated situations, as they are placed above the general elevation of the clouds, and are exposed to the unobstructed rays of the sun. Fodder is in general scarce, and must be eked out with dried leaves and even with bark. At Drontheim and other sea-ports hay is imported from Britain and Ireland. This deficiency might be supplied by a judicious system of management. Horned cattle are the main object of the husbandman, who obtains from them abundance of cheese and butter. Sheep are kept for their wool, which is manufactured at home into clothing for the family.

Fisheries.

The fisheries constitute one of the most important departments of national industry. Their principal seat is at Vaage, one of the Loffoden Isles. Vast quantities of fish swarm every Spring in the channels and bays enclosed between those islands and the main land. 4000 boats and 20,000 men are employed on an average, and 15,000,000 fish are annually taken, of which a large portion is purchased by the Russians, who send annually between 300 and 400 vessels to this coast, and barter corn and naval stores for the produce of the fisheries. The remainder is cured for the most part without salt by exposure to the heat of the sun, and sent to Bergen. Cod-fish constitute by much the most important portion of the capture. They are principally taken by nets, into the wide meshes of which the fish thrust their heads and

being unable to withdraw them are hauled into the boats. Ling and halibut form a less important article. Salmon are caught in great abundance in the Arctic streams. Crabs and lobsters abound on the shore of the Skager Rack, and are conveyed alive to the London market in vessels constructed with wells containing salt water.

Iron-ore abounds in many parts of Norway, and 12,000 tons of that mineral are annually smelted. The annual average amount of copper is 500 tons, principally produced at Roraas, situated in the Dovrefield, at a height exceeding 2000 feet. The ore, a sulphuret combined with hornblende, is exceedingly rich, so that each of 172 shares, into which the property is divided, afford an annual income of 600 dollars. It lies on the left bank of the Glommen, near its source, and was discovered in 1644, soon after which time the population rose from 20 to 2000 persons. The silver mine of Kongsberg was in the early part of the last Century the richest in Europe. The silver was generally found in a metallic form in large masses, of which one, 6 feet 18 inches broad, and weighing 600 pounds, is preserved in the Museum of Copenhagen. Many other masses of various weights, from 200 to 400 pounds, have been obtained; but the occurrence of these is so rare, that the working of the mine has for many years been unprofitable, and is now attended with an average annual loss of 240,000 rix-dollars. The principal shaft is 200 fathoms deep and several hundred fathoms in circuit; the deepest shaft penetrates to the depth of 375 fathoms. The number of workmen employed exceeds 2000, and reluctance to deprive these of the means of subsistence is the only motive for the continuance of the works. The silver at present obtained suffices for an annual coinage of 130,000 dollars. The mine was discovered in 1623 by a young peasant, who stumbled over a thread of native silver. Kongsberg is situated on the river Louven, in latitude 59° 38' North, longitude 27° 11' East. Its population is 11,000. About 3000 hundred-weight of cobalt are produced at Skutterud and other mines. Gold was formerly obtained at Edsvold, but the works there have long been relinquished.

The manufactures, in a Country so thinly peopled, must necessarily be few and rude. Glass is made in considerable perfection at Garsjoe and other manufactories, established and supported by the Crown. Numerous distilleries produce the corn-spirit of which there is so vast a consumption. A few paper-mills and manufactories of woollen cloths occur in the large towns, but the *wadmal*, or coarse woollen used for the dress of the peasantry, is manufactured by their own families, and all finer wares are received from abroad in return for raw produce.

The long extent of coast, indented with numerous havens and inlets commodious for navigation, present such inducements as have, in all Ages, rendered the Norwegians a sea-faring people. Though they have in some degree relaxed from that activity which formerly dispersed their vessels from Greenland to the Straits of Gibraltar, they are still bold and active seamen, and export in their own shipping a large proportion of the bulky produce of their Country. The exports amount to the annual value of 6,000,000 of rix-dollars, of which 1,500,000 must be assigned to timber, principally fir and pine, 1,400,000 to fish; the other articles are iron, copper, potash, alum, leather, quills, feathers, and some others of inferior importance. The imports consist of corn, wines, salt, oil, colonial produce, and all articles of manufacture requisite for the consumption of a population of moderate

wealth and population. The shipping amounts to 1000 large vessels, navigated by 8000 seamen.

The principal marts are Christiania, Bergen, Drontheim, Christiansand, Frederickshall, and Drammen.

The population consists of 910,000 persons, or nearly 8 to each square British mile. Of this number, 420,000 persons are peasants, 90,300 sea-faring people of all denominations, and 6300 Ecclesiastics. There are three races: Norwegians, who inhabit the Southern part; Quäns, or Fins, who inhabit the Northern coast; and Laplanders, who are dispersed over the region to the North of the Arctic Circle. The Norwegian of Gothic descent is inferior in size to his Swedish neighbour, but possesses a frame suited for strength and activity. The hair, invariably light-coloured in youth, becomes dark in the later years of manhood, and the bright blue eye and florid tinge of the cheeks give the countenance an expression of health and cheerfulness. Women in easy circumstances, and exempt from fatiguing duties and exposure to the air, have generally great elegance of form, regularity of features, and delicacy of complexion. The Norwegian is considered by foreigners as more volatile and endowed with greater talents than the Danes or Swedes, but possessing less integrity and singleness of heart. He has a national dislike equally to Swedes and Danes, and the impartiality of his aversion has mitigated the disgust naturally resulting from the arbitrary arrangement by which foreign Potentates transferred his allegiance. The Language is a dialect of the Teutonic, and closely resembles those of Denmark and Sweden.

The Government of Norway is a limited monarchy, hereditary in the male line of the Royal family of Sweden. The King is irresponsible, and his person inviolate; he must conform to the Lutheran Religion, which is that established by Law. In the absence of the King, the Government is administered by a Viceroy, residing at Christiania. The executive power belongs exclusively to the King, the legislative is shared by the Storthing, or National assembly, which meets at Christiania in the beginning of the February of every third year. Its members are chosen by electors nominated by the burghers and landowners, and their number may not exceed 100, nor fall short of 75.

The annual revenue of the State amounts to £350,000, of which £14,600 are allocated to the Civil list, and £7200 to the payment of the interest of a very light National debt.

The military force consists, 1st, of troops of the line, amounting to 14,000 men, of whom 1300 are artillery and 1100 cavalry; 2dly, militia, into which all burghers between the ages of 27 and 35, and all countrymen between the ages of 27 and 30, must enrol themselves. All males dwelling on the coast, and of the age of 30 years, are required to enrol themselves into a force destined for defence against invasion. The numerous strong fortresses dispersed over the Kingdom have been levelled by the jealous precaution of the Storthing. The insignificant naval force consists of 6 brigs, 8 schooners, and 46 gun-boats.

Norway is divided into the following Provinces:

	Extent. Square miles.	Population.	Chief Towns.
Aggerhuus	31,500	395,000	Christiania.
Christiansand . .	13,860	133,711	Christiansand.
Bergen	14,100	130,000	Bergen.
Drontheim	63,000	339,712	Drontheim.

1. Aggerhuus is bounded on the North by the Province of Drontheim, East by Sweden, South by the Skager Rack, West by the Provinces of Christiansand and Bergen. It is a rough but very romantic region, containing many mountains, lakes, and rivers, and having its coast fringed with numerous rocky islets of singular forms. Gulbrandsdale, on the South of the Dovrefield, is remarkable for its fertility and picturesque beauty. At Kringelen, a pass on its Southern extremity, 1200 Scots, under the command of Colonel Sinclair, in 1612, were cut off by 500 peasants, who rolled stones on them from the overhanging cliffs. According to Von Buch, 60 of them were admitted to quarter, but afterwards massacred in cold blood, to save the expense of their maintenance. Sinclair had landed on the Western coast, and was attempting to reach Sweden when thus cut off. From the paucity of military events in Norwegian History, this exploit is the never-ending theme of the ballads and stories of the Norwegian peasants.

Christiania, the Capital of this Province and of the Kingdom, is beautifully situated at the head of Christiania Fiord. It is a handsome, thriving town, with broad and well-built streets, intersecting each other at right angles. The principal timber mart in the Kingdom is situated in the suburbs, and the vast piles of timber at some distance have the appearance of a town of wooden houses. It is not easy to find the way through the numerous and intricate passages which intersect these heaps. So extensive is the commerce in this article, that a single merchant, Bernard Ancker, has exported to the amount of £180,000 in a year, and found his mercantile operations so lucrative, that although he lived in great magnificence, he left a property worth 1,500,000 dollars. The inhabitants in easy circumstances are remarkable for their hospitable and social disposition, and so fond of Dramatic exhibitions, that the town supports two Theatres. There are four Churches, a University, and six Hospitals. The population is 12,000. Latitude 59° 55' North, longitude 10° 4' East.

2. Christiansand is bounded on the North and North-East by the Province of Aggerhuus, on the South-East, South, and West by the German Ocean, and on the North-West by the Province of Bergen. It is very mountainous, but contains many valleys, in which the soil consists of fertile loam. As in all other parts of Norway, the corn crop is insufficient for the support of the inhabitants; but this deficiency is now less felt in consequence of the increased culture of potatoes. Its Capital is Christiansand, situated on an extensive inlet capable of sheltering the largest navies, and as it lies conveniently for affording refuge to navigators embarrassed with the currents of the Skager Rack, its port is much frequented. From this circumstance the inhabitants derive their means of support, as all are engaged in the business of ship chandlery, or in similar employments. It has a cheerful, lively aspect, and is adorned with a Cathedral. Population 5000. Latitude 58° 8' North, longitude 7° 42' East.

3. Bergen is bounded on the North-East by the Province of Drontheim, East by that of Aggerhuus, South-East by that of Christiansand, South-West and North-West by the German Ocean. Its surface is very mountainous and its coast deeply indented with fiords and fringed with innumerable small islands, or *skiars* as they are called in the vernacular language. The climate is moist, and the Summers are sometimes very hot. It is one of the least wooded parts of Norway, as

the timber cut down for exportation has not been renewed by a fresh growth. It is very beautifully situated on the shore of the inlet called the Vaag, and surrounded by mountains of the height of 2000 feet. Its trade principally consists in the export of fish, caught among the islands of Loffoden. This extensive traffic employs 120 ships belonging to the town, and between 700 and 800 arrive annually from abroad. It has seven Churches and six Hospitals. The population of this flourishing town amounts to 20,000. Latitude $60^{\circ} 23' N.$, longitude $7^{\circ} 14' E.$

Drontheim.

4. *Drontheim*, or as it is generally called by the natives Tronyem, is bounded on the North by the Arctic Ocean, North-East by Russia, East by Sweden, South by the Province of Aggerhuus. As it extends through nearly 10 degrees of latitude, it possesses great diversity of climate. The temperature, however, is nowhere so severe as might be expected in so high a latitude. At Kiølvig, on the Island of Mageroe, close to the North Cape, and in latitude 71° , a stream of water continues flowing from the snow through the whole Winter. That spot, which contains a few houses permanently occupied, is regarded as the most Northern inhabited place on the Globe. At Alten, a degree further to the South, corn is successfully cultivated, and pines and birch attain the size of large timber. The North Cape, in latitude $71^{\circ} 10'$, is the most Northern part of Europe, and a frequent object of pilgrimage to enthusiastic votaries of Nature. It is described by Acerbi, (vol. ii. p. 110.) as "an enormous rock, which, projecting far into the Ocean, and being exposed to all the fury of the waves and outrage of the tempests, crumbles every year more and more. Every thing is solitary, every thing is sterile, every thing sad and despondent." Its height, 3200 feet, does not attain the limit of perpetual snow, nor exclude all vegetation, as it is covered in many parts by the cloud-berry shrub.

Town of
Drontheim.

Drontheim is the Capital of this vast Province. All travellers speak with enthusiasm of the picturesque beauty of its situation. Dr. Clarke describes it as situated on a bay, the most glorious that the eye has ever beheld. "The rising spires and white glittering edifices," he observes,

Strange images of death.

Shakspeare. *Macbeth*, fol. 132.

NORWICH, the Capital of the County of Norfolk, and the largest City in the Eastern district of England, is a place of great antiquity. It is mentioned in the *Saxon Chronicle* as having been destroyed by the Danes in the year 1004, and in the reign of Edward the Confessor it had no less than 22 Churches. It stands on the slope and summit of a gentle hill, running parallel to the Western bank of the navigable river Wensom, which is crossed by six bridges, and it terminates at an abrupt bend of that stream. The town was formerly defended on the land side by a wall, flanked with 40 towers, and entered by 12 gates, few traces of either of which now

VOL. XXV.

"reminded him of Naples, which it resembles. In picturesque beauty it does not yield to the Bay of Naples. The town is of very considerable size. Its streets are wide, well-paved, and filled with regular and well-built houses, generally plastered and white-washed." Four principal streets meet in the principal Square, in the centre of which is a conduit abundantly supplying the inhabitants with water. The inhabitants are remarkable for their hospitable and social disposition, and for the refinement of their manners. The Cathedral was built in the XIth Century, and until ruined by fire was one of the most magnificent in Europe. The style of architecture, containing a mixture of Gothic and Saxon, is light and highly finished, and some of the statues, according to Dr. Clarke, would not disgrace Grecian sculpture. It is a place of great commerce, principally in timber exported to Ireland. Population 10,000. Latitude $63^{\circ} 25' N.$, longitude $10^{\circ} 23' E.$

Norway, inhabited from the most remote antiquity by various Tribes of Gothic descent, was first united into one State by Harold Harfager, A. D. 875. This Monarchy was afterwards severed into many petty States by the various claims and dissensions of his descendants; but in 1028 was consolidated anew, and united to Denmark by Canute the Great. The sovereignty of the Danish Princes was however precarious, until, in 1397, the Royal dignity of both Countries became united with that of Sweden in the person of Margaret, the celebrated Semiramis of the North. Norway became completely incorporated with Denmark in 1537, and continued merely a Province of that Realm until 1814, when, in consequence of an arrangement, sanctioned by the General Congress of European Powers, it was attached by a federal union to Sweden.

Pontoppidan, (Bishop of Bergen in Norway,) *Natural History of Norway Translated*, London, 1755, 2 vols. folio; Swinton, *Travels in Norway in 1788, 1789, 1790, 1791*; Von Buch, *Travels through Norway, illustrated with Maps and Physical Sections, translated by John Black, with Notes by Professor Jamieson*, 4to. London, 1813; Kuttner, *Riese durch Norwegen*, Leipsic, 1802, 4 vols. 8vo.

remain. Although the streets for the most part are narrow and ill built, the city covers a large space of ground on account of the numerous gardens and orchards which are scattered in its various parts. The Castle, which stands nearly in the centre of the town, has afforded much food for antiquarian controversy, and opposite opinions have been stoutly maintained as to its Danish, Saxon, or Norman origin. Some parts, especially the large semicircular arch 40 feet in diameter, by which the one of its former three moats now remaining is crossed, can scarcely be refused to the architecture of the second named people; the Keep, the most striking portion of the existing structure, was probably built or repaired by Roger Bigod, a retainer of the Conqueror. It is a massive, quadrangular tower, 110 feet by 92 in its fronts, and 70 feet in the height of its three stories. The walls are covered with small semicircular arches, supported by three-quarter columns; the roof has fallen in. Attached to its Eastern side is an incongruous modern gaol, unhappily erected in 1793 from a fanciful design. The Cathedral was founded in the year 1096, and materially enlarged from time

History.

NOR- to time during the following Centuries. The Cloisters, which are among the most beautiful in England, were not completed till 1430. The style of the Cathedral is chiefly Norman, and its dimensions are, extreme length from East to West 411 feet; the nave from the Western door to the transept 140 feet; width with the aisles 72 feet; length of transept 191 feet; height of the central tower and spire 315 feet. The interior is grave and solemn, although lamentably disfigured by the evil taste of a modern Choir and Pews. The Bishop's Palace and the Deanery adjoin on the North and South. An Episcopal Chapel was built in 1662, near the site of one much older hard by the Palace. Some remains of a Priory may be traced on the South side of the Cathedral. The Chancel House, with a Chantry over it, erected in 1316, has been converted into a Free School; and on the site of that which once was St. Ethelbert's Parochial Church, stands a Gate, with a Chapel above it, dedicated to the same Saint. Another very beautiful Gate, called after its founder Sir Thomas Erpingham, who was sentenced to build it as a penance for Lollardism, opens to the Cathedral precincts on the West.

Of the 32 Parochial Churches which Norwich contains, St. Julian's perhaps exhibits some specimens of Saxon Architecture. St. Peter Mancroft is a large and handsome pointed building, on an elevated spot in an angle of the Market Place; the others possess few claims upon notice. St. Andrew's Hall, now used as a Corn Exchange, but before the additions to the present Guildhall in the Market Place employed for Civic and County business, is the ancient Church of a Monastery of Black Friars, the nave and two aisles being nearly perfect, and measures in length 120 feet, in width 72. An Assembly Room, a Theatre, a Bridewell, a joint County and City Hospital, and a Lunatic Hospital, are the other chief public buildings.

Norwich has long been the centre of peculiar woollen manufactures introduced by a Colony of Flemings, who settled in the neighbouring town of *Worsted* (a name familiar from the useful article first produced in it) in the reign of Henry I. Other settlers from the same Country joined their brethren in the reigns of Henry VI. and of Elizabeth; and numerous articles framed from mixed silk and woollen became marketable from Norwich throughout Europe. The earliest fabrication of bombasines is attributed to the year 1575. Two Churches were set apart for the use of the Flemings and their descendants, who are numerous, and enjoy many local privileges. To the silk and woollen manufactures have been added in later years those of cotton, lace, and linen. The commerce of the City is chiefly transacted at the port of Yarmouth, 32 miles distant. Two Members have been returned to Parliament since 25 Edward I. The population has increased largely in the last twenty years, notwithstanding an alleged decrease of trade. In 1786 it was 40,051; in 1811 it had fallen to 37,256; in 1821 it had reached 50,288; and in 1831 it was 61,110. Distant 29 miles N. E. from Thetford, 108 from London.

NOTA-
PHUS.

The all-wise Creator hath made sufficient provision for the reception of smells, by the apertures of the *nostrils*; made not of flesh or bone, but cartilaginous, the better to keep open, and withall to be dilated or contracted, as there is occasion. For which service it hath several proper and curious muscles.

Derham. Physico-Theology, book iv. ch. iv. p. 138.

Strew the deck
With lavender, and sprinkle liquid sweets,
That no rude savour maritime invade
The nose of nice nobility!

Cowper. The Task, book ii.

NOSODENDRON, in *Zoology*, a genus of *Coleopterous* insects.

Generic character. *Antennæ* longer than the *thorax*, concealed beneath its sides; the two basal joints robust, subovate; the third much elongate, subclavate, the four following very short, submoniliform, eighth broader, cup-shaped, the three following much incrassated, and forming an abrupt, subovate, compressed, perfoliate club, the apical joint of which is trigonate; *palpi* very short, the terminal joint longest, cylindric, obtuse; head trigonate; eyes small; *thorax* scarcely margined, transverse, rounded at the base; *scutellum* triangular, elongate; *elytra* convex, suborbicular, scarcely margined; body subhemispheric-ovate; breast broad; legs short, compressed, semicontractile; *tibiæ* broad, serrated a little exteriorly; *tarsi* short.

Type of the genus, *Sphæridium fasciculare*, Fabricius; Panzer, *Faun. Ins. Germ.* pl. xxiv. fig. 2. One species only, found under the bark of trees in sandy maritime situations, in England and other parts of Europe, but rare.

NOSTRIL. See **NOSE**.

NOT. See **No**.

NOT, *i. e.* ne woot, wit or know not.

And I woot such a man whethir in bodi or out of bodi I noot,
God woot. *Wiclif. 2 Corinthians, ch. xi.*

Forsoothe he was a worthy man withalle
But soth to sayn, I n'ot how men him calle.

Chaucer. Prologue to the Canterbury Tales, v. 286.

What shall I thinken in this cas
Of that I here nowe a daie
I not.

Gower. Conf. Am. book ii. p. 68.

NOTAMIA, in *Zoology*, a genus of *Zoophytes*.

Generic character. Polypiferous mass, with a slightly calcareous sheath; cells in pairs, united by the back, a joint above and below.

Type of the genus, *Sertularia corallina*, Linnæus, pl. ii. fig. 314. Ellis, *Corr.* vol. xl. pl. xxi. Two species, indigenous to the British seas, a little beyond low-water mark.

NOTAPHUS, in *Zoology*, a genus of *Coleopterous* insects.

Generic character. *Palpi* six; the external maxillary with the terminal joint very minute nearly truncate, the third very pilose, longer than the second; labial with the terminal joint rather stout; *labrum* quadrate, entire; mandibles rather stout, somewhat acute; *mentum* emarginate anteriorly, the emargination with an acute central lobe; *antennæ* with the two basal joints naked, the rest pubescent, the third and fourth shorter than the fifth; head ovate, with two frontal sulci and a deep fold on each side adjoining the eyes; *thorax* cordate-truncate, attenuated behind; body slightly depressed; *elytra* oblong-ovate, the sutural stria rather elongated; anterior *tarsi* of the males with the basal joint dilated.

Type of the genus, *Bembidium undulatum*, Sturm.; *Not. undulatus*, Stephens, *Illust. of Brit. Entomology*, vol. ii. pl. x. fig. 4. Ten species, usually frequent damp, sandy, or gravelly situations; nine are indigenous.

NOTARIS, in *Zoology*, a genus of *Coleopterous* insects.

Generic character. *Antennæ* geniculated, twelve-jointed, inserted towards the apex of the rostrum, rather stout; funiculus seven-jointed, its two basal joints slightly elongate, obconic; the remainder short, nodose, subequal; club oblong-ovate, acuminate at the apex; head small, produced anteriorly into a very long, bent, cylindric rostrum; eyes depressed; *thorax* somewhat globose, slightly truncate anteriorly and posteriorly, lobate behind the eyes; *scutellum* small, triangular; *elytra* oblong, rather convex, the apex simple; legs moderate, stout, anterior approximating; *femora* simple; *tibiæ* straight, anterior a little bent at the apex, and armed within with a minute hook.

Type of the genus, *Curculio acridulus*, Linnæus. Two species, found in damp and marshy situations in Britain and on the Continent of Europe.

NOTCH, *v.* } A notch,nock, or nick, incisura,
NOTCH, *n.* } from the verb to nick, incidere, to cut into.

An incision; a cut into, a hollow cut into any thing.

i. He was too hard for him directly to say the troth out before Corioles, he scocht him and *notcht* him like a carbinado.

Shakspeare. Coriolanus, fol. 23.

Which being drawn vp to the top of the frame is there fastned by a wooden pin (with a notch made into the same after the manner of a Samson's post.)

Holinshead. The Description of England, vol. i. ch. xi. p. 312.

He was sitting upon the ground upon a little straw, in the furthest corner of his dungeon, which was alternately his chair and bed: a little calendar of small sticks were laid at the head, *notched* all over with the dismal days and nights he had passed there.

Sterne. Works, vol. ii. p. 349. A Sentimental Journey through France and Italy.

This, this the saving doctrine preach'd to all,
From low St. James's up to high St. Paul,
From him whose quills stand quiver'd at his ear,
To him who *notches* sticks at Westminster.

Pope. Horace. Epistle l. book i.

The middle claw of the heron and cormorant is toothed and *notched* like a saw. These birds are great fishers, and these *notches* assist them in holding their slippery prey.

Paley. Natural Theology, ch. xiii. p. 267.

Fr. *noter*, *notifier*; It. *notare*, *notificare*; Sp. *notar*, *notificar*; Lat. *notare*, *notificare*, *notum facere*; to make known. *Notare*, from *notum*: *nam eo rem notamus ut e nota sua cognoscamus*. Vossius. We mark or *note* a thing, that we may know or distinguish it by its mark.

To mark, sign, or designate; to distinguish, to remark, to observe; to look at or regard as remarkable; to attend to.

Notable, or remarkable; now applied to persons, is used as equivalent to observant, attentive, *sc.* to matters of housewifery or domestic economy.

A *note*, a mark or remark; that which we mark or remark, observe, or take account of; observation,

NOTA-
PHUS.
NOTE.

NOTE. account, estimation, reputation; also applied (though not now so restricted) to an epistle conveying a note or remark; also to a memorandum in writing specifying a promise to pay a debt. See the Quotation from Blackstone.

And under lȳnde in a launde. lenede ich a stounde
To lithen here laies, and here loveliche notes.
Piers Plouhman. Vision, p. 169.

And bad Gyle go gyve. gold aboute
Nameliche to notaries. *Id. Ib. p. 32.*

For there was none of hem that fained
To sing, for ech of hem him pained
To find out many crafty notes,
They ne spared nat hir throtes.
Chaucer. The Dream, p. 322.

And eke they had a thing notable,
Unto their death, ay durable,
And was, that their beauty should dure.
Id. Ib. p. 379.

And if a rethor coude faire endite,
He in a chronicle might it sauffy write,
As for a soveraine notabilitee.
Id. The Nonnes Preestes Tale, v. 15215.

But goeth now rather awaie ye mermaidens whiche that ben
swete, till it be at the last, and suffereth this man to be cured and
healed by my muses, that is to say, by my notefull sciences.
Id. Boecius, book i. p. 408.

Now as to the outrageous array of women, God wote, that
though the visages of som of hem semen full chaste and debonaier,
yet notifen they, in hir array of attire, licourousness and pride.
Id. The Persones Tale, p. 154.

But wherefore eschaufeth it with so great loue (*sed cur tanto
flagrat amore*), to finden thilke notes of sothe icouered, that is to
saine, wherefore eschaufeth the thought of man, by so greute desire,
to knowe thilke notificacions that been ihid vnder the couertures of
sothe? *veri tectas reperire notas.*
Id. Boecius, book v. met. 3.

I wil be bold by hys licence to note in them [these wordes] a
little lacke of wyt, and some good store of folly.
*Sir Thomas More. Workes, fol. 1077. Aunsweere to the Poysoned
Boke, &c.*

For suche of my seruantes as I haue promoted
One faute or other in them shalbe noted.
Skelton. The Crowne of Laurell.

Slouthe is a sinne so comō, and no notable act therin, that is
accounted for heynous and abhomynable in thestimation of the
worlde as is in theft, &c.
*Sir Thomas More. Workes, fol. 102. A Treatise vpon Wordes of
Scripture.*

And slewe and bete downe a great nombre of the moost notablest
of the cyte.
Lord Berners. Froissart. Cronycle, vol. i. c. 346. p. 549.

All this notwithstanding neither could the notableness of the
place, being the very loving Lord's law, make us to marke it.
Homilies, part ii. p. 16. Sermon against Perill of Idolatry, part i.

In the thirde and fourth he sheweth before, and that notablye, of
the ioepardous times towarde the end of the worlde.
Bible, Anno 1551. Prologe vpon the Second Epistle of Timothy.

Wherefore they sayd, they wold send and defye the Frēche kyng
notably: and so they did.
Lord Berners. Froissart. Cronycle, vol. i. ch. 252. p. 375.

Now had they there standing vnknewen vnto mee, a notary, which
did make an instrument of all my agreeementes.
Barnes. Workes, fol. 220. Disputation between the Bishops and him.

To make an end, I pray you take paines, it is a day note-worthy
(as we used to say) give mee leave to make you weary this day.
Latimer. Sermons, p. 85.

Or to the groves where birds from heat or weather
Sit sweetly tuning of their noates together.
Browne. Britannia's Pastorals, book i. song 4.

But never let th' ensample of the bad
Offend the good: for good, by paragone
Of evill, may more notably be rad.
Spenser. Faerie Qucene, book iii. can. 9.

The notation of a word is, when the originall thereof is sought
out; and consisteth in two things; the kind and the figure.

Ben Jonson. The English Grammar, ch. viii. fol. 55.

Luc. Oh, did you so? and do you remember what you said of
the duke?

Duk. Most notably sir.

Shakspeare. Measure for Measure, fol. 82.

Honor got out of flint, and on their heads
Whose virtues, like the sun, exhal'd all valours,
Must not be lost in mists and fogs of people,
Noteless, and out of name, but rude and naked.

Beaumont and Fletcher. Bonduca, act ii. sc. 1.

Postellus, and the noter upon him, Severtius, have much admired
this manner of section.

Gregory. Posthum. (1650,) p. 308.

But they persisted deaf and would not seem
To count them things worth notice.

Milton. Samson Agonistes, l. 250.

His [Duke Robert] worthie acts valientlie and fortunately
atchiued against the infidels, are notified to the world by many and
sundrie writers.

Holinshed. Henry I. Anno 1107, vol. ii. p. 56.

And if the death of God's saints be as it is precious in his sight,
there is great reason it should be so in ours; and therefore well
worthy of a publick notification.

Hall. Sermon 42. Life a Sojourning.

Onely this by way is notewoorthie, that the Danes had an vnperfect
or rather a lame and limping rule in this land, so as the gouernours
were watchfull, diligent, politique at home and warlike abroad.
Holinshed. The History of England, vol. i. book vii. ch. i. p. 702.

And now, in the last place, to mention one sinner more, and him
a notable leading sinner indeed, to wit, the rebel.

South. Sermons, vol. ii. p. 29.

There being scarce any man, who arrives to any sound under-
standing of himself, or his own interest, till he comes to be once or
twice notably deceived by such an one, of whom he was apt to say
and think, according to the common phrase, I would trust my life
with him.
Id. Ib. vol. vi. p. 368.

Scribe was a name, which amongst the Jews was applied to two
sorts of officers. i. To a civil; and so it signifies a notary, or in a
large sense any one employed to draw up deeds or writings.

Id. Ib. vol. iv. p. 6.

The notator Dr. Potter in his epistle before it to the reader saith
thus, *Totum opus, &c.*

Wood. Athenæ Oxonienses, fol. 941.

But suppose at length, that the profane aspirer should be so
lucky, or so successful, (for happy I cannot think it) as to attain
the so criminally courted notedness.

Boyle. Works, vol. ii. p. 306. On the Style of the Holy Scriptures.

For, as no law can bind, 'till it be notified or promulged; so neither
can this faculty of the soul oblige a man, 'till it has first informed
him.

South. Sermons, vol. iii. p. 47.

Promissory notes, or notes of hand, are a plain and direct en-
gagement in writing, to pay a sum specified at the time therein
limited to a person therein named, or sometimes to his order, or often
to the bearer at large.

Blackstone. Commentaries, book ii. ch. xxx. p. 467.

Notation is the setting down in figures any number proposed in
words.

Hutton. Course of Mathematics, vol. i. p. 6.

And not to draw out philosophy from too profound a source, we
shall have recourse to a noted story in *Don Quixote*.

Hume. Essay 23. vol. i. p. 230.

Such protest must also be notified, within fourteen days after, to
the drawer.

Blackstone. Commentaries, book ii. ch. xxx. p. 469.

NOTERUS, in Zoology, a genus of Coleopterous
insects.

Generic character. Palpi six, external maxillary with
the terminal joint elongate-ovate, the preceding and
basal one shortest; labial with the basal joints short,
the last very large, broad, and emarginate at the apex;
labrum small, rounded; mandibles deeply emarginate
at the tip, with a small tooth towards the base; mentum

NOTE.
—
NO-
TERUS.

NO-TERUS. emarginate anteriorly, with an obsolete lobe in the centre; *antennæ* with the fifth or seventh joint dilated, the rest simple, gradually diminishing to the last, which is acute; head rounded, convex; *thorax* with a triangular projection in the place of the *scutellum*, which is wanting; body very convex, attenuated posteriorly; posterior legs subnatorial; posterior *tibiæ* short; all the *tarsi* with five joints; males with the anterior *tibiæ* very short, dentate internally.

Type of the genus, *Dytiscus crassicornis*, Fabricius. See Stephens, *Illust. of British Entomology*, vol. ii. pl. xi. fig. 6. Two indigenous species, frequenting clear waters.

NOTHING, } *i. e.* no thing, or not any thing;
NOTHINGNESS. } equivalent to the Lat. *nihility*, non-
entity, or nonexistence; also applied to any thing very small or minute, of no worth or value; worthless, trifling.

For þing þat woneþ, & noþing wexeþ, sone it ys ydo.
R. Gloucester, p. 42.

————— Noþyng hym ne ssolde at stonde.
Id. p. 303.

Therefore drede ye not hem, for *nothing* is hid that schal not be thewid and *nothing* is privy that schal not be wist.

Wiclif. Matthew, ch. x.

Feare them not therefore, there is *noþyng* so close, that shall not be opened, and *noþyng* so hyd, that shall not be known.

Bible, Anno 1551.

For gentil men they wer of gret estat,
And *nothing* but for love was this debat.
Chaucer. The Knightes Tale, v. 1756.

I had rather from an enemy, my brother,
Learn worthy distances and modest difference,
Than from a race of empty friends, loud *nothings*.
Beaumont and Fletcher. The Maid of the Mill, act i. sc. 1.

Other stars may have their severall vertues and effects, but their marvailous remoteness, and my undecernable *nothingness*, may seem to forbid any certain intelligence of their distinct workings upon me.

Hall. Works, vol. iii. fol. 709. *Select Thoughts*, xxii.

————— I that am
A *nothingness* in deed and name
Did scorn to hurt his forfeit carcass
Or ill entreat his fiddle or case.

Butler. Hudibras, part i. can. 2.

In examining this performance, *nothing* must be considered as having not only a negative but a kind of positive signification; as I need not fear thieves, I have *nothing*, and *nothing* is a very powerful protector. In the first part of the sentence it is taken negatively; in the second it is taken positively, as an agent.

Johnson. Life of Rochester.

NOTHUS, in Zoology, a genus of *Coleopterous* insects.

Generic character. *Antennæ* eleven-jointed, simple, filiform, the basal joint robust, second very short, remainder of nearly equal length, the terminal one shortest, elongate-acuminate, and the basal ones rather longer than the others; *palpi* unequal; maxillary with the terminal joint elongate, securiform; labial with the same joint transversely-securiform; mandibles entire at the apex; *labium* deeply notched; head nutant, with a rather broad base; eyes emarginate; *thorax* transverse-orbiculate, with the sides margined; body elongate, of soft texture, nearly cylindric, narrow; *coleoptra* not broader than the *thorax*; legs moderate; *femora* slightly thickened; *tibiæ* simple, with extremely short spurs at the apex; *tarsi* with the penultimate joint bilobed; male with the posterior *femora* considerably incrassated, concave within, with an obscure tooth towards the apex, and the *tibiæ* of the same; legs stout, curved, angulated at the base, and terminating at the apex within in an acute spine, the apex itself with two short spurs.

Type of the genus, *N. bimaculatus*, Olivier; Stephens, *Illust. Brit. Entomology*, (Mand.) vol. v. p. 59. pl. xxv. fig. 3. ♂. fig. 2. ♀. Two species, found in flowers, one of them in Britain, but very rare.

NOTION, } Fr. *notion*; It. *notione*; Lat.
NOTIONAL, } *notio*, from *notum*, past participle of
NOTIONALITY, } *noscere*, to know. It would be of
NOTIONALLY, } service to establish a distinction in
NOTIONIST. } the usage of *idea* and *notion*.
Locke and Bolingbroke both attempt it, but with no effect. *Idea* might be used as a simple and specific term to express our sensations numerically separate; *notion* as a general and complex term for a collection of *ideas*: and thus we could not (and now should not) say, "I have an *idea* of a man, or of an animal; but we might say with propriety, I have a *notion* of a man, or of an animal." *Notion* is now used indiscriminately as equivalent to

Idea, perception, conception, opinion, thought; and was used (as in the Quotation from Shakspeare and Milton) for knowledge, power of knowing or understanding.

The stoicks are of opinion and say, that when a man is engendered he hath the principal part of his soule which is the understanding, like for all the world unto a parchment or paper ready to be written in; and therein he doth register and record every several *notion* and cogitation of his.

Holland. Plutarch, book iv. ch. xi. fol. 684.

Do's Lear walke thus? speake thus? Where are his eies?
Either his *notion* weakens, (or) his discernings
Are lethargied.

Shakspeare. Lear, fol. 289.

Immediate are the acts of God, more swift
Then time or motion, but to human ears
Cannot without process of speech be told,
So told as earthly *notion* can receive.

Milton. Paradise Lost, book vii. l. 179.

Thou hast not ear, nor soul to apprehend
The sublime *notion*, and high mystery,
That must be utter'd to unfold the sage
And serious doctrine of virginity.

Id. Comus, l. 785.

This hath muddled the fountain certainly with *notional* and ethnick admixtions; and platted the head of evangelical truth, as the Jews did its author's, with a crown of thornes.

Glanvil. The Vanity of Dogmatizing, ch. xvii. p. 166.

I aimed at the advance of science by discrediting empty and talkative *notionality*.

Id. Ib.

For it [the mind] being once furnished with simple ideas, it can put them together in several compositions, and so make variety of complex ideas, without examining whether they exist so together in nature, and hence I think it is that these ideas are called *notions*, as they had their original and constant existence more in the thoughts of men than in the reality of things.

Locke. Works, vol. i. fol. 122. *Of Human Understanding*, book ii. ch. xxii.

Content not yourselves with some part of it, that you read the gospel, or new Testament, but neglect the old as is the practice of some flush *notionist*.

Bishop Hopkins. Exposition of the Lord's Prayer, p. 297.

The whole rational nature of man consists of two faculties, understanding and will, whether really or *notionally* distinct, I shall not dispute.

Norris. Miscellaneous.

I distinguish here, between ideas and *notions*: for it seems, to me, that as we compound simple into complex ideas, so the compositions we make of simple and complex ideas may be called, more properly, and with less confusion and ambiguity, *notions*.

Bolingbroke. Works, vol. v. p. 149. *Essay 1. Of Human Knowledge*, sec. 2.

NOTIOPHILUS, in Zoology, a genus of *Coleopterous* insects.

Generic character. *Palpi* six, external maxillary

NOTHUS.
—
NOTIOPHILUS.

PHILUS.NOTO-
NECTA.

and labial with the last joint short, slightly tumid, subovate, truncate; *labrum* entire, rounded, nearly covering the mandibles, which are slightly dentate internally; *mentum* emarginate anteriorly, with a bifid central lobe; *antennæ* slender, slightly thickened towards the extremity; head broad, deeply sulcated between the eyes, the latter large and prominent; *thorax* quadrate, flat, as broad as the head; *elytra* depressed, elongate, and nearly parallel; legs rather slender; anterior *tibiæ* emarginate at the extreme tip; anterior *tarsi* of the males not dilated.

Type of the genus, *Cicindela aquatica*, Linnæus; Donovan, *Britt. Ins.* vol. viii. pl. 351. fig. 2. About eight species natives of Europe, frequenting damp or gravelly and sandy situations; they are very lively, active, and voracious: seven species have at present been discovered in Britain.

NOTOCERAS, in *Botany*, a genus of the class *Tetradynamia*, order *Siliquosa*, natural order *Cruciferae*. Generic character: pod four-angled, angles sharp edged, apex of the valve a horn-shaped spine; seeds oval, compressed.

Four species, natives of the Northern hemisphere.

NOTODONTA, in *Zoology*, a genus of *Lepidopterous* insects.

Generic character. *Palpi* two, short, very hairy, biarticulate; basal joint minute, terminal compressed, truncate; *maxillæ* short; *antennæ* filiform, bipectinated in the males, the pectinations short, and nearly vanishing at the apex; in the females slightly denticulated within, and ciliated; head and eyes small; *thorax* not crested; *abdomen* somewhat elongated, robust, subcylindric; the apex downy; wings anterior, obtuse at the apex, with the hinder margin rounded and denticulated; the interior or dorsal edge with a projecting tuft of scales in the centre; legs short, robust, densely clothed with scales and hair; the anterior *tibiæ* with an elongate lobate appendage on the inner edge; anterior *tarsi* short, stout, clothed with elongate, scale-like hair. Larva naked, with two or more conical protuberances on the back, the anal segment reflected, and bearing two imperfect prolegs; pupa subterranean, folliculated.

Type of the genus, *Phalæna bombyx dromedarius*, Linnæus; Donovan, *Britt. Ins.* vol. x. pl. 350. fig. 1. About six species, natives of the temperate and warmer regions of Europe; three of them indigenous to Britain.

NOTONECTA, in *Zoology*, a genus of *Hemipterous* insects.

Generic character. *Antennæ* very short, concealed beneath the eyes, attenuated towards the extremity, four-articulate, the basal joint very minute, round, large, cylindric, third more slender, subcylindric, a little attenuated at the base, fourth half as long, more slender, conic-cylindric; *rostrum* as long as the head, conical, depressed, triarticulate; body cylindric-ovoid; head vertical; eyes large, ovate; *thorax* transverse, a little narrowed in front; *scutellum* distinct, trigonal; *elytra* inclined; four anterior legs with two strong claws at the apex; posterior with small claws, formed for seizing; *tarsi* all four-jointed.

Type of the genus, *N. glauca*, Linnæus, Roësell, *Ins. Belust.* vol. iii. pl. xxvii. The insects of this genus live in the water both in their larva and perfect states; they swim well, and upon their backs, whence the name of the genus; several species have been discovered in Europe, and of these, three have been detected in Britain; they are carnivorous.

NOTOPTERUS, from the Greek *νότος*, a back, and *πτερόν*, a fin, Lacepede. In *Zoology*, a genus of animals belonging to the family *Clupeoides*, order *Mala-copterygii Abdominales*, class *Pisces*.

Generic character. Cheeks and gill-flaps scaly; maxillary and palatine teeth very delicate; lingual teeth strong and curved; body strongly compressed; ventral keel dentated; dorsal fin small and soft; ventral very small, closely followed by a long anal fin which joins the caudal.

The two species forming this genus were included among the *Gymnoti* by Pallas and Gmelin, but are distinguished by their small dorsal fin: they are

N. Kipirat, Lacep.; *Gymnotus Notopterus*, Lin. About eight inches long; the muzzle short and rounded; a small aperture above each eye, which are large; mouth and vent nearly approximated; tail very long; have a very brilliant appearance, their colour consisting of gold and silver. From the sea washing Amboyna.

N. Squamosus, Lacep.; *Gymnotus Asiaticus*, Gmel. Rather larger than the preceding; with a little beard in front of each nostril; colour dusky, marked with brown stripes. From the Asiatic Seas.

See Lacepede, *Histoire des Poissons*.

NOTO'RIOUS, } Lat. *notorius*; Fr. *notoire*; It. *notorio*; Sp. *notorios*; from *no-*
NOTO'RIOUSLY, } *tum*, past participle of *noscere*, to
NOTO'RIOUSNESS, } know.
NOTORI'ETY. }

Known, publicly or well-known; evident, manifest; famous or infamous.

If I were so desirous to haue my capacitie knowne I shoulde haue done much better to haue trauailed in some *notorious* peece of worke, which might generallie haue spred my commendation.

Gascoigne. To the Reverend Deuines.

Than it seemeth to be conuenient that the ordinary sende for hym, not as for a man yet *notoriously* knowe or detected for an heretike, but to know farther, whether it be true as the other hath reported or not.

Sir Thomas More. *Workes*, fol. 960. *The Debellacion of Salem and Byzance*.

As when we come to that time, by the grace of Christ, shall hereafter more ampli and *notoriously* appeare.

Fox. *Martyrs*, fol. 539. *The Defence of the Lord Cobham*.

Such men these had, to mischief wholly bent
In villainy *notorious* for their skill.

Drayton. *The Barons' Wars*, book v.

The armies, either hauing in horroure the warre, or loathing both princes, whose shames and dishonours were daily diuulged more *notoriously* abroad, consulted among themselues to surcease the contention.

Savile. *Tacitus*, book i. ch. i.

His actions are strong encounters and for their *notoriousness* always upon record.

Overbury. *Charact*.

A man may pass as surely to hell by a sin of less noise and infamy, as by one more flaming and *notorious*.

South. *Sermons*, vol. vi. p. 401.

He that pursues his vice *notoriously* has not so much religion as the fear of men would suggest to the discourses of an ordinary reason.

Id. *Ib.* vol. viii. p. 32.

We now see what a multitude of pagan testimonies may be produced for all those remarkable passages, which might have been expected from them: and indeed of several, that, I believe, do more than answer your expectation, as they were not subjects in their own nature so exposed to *notoriety*.

Addison. *Miscellaneous Works*, vol. iii. p. 287. *Of the Christian Religion*, sec. 2.

It is in the future confirmation or contradiction of the account; in its permanency, or its disappearance; its dying away into silence or its increasing in *notoriety*; its being followed up by subsequent

RIOUS.

NOTORIOUS. accounts, and being repeated in different and independent accounts, that solid truth is distinguished from fugitive lies.
Paley. *Evidences*, vol. i. p. 329. prop. ii. ch. i.

NOTTINGHAMSHIRE. NOTOXUS, in *Zoology*, a genus of *Coleopterous* insects.

Generic character. *Antennæ* subfiliform, inserted before the eyes, simple, eleven-jointed, the articulations a little obconic, the second smallest, the remainder somewhat equal, the last oval; mandibles slightly curved, acute, cleft at the apex; *palpi* with the terminal joint securiform; body oblong; head nutant, united by a slender neck to the *thorax*, the latter heart-shaped, narrowed and truncate posteriorly, with the anterior edge prolonged into a point in form of a horn projecting over the head; *scutellum* minute; legs rather long; *tibiæ* very short; *tarsi* heteromerous.

Type of the genus, *Meloe monocerus*, Linnaeus; *N. monocerus*, Panzer, *Faun. Ins. Germ.* pl. xxvi. fig. 8. About ten species, found in sandy situations, in hedges; two are indigenous.

NOTTED, } Junius says, "Nott the hair,
NOTT-HEAD, } *attondere comas.*" Ray, "To not,
NOTT-HEADED, } and notted, polled, shorn, Essex:
NOTT-PATED. } ab A. S. *hnót*, of the same signification." Tyrrwhitt, "A *not-hed*; a head like a *nut*; from the hair, probably, being cut short. It has since been called a *round-head*, for the same reason."

A *not-hed* hadde he, with a browne visage.

Chaucer. *Prologue to the Canterbury Tales*, v. 109.

He caused his own head to-bee polled, and from thenceforth his beard to-bee notted and no more shaven.

Stowe. *Annals*. 27th Henry VIII.

Your nott-headed country gentleman.

Chapman. *The Widow's Tears*.

PRIN. Wilt thou rob this leatherne-jerkin, christall-button, nopped, &c.
Shakespeare. *Henry IV. First Part*, fol. 56.

Situation,
extent, and
boundaries.

NOTTINGHAMSHIRE, a County of England, bound by Yorkshire on the North, Lincolnshire on the East, Leicestershire on the South, and Derbyshire on the West. It is 50 miles long, 25 broad, and contains 750 square British miles. The surface is varied, but not rendered irregular by any great eminence. The highest portion of the country consists of hilly ground lying to the North-East of the town of Nottingham, whence it extends to the border of Lincolnshire, and there terminates in an abrupt brow, which some Geologists conjecture formed the sea-coast before the German Ocean had retired to its present limits. The Wolds to the South of Nottingham are a chain of bleak hills, the greater part of which remain uncultivated, uncultivated, and devoid of wood. Adjacent to this tract the Vale of Belvoir extends, picturesque, fertile, and exhibiting a scene of luxuriant productiveness, and skilful cultivation, perhaps no where excelled. The great quantity of timber which adorns this County, the variety of its surface, and the high degree of improvement which it has received from art, render it one of the most beautiful and delightful parts of the Kingdom.

Soil.

The soil in the greater part of the County is sandy, of various degrees of fertility, from bleak and sterile hills, which support only a growth of scanty copsewood, and feed no stock larger than rabbits, to the productive country lying along the Trent, where a rich vegetable mould extends over a stratum of gravel. This sandy soil, which extends over about three-fifths of the County, is the most wooded, the Forest of Sherwood

stretching over it to the length of 25 miles, with an average breadth of 8. The clay tract extends along the Western bank of the Trent, having a length of about 25 miles, with an average breadth of 7. The Wealds, South-East of the Trent, are an isolated portion of this soil, and contain about 25 square miles. In the Northern and more extensive tract the clay is friable in consequence of containing a considerable proportion of sand, so that it is easily broken down by the plough, and of a high degree of fertility. The greater part of this soil is a red earth, the remainder dark coloured. The soil of the Wealds is a cold clay. A narrow tract of coal and limestone extends along the Western border of the County. The limestone in general lies near the surface, and supports a vegetable mould of no great strength or fertility. The area of the coal-tract probably does not exceed ten square miles. The uppermost stratum of coal is in general covered by a cold blue or yellow clay.

Sherwood Forest, occupying the Western part of the County, has an area of 103,000 square British miles. In it are comprehended several parks, taken in at different times, as Welbeck, Clumber, Thoresby, Berkwood, Newstead, Clipstone, and several villages and lands adjoining to them. The whole soil of the forest has been granted to different Lords of Manors, reserving to the Crown the rights of vert and venison or the property of trees and deer. In addition to the permanent inclosures the inhabitants of townships have a privilege, with the consent of the Lord of the Manor and two verdurers, to make temporary enclosures of woodland to the extent of from 40 to 250 acres, which may be retained in cultivation for five or six years. So much has the timber been destroyed in this celebrated forest as to justify the remark of a tourist, that Robin Hood could scarcely find shelter in it for a week. The only considerable remains of the ancient woodland are now to be found in the Hays of Birkland and Bilhagh, which form an open wood of large ancient oaks, free from underwood, but generally in a state of decay. The number of trees in this tract of about 1500 acres is about 10,000, valued at £17,000. Isolated trees of great size have been preserved in the parks severed from the Forest. Some oaks in Clumber Park are above 30 feet in circumference. An oak on the West side of Clipstone Park has received the name of the Parliament oak, from a tradition that at its foot a Parliament was held by Edward I.

Nottinghamshire, being situated between 52° 50' and 53° 34' of latitude, has later seasons than those of the more Southern Counties. Peculiarities of soil, however, modify the influence of the climate on the crops, so that oats and rye on the dry gravelly soils are as early as in most parts of England, being usually brought to market before the beginning of August. The harvest, however, is in general late, that of wheat being from the beginning of September to the middle of November. The climate is considered one of the driest in England, which probably results from the clouds driven Eastward from the Atlantic being intercepted by the hills of Derbyshire, on which they discharge the principal portion of rain. Hence it is that rains are more usually caused by Easterly winds than by any other.

The Trent, the principal river of this County, ranks as the fourth of English rivers, being exceeded by the Thames, Severn, and Humber in volume of water,

though not in length of course, in which respect it is considered superior to any of the three. It rises near Biddulph, in the moorlands of Staffordshire, and as it receives close to its source a number of rivulets it is soon increased into a considerable stream, and becomes navigable at Burton, in Derbyshire. It enters Nottinghamshire near Radcliffe on Soar, with a clear stream and bold and rapid current flows by Clifton and Nottingham, and adorns the beautiful scenery of Holme, Pierpoint, and Radcliffe. Near Newark it changes the direction of its course, previously North-Eastward, to one due North, in which it flows as far as Clifton upon Trent, where it becomes a boundary between Nottinghamshire and Lincolnshire, and passes Gainsborough, but does not leave the County until it reaches Heck Dyke, whence it proceeds, after a course of two hundred miles, to the Humber. Its principal tributaries within this County are, the Erwash, the Great, the Idle, and the Lene.

Canals.

Nottinghamshire has an extensive and well-distributed inland navigation by means of its canals. The Chesterfield Canal having commenced at the town of the same name enters this County near Shire Oaks, and passes by Worksop, through the Northern limits of Sherwood Forest to Retford, whence it proceeds to join the Trent at Stockwich, having at Drakelow passed under a tunnel 250 yards in length. Its fall from the summit level near Norwood to the Trent is 335 feet. The Nottingham Canal extends 15 miles through this County in a North-Western direction, and joins the Trent with the Cromford Canal with which it unites near Langley Bridge. The Idle River Canal is an artificial channel for the water of that river for ten miles before it falls into the Trent. It sometimes bears the name of the Bycar Dyke, and forms for a few miles the Northern boundary between this County and Lincolnshire.

Rural industry.

The farms, in general, are cultivated either by those who hold them in fee-simple, or by tenants who hold at will, and constitute by far the greatest portion of the landholders in this County. In this last case the outlay of fixed capital is made by the landlord, who charges the tenant a reasonable interest. In the sandy tract turnips are a most important crop, followed in the rotation of cultivation by barley, then clover, then wheat, after which the land is laid down for a few years in grass. Potatoes are cultivated to great extent, and weld, or dyer's-weed, the *Reseda luteola* of Linnæus, is an important crop, of which half a ton, worth on an average £10, is often produced on an acre. Licorice was formerly produced in this neighbourhood, but its cultivation has of late years been relinquished. Much of the clay tract is kept under grass, chiefly employed in feeding, and less extensively for the purposes of the dairy. On the Southern bank of the Trent are several large dairies having from twenty-five to forty milch cows, chiefly kept for the production of cheese. About 1400 acres are employed in the growth of hops, distinguished in commerce by the name of North-Clay-Hops, and much esteemed in consequence of their efficacy in imparting the peculiar flavour and pharmaceutical qualities of the herb, since a given quantity will go as far as twice the same weight of the Kentish sort. But nice judges discover a rank flavour in the hops of Nottinghamshire. Much expense has been incurred in improving the breed of sheep, insomuch that £400 have been paid for the use of a ram during one season. This sort of stock suffers greatly from the rot, supposed to be caused by a

flat worm, the *Fasciola hepatica* of the zoological systems, and popularly called a *fluke*, which is found in wet pastures adhering to the stones and plants, and likewise in the livers and biliary ducts of sheep infected with rot. Removal to a dry, limestone sheep-walk, or the administration of draughts formed of bitter herbs and salt, have generally, if adopted in time, produced a cure.

There is a great trade carried on in this County by water, by means of the Trent and of different canals. The exports, which pass either from or through the County, and form a very lucrative business for many thousands of the inhabitants, are, lead, copper, coals, and salt from Devonshire and Cheshire, Staffordshire-ware in considerable quantities, lime and limestone for agricultural purposes, chertstone for the glass manufactories, coarse earthen-ware, pig-iron, and cast metal goods, oak-timber and bark, and sail-cloth. The imports for the consumption of the County, and of the neighbouring districts, are principally hemp and flax, groceries of all kinds, wines and spirits, cotton, wool, and yarn, flints for the supply of the Staffordshire potteries, and various other materials for inland manufactures.

Nottinghamshire ranks high among the manufacturing Counties. The staple manufacture is hosiery, of which the town of Nottingham is the principal seat. Thread-lace and British lace are extensively manufactured, though these departments have suffered severely from the competition of the continental manufacturers. Many cotton-mills are dispersed through the County, and produce a supply of cotton-twist for the Manchester trade. Silk manufactures are steadily progressive, especially in Nottingham and its vicinity. Potteries of coarse earthen-ware have been successfully established at Sutton Ashfield, and a sail-cloth manufactory has long been in a flourishing condition at Retford. The malting business is carried on principally at Nottingham, Newark, and Mansfield, and yields supplies for home-consumption and exportation. Many breweries at Nottingham and Newark produce large quantities of malt-drink both for home-consumption and for exportation.

Nottinghamshire is remarkable for the great number of families of rank residing in it. The political division is into six Hundreds. It is in the Diocese of York, of which it forms an Archdeaconry, divided into four Deaneries, Nottingham, Bingham, Newark, and Retford. It contains 160 parishes, of which 135 are within the jurisdiction of the Archdeacon, 28 subordinate to the church of Southwell, and 7 to the Dean and Chapter of York.

This tract, when first explored by the Romans, formed part of the possessions of the British Tribe *Coritani*. After the departure of the Romans, it was early conquered by the Saxons, and became a portion of the Kingdom of Mercia. About four miles South-West of Nottingham, Brent's Hill, a huge mound, enclosed by fifteen parallel banks of earth, is regarded as a relic of British power and labour. At Oulton there are three tumuli, the largest of which is 53 feet in diameter. Until a few years ago, one of those singular hills, which bearing the name of Robin Hood's Hills, rise above Newstead Abbey, was surmounted by a rude seat with a canopy cut out of the solid rock. This curious piece of antiquity, to which popular tradition had given the name of Robin Hood's chair, was some years ago broken up to supply materials for a fantastic piece of architecture in

the park of Newstead. Numerous Roman roads traverse the County in various directions.

The annual value of real property assessed to the income tax in this County in 1815, amounted to £737,229.

The population, according to the Census of 1831, is 225,400, being an increase of 20 per cent. on the number ascertained in 1821. The amount of the poor rate is £106,707, being an increase of 13 per cent. on the rate of the preceding year.

NEWARK and EAST and WEST RETFORD are separately described.

Notting-
ham.

Nottingham, the County Town, in the Domesday survey contained 120 dwelling-houses. It stands on the steep ascent of a sandy rock, commanding a rich view over the vale of Belvoir and the wolds, bounded by the hills of Leicestershire. A small rivulet runs on the North, the Trent crossed by a stone bridge of nineteen arches on the South. The streets, of modern erection, are handsome and spacious. In the Western part of the town a Castle was founded soon after the Conquest, in which Mortimer, Earl of March, was seized by Edward III. in 1330. During the Great Rebellion, it was demolished by order of the Parliament, and on the Restoration, having been purchased from the Duke of Buckingham by the Duke of Newcastle, the latter laid the foundations of a modern building, which was burned to the ground during the tumults occasioned by the debates on the Reform Bill in 1831. Beyond the remains of the Northern wall of the ancient Castle is the spot on which Charles I. raised his standard on the 25th of August, 1642. Of the three Parishes into which the town is divided, St. Mary's is the largest. The Church is of pointed architecture, cruciform, and with a central tower. St. Peter's has a lofty spire; the body of the Church has been chiefly built since the Great Rebellion, during which it suffered material injury. St. Nicholas's was entirely demolished during that unhappy period, and the present edifice was built in 1678. The other public buildings are a County Hall, a Town Hall, Town and County Gaols, a Lunatic Asylum, a Theatre, and an Assembly Room. The Market-place is large and well constructed, having an Exchange on its Eastern side. The staple trade of the town consists in the manufacture of stockings, chiefly from silk and fine cotton; lace-making, coarse pottery, and malting also are carried on to a considerable extent, and the brewing of Nottingham ale is much celebrated. Tanning, which once employed many hands, is in decay. The town is a County of itself, and returns two Members to Parliament. Population, in 1801, 38,801; in 1831, 50,680. Distant from London 124 miles N.W.

Mansfield.

Mansfield is a Market Town in Sherwood Forest, once distinguished by a Royal Hunting seat, in which, during the occasional residence of one of our Monarchs, the incidents recorded in the well-known Ballad of *the King and the Miller of Mansfield* may have occurred. The trade is chiefly in corn, malt, and stockings. Population, in 1801, 5988; in 1831, 9426. Distant from Nottingham 14 miles N., from London 138.

Southwell.

Southwell is a Market Town, agreeably situated on a gentle eminence rising above the Greet, a small branch of the Trent. It is chiefly noted for its very ancient Collegiate Church, part of the remains of which on the Northern side are undoubtedly Saxon. Its Western front presents two lofty square towers. The screen at the entrance of the Choir is richly decorated, and the Chapter House is entered by a very beautiful arch. The

VOL. XXV.

dimensions of the Church are, length 306 feet, breadth 59, length of the transept 121. It suffered much during the Great Rebellion, but it has been discreetly restored. The Ecclesiastical endowment is for sixteen Prebendaries and six Vicars Choral, &c. On the South of the Minster Yard stand the remains of a Palace belonging to the Archbishops of York, once an extensive and magnificent building, destroyed by Sectarian fury during the Usurpation. It was in this town that Charles I. surrendered himself to the Scotch Commissioners on the 6th of May, 1646, and the room in which he dined on that day is still pointed out, on the left-hand side of the Gate-way of the Saracen's Head Inn. Southwell has a County Bridewell. Distant from Nottingham 13 miles N. E., from London 129. Population, in 1831, 3384.

NOT-
TING-
HAM-
SHIRE.

Tuxford is a small Market Town on the North Road. Distant 12 miles N. from Newark, 138 from London. Population, in 1831, 1113. The Church of St. Nicholas is a Vicarage in the gift of Trinity College, Cambridge.

Tuxford.

Worksop, a Market Town on the borders of Sherwood Forest, stands nearly in the centre of a district provincially known as *the Dukery*, from the vicinity of four Seats respectively belonging to the Dukes of Norfolk, Newcastle, Portland, and (while the title existed) Kingston. The town lies in a pleasant valley, near the source of a little stream, the Ryton; it is clean and well built, and distinguished by the remains of a splendid Augustin Abbey, founded by Henry I., part of the Church of which is still used for Parochial duty. The precincts are approached by a gateway of florid architecture. It is the Western end of the Priory Church which is in repair, flanked by two lofty towers, and consisting of a nave and two aisles, 135 feet in length. Worksop has considerable trade in the prevalent County manufactures, and is advantageously situated near the Chesterfield Canal. Distant from Nottingham 20 miles N., from London 142. Population, in 1831, 5566.

Worksop.

Worksop Manor, a seat of the Duke of Norfolk, The Dukery, adjoins the town, in an extensive and finely timbered Park, eight miles in circuit, and forming part of Sherwood Forest. An older mansion was burned down in 1761, and the existing structure was then commenced after the designs of Payne. Not quite one-fourth of the original plan was completed, and the present Corinthian façade, 318 feet in length, formed but one side of the intended quadrangle with two interior courts. Clumber Park, two miles South-East from Worksop, belongs to the Duke of Newcastle; the Park is eleven miles in compass, and the mansion, among the most complete in England, presents three fronts. Welbeck Abbey is a seat of the Duke of Portland, once a Præmonstratensian Abbey, founded in the reign of Stephen. The present building in its interior contains many of the original walls, externally it presents the bastard architecture of the early part of the XVIIth Century. The Stables and Riding House were built in 1623 by the Duke of Newcastle, so well known for his passion for Horsemanship: the chief stable contains 40 stalls, and its dimensions are 130 feet by 40. Thoresby Park is situated about a mile from Clumber Park. The House, which has little pretence to Architecture, was built in 1745 by the Duke of Kingston, ancestor of the present noble owner, Earl Manvers. The Park is thirteen miles in circuit, and contains a very magnificent sheet of water.

Other places of large manufacturing population are Arnold 4054; Basford 6325; Greasley 4583; Lenten

A little give

At first, that kindled, add a little more,

Till, by deliberate *nourishing*, the flame

Reviv'd, with all its wonted vigour glows.

Armstrong. *The Art of preserving Health*. Diet, book ii.

NOUSLE, v. Skinner writes *nuzzle*, corrupted from *nestle*. Lye. *Nuzzle*; *nasum aliquo indere*, from the D. *neuselen*, to search after with the nose or snout. *Nosel*, the dim. of nose. Steevens, on Pericles, would read *nursle*. A fondling, he observes, is still a *nursling*. To *nouzle*, or, as it is now written, *nuzzle*, is to go with the nose down like a hog. The application of the verbs to *nestle*, to *nursle*, and to *nuzzle*, border so close upon each other that it is difficult in some instances to discriminate the source of corruption. An infant may be said to *nestle*, to *nursle*, or to *nuzzle*, in the breast or bosom of its nurse or mother; and the general application seems to be

To creep closely or snugly into, (as a child with its nose nestles into the breast of its nurse,) to sink into, to lie closely or fondly, to cling fondly to, to hang or dwell fondly or doatingly upon; to fondle, to doat.

A *nousling* mole; a mole working its way with its nozle or nose.

NOU-
RISH.

NOUSLE

NOUSLE. Some be so sore *nowseled* in the false heresies, & in their obstinate frowardnesse take such a deuclishe delight, y^t finally thei die therin.

Sir Thomas More. *Workes*, fol. 587. *The Second Part of the Consutation of Tyndall*.

But when they were a while *nowseled* in that point first, they could abide and endure after many thynges moe.
Id. *Ib.* fol. 1175. *The Second Booke of Coumfort against Tribulation*.

The Egyptyanes whyche were the first authours of the false religion would neuer admit anye man in their presthode, that had not been *nowseled* vp from hys youth in the rules of that most fylthie ydoll Priapus.
Bale. Apologie, p. 5. col. i. *Epistle*.

Euer *nowelyng* them in ceremonies & in their owne constitutions, decrees, ordinaunces, and laws of holy church.
Tyndall. Workes, fol. 361. *The Practice of Popish Prelates*.

And Mole, that like a *nowsting* mole doth make
His way still under ground till Thames he overtake.
Spenser. Faerie Queene, book iv. can. 11.

The base people *nowseled* vp in the race and theaters, together with the worst sort of bondmen, and those which having eaten their owne liued only now vpon Neroes dishonours, hung down the head, and listned for nouelties.

Savile. Tacitus, book i. ch. iii. fol. 6.

Those mothers who, to *nowse* up their babes,
